1936

PREFACE

THE RINGING DOWN of the curtain on the year 1935 shut out a scene of bitter antagonism, political and personal rather than economic and industrial, for the like of which one must look back to the early years of our great Republic. Then, as now, men believed that human values were of far greater importance to the Nation's welfare than property values, personal possessions, or riches, and that before political differences could be satisfactorily adjusted the economic and industrial problems would have to be solved, and solved not by patch-work methods but by such adjustments of the body politic as would assure stable government.

The conditions through which we have passed have proved severe enough to test the mettle of man. The hardships and handicaps through which we have gone have helped us to build on a solid foundation for the future. These experiences have given us a sense of the responsibility and of the value of money; they have kept us from becoming unduly optimistic as well as prevented us from being altogether pessimistic.

In the entire circle of the year, no one came forward to prescribe a universal panacea for the ills of the time, world-wide though these have been, and, such as survive still are. But, by unanimous prescription, the Judicature of the United States Supreme Court shook to its very foundations the work done by Congress when passing the NATIONAL INDUSTRIAL RECOVERY ACT.

It is a matter of newspaper record that, in the course of the past year, the Administration was accused of Bolshevism or something akin to it, Communism, Fascism, Naziism, Socialism or some such other variety of -ism as may have been advocated in the eager rush that has been made to find some panacea for the ills of the world—those ills that we share in common without regard to race, creed, or color. Seldom or never has an Administration been credited with less worthy motives. The idea that it set out to better conditions generally, with the intention of pulling the masses out of that slough of despond, does not seem to have found favor, if ever it occurred to those engaged in the depreciation of all efforts made to build up.

Are the barbarities of life no crueler than its conflicts? Indeed, they are more so. The childishness and brutality of the times in which we live, with their attendant cruelty man to man, belong more to nations at war than to nations blessed with peace, and so the struggle between Labor and Capital continued. With us financial avidity is in continual conflict with commercial greed; for, no sooner does a commercial enterprise succeed in establishing itself than we find the ambassadors of high finance outside the door, knocking for admission and ready to exploit or to inflate that success to the point of expansion that commonly leads to a crash. Surfeits of mutual indulgence such as we experienced in the past could not continue in 1935 any more than they could continue in 1865, when the cost of the necessities of life, commodities, and clothing rose beyond the price of purchase and could be obtained only by barter.

Such are some of the thoughts that the reading of the record of the year 1935 has awakened—a record through which the joy of life has run briskly side by side with its trials and troubles, its terrors and its tragedies.

Bared of all glamour, the record of facts that follows is presented with all the frankness at the command of those who glory in the freedom of the pen with which they write and of the press through which they publish. Whether or not the benefits received outbalance the liabilities incurred some things are certain—there have been readjustment and recovery; conservation and relief, all of which may be credited to the efforts of one man of outstanding personality, who, when the storm of depression threatened to overwhelm the ship of State, was summoned to serve as pilot, and steered such a course between rocks and shoals as to bring his ship into the open though turbulent sea.

Political unrest marred the measure of economic progress that was attained during the year. This affected the leading nations of the world and was evident in the United States, France, Germany, Great Britain, and Italy. In a lesser degree it was present in Austria and even in the most peaceful of all the nations of the world, Switzerland. Discontent over the progress made characterized dissension in the United States; the return to office of a large Conservative majority by the electorate of Great Britain showed the dissatisfaction of the proletariat with things as they had been, and this threw out of office members who were representatives of the Labor interests if not members of the party. Late in the year the unrest acquired additional strength in Britain through the fear of war that had seized the Secretary of Foreign Affairs. This fear led him into the position of a statesman reduced to playing politics, and such poor politics as felt the force of public indignation when revealed.

Empowered by the Coördination Committee of the League of Nations at Geneva to draft a peace plan to be submitted to the three parties concerned in the African War—Italy, Ethiopia, and the League of Nations—the British Foreign Secretary, SIR SAMUEL HOARE, and the French Prime Minister, M. LAVAL, drew up proposals that, according to their views, would have given to Ethiopia an outlet to the Sea, and more than she will be likely to get if defeated by Italy, and to the Italians much less than the Italian Government demanded before it began hostilities. But the idea that an aggressor nation should be rewarded for its aggression at the expense of the nation whose territory it had invaded was repulsive to both the British and the French people. The clamor raised appalled the British Prime Minister, STANLEY BALDWIN, who determined that it could be stilled only by prompt and effective action. The Foreign Secretary tendered his resignation and it was accepted. His proposals were repudiated by the Prime Minister who declared that much harm had been done and that he was "determined that such a position should not be possible again." The fall of the French ministry was expected to follow immediately but did not occur before the close of the year.

PREFACE

The danger into which British politicians had led their country, and one possible result of the wrangling over the bringing about of peace between the Italians and the Ethiopians, was the imperiling of the existence of the League of Nations. Amazing as this was it was nothing to the indignation of the press and the clamor of the people when it found itself betrayed by its own ministries. An interesting sidelight of this period was cast by the word *Sanctions* which was played up in the press almost as freely as the word *sophisticated* had been years before. To the man in the street "Sanctions" was nothing more than an expression of disapproval indicated in a ladylike way. Alas, that English diplomacy and statesmanship should descend to the use of euphemistic terminology. Here was a case in which the public had been fooled through the using of soft-sounding terms that had ugly meanings and still uglier implications. Having proposed one thing and done another no wonder the public was incensed. The French people too were not slow in condemning their ministers.

In France the ever effervescent spirit of the masses asserted itself over diplomatic and official circles, and men and parties strove to do their best to steady the ship of State and to muffle the mutterings over economic conditions that, before the year lapsed, showed only a modicum of improvement.

In Germany, the agitation around the return of the Saar to the Reich having subsided, after a convincing plebiscite, another was fomented by restrictions on liberty of worship, and by renewed oppression of the Jews. Amazing as these conditions proved to be they awoke compassion for a suffering people, and at the time of writing steps had been taken to bring relief to the oppressed by migration *en masse* to other lands.

In view of the foregoing comments, the Reader will welcome the various illuminating contributions on INTERNATIONAL RELATIONS and FOREIGN AFFAIRS from the able pen of MR. RONALD S. KAIN, Associate Editor in charge. MR. KAIN reports the following as outstanding events in his department:

The Franco-Italian accord of Jan. 7, 1935, ended 15 years of dangerous friction between the two nations in Europe and Africa and completed, temporarily, the isolation of Germany. Chancellor Hitler's unilateral repudiation of the Versailles Treaty in decreeing restoration of military conscription on March 16 led to the Stresa Conference of April 11, 14, where an Anglo-French-Italian front designed to prevent further treaty violations was established. The Franco-Soviet mutual assistance pact signed May 2 added another powerful link to the French chain of alliances forged against Germany.

The Stresa front was soon shattered, first by the Anglo-German Naval Treaty of June 18, through which Britain openly abetted Germany's repudiation of the naval limitations imposed by the Versailles Treaty, and again by Italy's aggression upon Ethiopia, commencing October 3. Mussolini's Ethiopian adventure, launched in bold violation of the League Covenant, the Kellogg-Briand Pact, and the Italo-Ethiopian arbitration treaty of 1928, brought Britain and Italy, and with them all Europe, to the verge of war. It precipitated the first attempt by the League States to restrain and punish an aggressor through the collective application of economic and financial sanctions.

Britain, by her firm opposition to Italy at Geneva, seized the leadership of Europe from France. The latter, weakened by factional strife and deepening economic depression at home, saw both her prestige and her security against Germany sink to the lowest level since the World War. Meanwhile, the opportunity presented by Europe's absorption in the Ethiopian dispute was seized by Germany to hasten her rearmament and by Japan to extend her control over additional provinces in North China and Mongolia. This menace from both Germany and Japan explained the abortive Hoare-Laval peace proposals of December, designed to buy off Italy at the expense of Ethiopia and restore the Stresa front.

Against this background should be viewed the feverish and world-wide arming of the nations, the complete collapse of the Geneva Disarmament Conference; the unofficial British peace ballot, with its overwhelming endorsement of the League of Nations and of the idea of collective security based upon economic and military sanctions; the victory of the Conservatives on a rearmament platform in the British general election of November 14, and Japan's demand for parity at the London Naval Conference, which opened December 9.

Other notable trends and events of the year were: The general economic recovery in practically all countries except those adhering to the gold standard and to deflationary policies; the sturdy resistance offered the further expansion of fascism, particularly in France, Spain, and Japan, the countries most threatened with Fascist rule, the Liberal triumph in the Canadian general election, followed by the conclusion of an important Canadian-American reciprocal tariff treaty on November 15; termination of the Chaco War, the end of Gen. Juan Vicente Gomez's 27-year-old dictatorship in Venezuela; the abortive radical revolt of November in Brazil, the clash between President Cardenas and ex-President Calles in Mexico, and establishment of the Philippine Commonwealth on November 15. Also, the restoration of the monarchy in Greece, effective October 10, the resignation of President Masaryk, Czechoslovakia's great statesman, and the election of Eduard Benes as his successor on December 18, the death of Marshal Pilsudski, dictator of Poland, on May 12, the substantial economic recovery in Belgium following the abandonment of the gold standard and devaluation of the belga on March 29, the passage of the Government of India Bill by the British House of Commons June 5; Labor's victory in the New Zealand elections of November 27, and the revival of the violent nationalist agitation in Egypt.

On developments in our land, MR. PHILIP COAN, in charge of the Department of the UNITED STATES as a whole, and of the forty-eight STATES and ALASKA, contributes the following able succinct summation:

The fortunes of the great Federal venture into new realms of government were still the centre of interest in the United States and the foremost common concern of its citizens. The "New Deal," checked and disconcerted in some of its chief purposes by the SUPREME COURT, advanced aggressively in other directions; thus it employed the taxing power for the gradual exhaustion of the conceived excess of great concentrations of private wealth, and it laid new taxes to support a permanent system of regular benefits to the superannuated poor and to persons cast out of employment.

A competing influence on the course of national affairs was the increasing well being of the people as a whole. This improvement, plausibly due in great part to two years' outpouring of Federal funds for the so-called pumping of the economic pump, had been erratic and often dubious, until the middle of 1935; thereafter it became increasingly manifest in many fields. Economic betterment, by rendering taxes more prolific, aided the Federal Government and the States as well. But the temper of the people grew cooler to radical proposals as crops grew more profitable and industries became busier, response to the Federal Administration's grievance against the Supreme Court and the Constitution lacked fervor, and criticism of the unabated Federal expenditure and deficits began to spread.

The tide of the Nation's affairs was therefore diverse, intricate, and difficult to judge as to its general course - a matter of import to the people, universally and severally.

To MR. LOUIS M. HACKER the Editor is indebted for the following views related in part to the work in his various studies in ECONOMIC, SOCIAL, and POLITICAL SCIENCE:

The SUPREME COURT decision declaring the National Recovery Act unconstitutional was an outstanding event of 1935, especially since it precipitated chaos in so many fields, including labor relations, child labor, and alcohol control. Order was restored in some of these before the year closed, but the important matter of child labor was returned to *status quo ante*, which led to the revival of the campaign for a prohibitory constitutional amendment. Of al-

PREFACE

most equal importance was the passing of the Social Security Act, which will be of fundamental importance in the future in the fields of old age pensions, care of dependent children, and unemployment insurance, multiplying the number of State statutes in these fields, bringing a large measure of uniformity to them, and underwriting to some extent the allowances provided by them. Governmental control of labor relations continued to the fore with the establishment of the National Labor Relations Board. Other significant events in various fields were the appearance of marked divisions of sentiment in the labor union and socialist fields, the former over the question of industrial unions, the latter over tactics in the period of social chaos which is adjudged to be prospective, the continuation of the strike wave in the United States, outstanding occurrence of the year being the Terre Haute general strike, the attempt of the Federal Government to liquidate the relief problem by an enormous works programme, the expansion of the cooperative movement, the marked decline of emigration; the increase in the number of lynchings; the conviction of Bruno Richard Hauptmann for the murder of the Lindbergh baby; the revival of dry sentiment and propaganda, the intensification of the persecution of the Jews in Germany and the continued development of Palestine as a Jewish national home, and the attempts of the Nazi Government to tighten its grip on German labor.

MR. CHARLES E. FUNK, Associate Editor in charge of the MINERAL DEPARTMENT, reports that in virtually all fields of mineral production the year showed substantial progress toward recovery:

Steel ingot production in the United States advanced 30 per cent over the previous year, pig iron 33 per cent, gold 15 per cent in all directions production, and its necessary adjunct, consumption, was higher than in any year since 1929 and some minerals closely approached that peak year. Contrary to the artificial spurt in 1933, induced by the replenishment of stocks against the fear of great advances in price, the stimulus in 1935 seemed to rest on the solid basis of actual market demand. Though the recovery movement was world wide, it was more noticeable in the United States where the movement had been slower in gaining headway.

As DR LESLIE SPIER of Yale University has ably pointed out, the year 1935 was a very sober one in his field, ANTHROPOLOGY. There was a noticeable growth in the number of anthropologists, especially in this country, in the past few years, and their labors are now bearing fruit. Dr. Spier was impressed by the amount of activity in the Soviet Union.

GEN JOHN J. BRADLEY, contributor of the article on MILITARY PROGRESS, summed up developments in this field as follows.

Unrest has marked the past year throughout the world. Momentous changes in thought and action along defensive and aggressive military lines have resulted in madly pressed military preparations on land, sea, and in the air.

One striking aspect has been the militarization and instruction of the children and youth of the world in Italy, Germany, Russia, Japan, and making obligatory military training prerequisites for graduation in grade, intermediate, and university classes.

All nations, except the United States, have prepared for gas and bombing expeditions, with compulsory drill of populations in protective measures. Extensive galleries and bomb-proof construction have been provided, with plans developed for moving whole populations from danger spots. While there is no immediate threat, danger lurks everywhere. Russia fears further Japanese expansion in China Outer Mongolia, skirting the Soviet Russia frontier, if occupied by Japan would place her hostile military forces within striking distance of the all important Trans-Siberian Railway connecting Moscow with Vladivostok. Russia also faces danger of attack by Germany from the rear should Japan strike. Great Britain evidently fears Germany and Italy. Germany flouts the Versailles Treaty, rearms and prepares her military machine feverishly. Whom she will strike is uncertain. Great Britain prepares to abandon her impregnable Malta and covets Crete. Italy makes progress in Ethiopia. The United States abandons the Philippines.

On conditions in the field of PSYCHOLOGY, DR. GORDON W. ALLPORT, of Harvard University, makes the following illuminating comments:

It has often been prophesied that the twentieth century will witness as great advances in mental science as the nineteenth century witnessed in biological science. The prophecy seems to be coming true. The revolution in thought marked by the rise of the Gestalt school has given new incentive and new direction to almost every branch of psychological work. During the past year this development has been greatly accelerated in the United States by the combining of forces of American investigators with those of the distinguished German scholars who, for political reasons, have taken up their residence in this country. Coupled with the re-orientation of systems and theories is the new interest of psychologists in the application of their science. To a large and significant proportion of the profession the problems of social reconstruction are no longer viewed as outside the range of legitimate scientific concern.

In the Department of ANIMAL HUSBANDRY, DR. GEORGE HAINES, of the United States Department of Agriculture, besides discussing the latest phases of Dairying, Livestock, and Wool, reported that:

Reduced pork production in the United States, a condition rendered more acute by a reduction in hog numbers in European importing countries, was the most important factor in the livestock situation of 1935. Limitations on imports of meat by the United Kingdom and fats by Germany, are playing an important part in modifying production in meat and lard exporting countries.

MR. FRANCIS D. PERKINS, assistant music critic of the *New York Herald Tribune*, gives the following résumé of the world of MUSIC.

The United States Government, for the first time, undertook support of musical activities on a large scale with the Federal Music Project, inaugurated in August to meet the long existing and serious problem of unemployment among professional musicians. Free concerts of various kinds and recreational and social activities were the principal undertakings directed by the Project for this purpose, while it was also planned to give representation in these concerts to American composers and appearances to promising, while not yet well known, executant musicians, helping to offset the handicap faced by both these groups in the regular musical field.

The year also brought the close of the twenty-seven year régime of Giulio Gatti-Casazza as general manager of the Metropolitan Opera Association of New York. With the support of the Juilliard Musical Foundation, America's senior opera company was enabled to tide over its fourth annual economic crisis and begin the 1935-36 season with Edward Johnson, Canadian-born tenor, as the new general manager. A movement toward the presentation of opera by symphony orchestras of other American cities as part of their regular curricula, which promised to be of considerable importance in the fall of 1934, received a setback when the Philadelphia Orchestra, which had made the most ambitious experiment of this kind, decided in the spring to abandon it on account of the cost. Opera, however, was continued in the 1935-36 schedules of the Cleveland and Detroit Symphony Orchestras, and was taken up for the new season by the Cincinnati Symphony.

The most publicized new work to receive its world première in 1935 was probably *Die Schwiegswasse Frau* by Richard Strauss, first produced in Dresden, Germany on June 24. Soon afterward, Strauss resigned the position which had made him one of the principal figures in the official world of German music, the presidency of the Reich Music Chamber and the chairmanship of the League of German Composers. Official disapproval of his collaboration with the Austrian-Jewish author, Stefan Zweig, in this opera, was believed to be a factor in this step, although that was not the composer's publicly announced reason for his resignation.

PREFACE

The year was unusually rich in prominent anniversaries, including the 250th birthdays of Bach and Handel, and, among living composers, the seventieth birth of Jean Sibelius. These anniversaries were widely observed by musical organizations both in Europe and America.

In the DEPARTMENT OF BIOGRAPHY, MISS HELEN READY BIRD, Associate Editor in charge, reports that death took his usual toll of the noted throughout the year, and of the many eminent men and women who "shuffled off this mortal coil" may be mentioned:

Juan Vicente Gomez, dictator of Venezuela for more than a quarter of a century; the Marquis of Reading, one-time Viceroy of India; Huey P. Long, American Senator and "Kingfish" of Louisiana; Jane Addams, American sociologist and founder of Hull-House; Astrid, Queen of the Belgians; Francis Cardinal Bourne, well-known prelate of the Roman Catholic Church in England; William "Billy" Sunday, American evangelist; James H. Breasted, American Orientalist and founder of the Oriental Institute; Henry Fairfield Osborn, American paleontologist and former president of the American Museum of Natural History; Hugo De Vries, Dutch botanist and exponent of the Mutation Theory; Michael I. Pupin, American physicist and inventor; Dr. John R. Macleod, co-discoverer of insulin and Nobel Prize winner; Dr. Franklin H. Martin, American physician and one of the founders of the American College of Surgeons; Gustav Lindenthal, American engineer; Lord Byng, the hero of Vimy Ridge; Admiral Jellicoe, British commander at the Battle of Jutland; Gen. Hunter Liggett, commander of the First Army of the American Expeditionary Forces; Col. T. E. Lawrence, romantic figure of the Arabian campaigns; De Wolf Hopper, much-married American comedian; Robert Loraine, British Shavian actor; Alexander Moissi, celebrated German actor; Adolph S. Ochs, editor and publisher of *The New York Times*; Louis Wiley, business manager of *The New York Times*; George Earle Buckle, editor of the *London Times*; Mikhail Ippolitov-Ivanov, Russian composer; Alban Berg, Austrian modernist composer; Marcella Sembrich, Polish-American operatic soprano; Herbert Witherspoon, American singer and newly-appointed manager of the Metropolitan Opera Association; Henri Barbusse, French radical author; Paul Bourget, a survivor of a French literary school; Edwin Arlington Robinson, American poet; George W. Russell, "A.E.", Irish mystical poet; Childe Hassam, American artist; Gaston Lachaise, Franco-American sculptor; Max Liebermann, dean of German painters; Will Rogers, American humorist; Col. Alfred Dreyfus, of the French *cause célèbre*; Gen. Adolphus Greely, American Arctic explorer; Annie S. Peck, American mountain climber; Gen. William W. Atterbury of the Pennsylvania Railroad; André Citroën, French "Henry Ford"; Edward L. Doheny, American oil baron; Carl Duisberg, German industrialist; Emile Francqui, Belgian banker and authority on international finance; Hugo Junkers, German aeronautical engineer; Sir Charles Edward Kingsford-Smith, Australian Trans-Pacific flyer; and Wiley Post, American aviator known for his globe-circling flights.

The Editor regrets to announce the retirement of MR. WILLIAM AGAR, who supplied the article on GEOLOGY and who has become headmaster of the Newman School, Lakewood, N. J.; MR. WILLIAM E. BERCHTOLD, who supplied the article on AERONAUTICS, and MISS MARY CLAPP, in charge of the BIOGRAPHICAL DEPARTMENT.

He takes pleasure in welcoming DR. GREGG DOUGHERTY of Princeton University, who has supplied the article on BIOLOGICAL CHEMISTRY; DR. PHILIP KRIEGER of Columbia University, who has developed GEOLOGY; MR. EDWARD P. WARNER, former Vice Chairman of the Federal Aviation Commission, who has treated the various phases of AERONAUTICS; and DR. BENJAMIN WERNE, Supervisor of Municipal Research, New York University School of Law, who has contributed an article on MEDICAL JURISPRUDENCE.

Appreciative thanks for obligation incurred and courtesies received are offered to the Officers of the various Departments of the United States Government and their allied Bureaus; also, to the Officers of those other Governments who have supplied much information concerning their respective countries; to MR. WILLIAM P. BANNING, of the American Telephone and Telegraph Company; and to each and every Association, Company, Corporation, or other Institution that has contributed material which will serve to maintain the high degree of accuracy required of this work.

For efficient aid in collaboration and correlation, and for watchful care in transcription in the various stages through which the work has passed, sincere thanks are tendered to my esteemed associate in editorial direction, HELEN READY BIRD, whose vigilance has maintained the standard of accuracy for which the NEW INTERNATIONAL YEAR BOOKS have long been noteworthy. In this work, she has been most ably aided by MR. HENRY E. VIZETELLY, and the CONTRIBUTORS and ASSOCIATE EDITORS in charge of the various departments that have made this work popular in every reference library, educational institution, newspaper office, and private home throughout the country.

KEY TO PRONUNCIATION

ā	as in ale, fate. Also see ē, below.	ɒ	as in the Spanish Almodovar, pulgada, where it is nearly like th in English then, this.
ä	" " senate, chaotic.	g	" " go, get.
ā	" " glare, care, and as e in there. See ē, below.	g	" " the German Landtag, and ch in Feurbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
ā	" " am, at.	h	" j in the Spanish Jijona, g in the Spanish gila; where it is a fricative somewhat resembling the sound of h in English hue or y in yet, but stronger.
ā	" " arm, father.	hw	" wh in which.
ā	" " ant, and final a in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short u (ū).	k	" ch in the German ich, Albrecht, and g in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of h in hue, or y in yet; or the sound made by beginning to pronounce a k, but not completing the stoppage of the breath. The character x is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of kh in the word Khan.
æ	" " final, regal, where it is of a neutral or obscure quality.	n	" " in sinker, longer.
æ	" " all, fall.	ng	" " sing, long.
æ	" " eve.	n	" " the French bon, Bourbon, and m in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by ñ, as in the case of São Antão.
æ	" " elate, evade.	sh	" " shine, shut.
æ	" " end, pet. The characters ē, ā, and ä are used for d, ae in German, as in Baedeker, Gräfe, Handel, to the values of which they are the nearest English vowel sounds. The sound of Swedish a is also sometimes indicated by ē, sometimes by ä or d.	th	" " thrust, thin.
ē	" " fern, her, and as i in sir. Also for é, oe, in German, as in Gothe, Goethe, Ortel, Oertel, and for eu and oeu in French, as in Neufchâtel, Crêvecoeur; to which it is the nearest English vowel sound.	th	" " then, this.
é	" " agency, judgment, where it is of a neutral or obscure quality, ē.	zh	" z in azure, and s in pleasure.
ī	" " ice, quiet.		An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kǎz'm (chasm).
ī	" " quiescent.		Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
ī	" " ill, fit.		When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in THE NEW INTERNATIONAL ENCYCLOPÆDIA and in the NEW STANDARD DICTIONARY.
ō	" " old, sober.		
ō	" " obey, sobriety.		
ō	" " orb, nor.		
ō	" " odd, forest, not.		
o	" " atom, carol, where it has a neutral or obscure quality.		
oi	" " oil, boil, and for eu in German, as in Feuerbach.		
oo	" " food, fool, and as u in rude, rule.		
oo	" " foot, wool.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as oo in foot, book. Also for u in German, as in Munchen, Muller, and u in French, as in Buchez, Budé; to which it approximates in English.		
ū	" " urn, burn.		
y	" " yet, yield.		
h	" " the Spanish Habana, Córdoba, where it is like a v made with the lips alone, instead of with the teeth and lips.		
ch	" " chair, cheese.

ACADEMIC FREEDOM. See EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635, reorganized in 1816. The membership is limited to 40. At a meeting in the Louvre on June 18, 1935, the Academy celebrated its 300th anniversary. The French dictionary, begun on Nov. 5, 1885, was completed on Sept. 5, 1935. The list of the Immortals at the beginning of 1935, in order of their election, was as follows: Paul Bourget (q.v.), Gabriel Hanotaux, Henri Lavedan, Maurice Donnay, René Doumic; Marcel Prévost, Henri de Régnier, Henri Bergson, Mgr Alfred Baudrillart, Jules Cambon (q.v.), Henri Bordeaux, Joseph Bédier; André Chevrillon, Pierre de Nolhac, Georges Goyau, Edouard Estaunié, Henri Robert, Georges Lecomte, Émile Picard, Louis Bertrand, Auguste de Caumont, Duc de la Force; Paul Valéry; Abel Hermant, Émile Mâle; Louis Madelin, Maurice Paléologue, le maréchal Henri Pétain, André Chaumieux, Gen. Max Weygand; Pierre Benoit, Abel Bonnard, Lenôtre (L. T. T. Gosselin), François Mauriac, Maurice, Duc de Broglie; Léon Bérard, and le maréchal Louis Franchet d'Espèrey. At the meeting of the Academy on Mar. 28, 1935, Claude Farrière, marine officer and novelist, succeeded to the chair of Louis Barthou, Jacques Bainville, journalist, to that of Raymond Poincaré, and André Bellesort, editor and critic, to that of Abbé Brémond. At the meeting of Nov. 21, 1935, Georges Duhamel, the novelist, was elected to the chair of Georges Lenôtre, and Louis Gillet, art critic and authority on English and American literature, succeeded Paul-Albert Besnard. See PHILOLOGY, MODERN.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters for the purpose of furthering and representing the interests of literature, painting, sculpture, architecture, and music. Its membership is limited to 50 chairs, vacancies caused by death being filled by election from the membership of the Institute.

The membership of the academy as of Nov. 14, 1935, consisted of the following in the order of their election: Robert Underwood Johnson, Edwin Howland Blashfield, George de Forest Brush, Bliss Perry, Abbot Lawrence Lowell, Nicholas Murray Butler, Owen Wister, Herbert Adams, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Elihu Root, Hamlin

Garland, Archer Milton Huntington, Lorado Taft, Newton Booth Tarkington, Charles Dana Gibson, Royal Cortissoz, Henry Hadley, Charles Downer Hazen, Wilbur L. Cross, Herman A. MacNeil, John Russell Pope, James Earle Fraser, John Huston Finley, William Mitchell Kendall, Edwin Markham, Robert Frost, James Truslow Adams, Edith Wharton, George Grey Barnard, William Lyon Phelps, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paulanship, Cecilia Beaux, Eugene O'Neill, William James Henderson, Henry Dwight Sedgwick, Walter Gay, and Walter Lippmann.

At the annual meeting, Nov. 14, 1935, Frederick J. E. Woodbridge, M. A. DeWolfe Howe, Frank J. Mather, Jr., Stewart Edward White, Deems Taylor and Sidney Howard were elected to membership.

Agnes Repplier, member of the National Institute of Arts and Letters, delivered the sixteenth address on the Evangeline Wilbour Blashfield Foundation in commemoration of the Horatianum Bimillennium. In connection with the six months' exhibition of the paintings of Cecilia Beaux there occurred the opening for the second season of the permanent Museum of the Academy and the Institute. This year the Museum features a special Mark Twain Exhibit and for the first time in America an exhibition of the Brand Whitlock Collection.

An Orchestral Concert was given on the evening of November 15 by Members of the Philharmonic Orchestra, Henry Hadley, member of the Academy, conducting. This is the eighth of a series of Concerts of American Music by American Composers.

The Howells Medal for Fiction was awarded on November 14 to Pearl S. Buck for her novel *The Good Earth*. Miss Lynn Fontanne was the recipient of the Academy's medal for Good Diction on the Stage and Mr. Alois Havrilla of the National Broadcasting Company received the medal for Good Diction on the Radio.

The officers of the academy in 1935 were: President, Nicholas Murray Butler, chancellor and treasurer, Wilbur L. Cross, secretary, Robert Underwood Johnson, directors, Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, William Lyon Phelps, Archer Milton Huntington. Administrative offices are at 633 West 155th Street, New York City.

ACCIDENTS. See AERONAUTICS; MARINE DISASTERS; RAILWAY ACCIDENTS; WORKMEN'S COMPENSATION.

ADDAMS, JANE. An American sociologist, died in Chicago, May 21. Born at Cedarville, Ill., Sept. 6, 1860, she graduated from the Rockford

Female Seminary in 1881, and later attended the Philadelphia Medical School, but illness caused her to leave at the end of a year. Upon regaining her health she went to Europe and traveled extensively in France, Italy, Germany, Switzerland, Spain, and England, where she became interested in the living conditions of the poor. Finding the slums so horrible she determined to devote herself to the work of alleviating the sufferings of the poor. With this end in view she returned to America, and with Miss Ellen G. Starr, sought a house in Chicago in which to begin her work. The Hull mansion which, when originally built, had stood on the outskirts of the city, was then in a congested neighborhood, and so was found to be satisfactory.

With the aid of several young women, Hull-House was opened to the public in 1889. A centre was formed through which the workers could fraternize with the immigrants in the neighborhood, first by social calls, later by cooking classes, debates, and by summer outings. Out of these activities grew Hull-House, the first social settlement in the United States, with Miss Addams at its head as worker and guiding spirit. In 1894 the House was incorporated and its purpose, as stated in its charter, was "to provide a centre for the higher civic and social life; to institute and maintain educational and philanthropic enterprises and to investigate and improve conditions in the industrial districts of Chicago."

The old Hull mansion was quickly outgrown and a succession of buildings was added. These include a gymnasium, an art gallery, various club houses, the labor museum, a theatre, and workshops where handicrafts and trades were taught. Part of the outlay for the support of the establishment was met by rents, fees, and a small endowment; the other part obtained through contributions of the public.

The work done by Miss Addams led her into the labor movement and soon Hull-House was the centre of civic reform. It was here that the shirt-makers and cloak-makers found sympathy in their efforts to organize against the sweatshop, and it was through the conciliatory measures of Miss Addams that the Pullman strike of 1894 was arbitrated and settled, and led to the demand for the establishment of a State board of arbitration. The leaders of Hull-House agitated for a juvenile court, the exclusion of politics from the city's sanitary bureau, the opening of playgrounds, vacation schools, and the promotion of industrial education. The U. S. Department of Labor's investigation of Chicago slums was begun at Hull-House, and led to the demand for the model tenement code established by the city.

Miss Addams had less sympathy with theoretical studies of social problems than with everyday experience with all sorts and conditions of people. Her practical common sense, great executive ability, and fine unselfish spirit made her the natural leader of the settlement movement in this country. She took an active interest in city administrative problems and served for three years as inspector of streets and alleys in the district around Hull-House.

Always an opponent of war, Miss Addams was interested in the various peace movements, and in January, 1915, at the formation of the Woman's Peace Party, she was chosen president. Three months later she helped to organize and became president of the Woman's International Peace Congress, later known as the Woman's International League for Peace. She held the office of president until 1929, when she became honorary

international president. The first Congress of the League was held at The Hague in 1915, and after it ended, Miss Addams tried to interest the rulers of Europe in a peace programme, but without success. Even after the entry of the United States into the World War she did not stop denouncing war and as a result was criticized by many for what they deemed lack of patriotism.

In 1931, Miss Addams, in conjunction with Dr. Nicholas Murray Butler, the president of Columbia University, received the Nobel Prize for peace. In conferring the award, Prof. Halfdan Korth said: "Miss Addams does not speak much, but her quiet, kind-hearted personality creates an atmosphere of good-will which instinctively calls forth the best in us." The universities of Yale, Wisconsin, and Chicago recognized her achievements with honorary degrees, and in 1931 she was awarded the M. Carey Thomas prize of \$5000 given by Bryn Mawr College, "to an American woman in recognition of eminent achievements." In this same year, *Pictorial Review* gave her its annual \$5000 achievement award, and a jury selected by *Good House-keeping* named her as one of the nation's 12 greatest women. On May 2, 1935, a dinner was held in her honor by the Women's International League for Peace. This was attended by Harold L. Ickes, Secretary of the U. S. Department of the Interior, who availed himself of this occasion to speak of Miss Addams in the highest terms, and said in part, "Miss Addams does not talk about the Christian virtues, she practices them. She does not find it in her comprehending heart to preach; she lives in gracious fellowship and human understanding with persons of all races, of all colors, of all creeds."

Besides being a frequent contributor to newspapers and periodicals on social questions of the day, Miss Addams wrote: *Democracy and Social Ethics* (1902); *New Ideals of Peace* (1907); *The Spirit of Youth and the City Streets* (1909); *Twenty Years at Hull-House* (1910); *A New Conscience and an Ancient Evil* (1911); *The Long Road of Women's Memory* (1916); *Peace and Bread in Time of War* (1922); *The Second Twenty Years at Hull-House* (1930); *The Excellent Becomes the Permanent* (1932); *My Friend, Julia Lathrop* (published posthumously in 1935).

ADELPHI COLLEGE. A nonsectarian college of liberal arts for women located in Garden City, New York, incorporated in 1896. Adelphi was located in Brooklyn, New York, until the autumn of 1929 when it moved to its new home in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1935 was 404 and for the summer session of 1935 was 47. The faculty numbered 33. The endowment was \$894,540, while the income for 1934-35 was \$162,481. The Library contained 35,200 volumes. Courses in Art, Music, Dramatic Art, Business Administration and Social Service were added to the curriculum in the fall of 1935. President, Frank Dickinson Blodgett, LL.D.

ADEN, a'den; a'den. A British fortified seaport and peninsula in southwest Arabia. Area of the peninsula, 75 sq. miles; including Aden Protectorate and the Hadramaut (under loose British control), 42,000 sq. miles; the island of Perim, 5 sq. miles. Population of Aden and Perim, 51,478 (1931 census).

Production and Trade. Aden is a free port and the chief commercial centre for the Arabian peninsula. It is primarily a transshipment port and produces little itself aside from the manufacture

of salt, cigarettes, and dhow building. During 1933-34, total imports were valued at Rs53,283,625 and included fuel oil, gasoline, kerosene, cotton piece goods, gums, hides and skins, grains, coffee, tobacco, fruits, vegetables, etc.; total exports, Rs35,203,008 (including treasure, Rs3,023,269), the items being the same as those for imports given above. Merchant ships entering the port in 1933-34 aggregated 6,367,139 net tons; local craft entered in the same year totaled 43,630 tons.

Government. For 1933-44, total revenue amounted to Rs1,073,625; expenditure, Rs1,128,977 (rupee averaged \$0.3788 paper for 1934). Aden was made a separate province of India under a chief commissioner (from Apr. 1, 1932). The Aden Protectorate is controlled by the British Colonial Office in London by the Chief Commissioner and Commander-in-Chief of Aden (in 1935, Lieut.-Col. Sir Bernard Reilly who was succeeded by Lieut.-Col. M. C. Lake).

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. An organization founded in 1926 to serve as a national clearing house of information concerning adult education activities.

Funds supplied by the Carnegie Corporation of New York and the General Education Board have been used for continuing cooperative relations with the United States Office of Education in respect to the emergency educational programme of the Federal government (see pages 2 and 3 of *THE NEW INTERNATIONAL YEAR BOOK* for 1934). The Carnegie Corporation of New York has been the chief source of funds for other studies and demonstrations.

The current programme of demonstrations includes forums for adults conducted experimentally at Des Moines, Iowa, Springfield, Massachusetts, and Hartford, Connecticut, an Institute of Rural Economics at Rutgers University; programmes designed to strengthen the community approach to adult education in New England, California, Denver, New York City, and Leona, New Jersey; field service for these and similar groups; experiments in the training of leaders at Teachers College, Columbia University, and the Division of General Graduate Studies, Yale University; an experimental programme for youth conducted by the Civic Federation of Dallas; work with little theatre and similar groups through the National Theatre Conference; and programmes for the physically handicapped through the Saranac Lake Study and Craft Guild. Studies in progress relate to the simplification of printed materials for adults of limited education; the place of music in adult education; the place of science in adult education; the abilities of adults as exemplified by students in university extension classes; case histories of adult students (with the British Institute of Adult Education); and needed research in adult education. Here also should be mentioned two books now in preparation: revision of the *Handbook of Adult Education* (first issued in 1934) and a volume of readings designed to illustrate all aspects of adult education with particular reference to the United States.

The most important publications issued or sponsored by the association in 1935 were: *Ten Years of Adult Education*, by Morse A. Cartwright; *Adult Interests*, by E. L. Thorndike; *The American Way*, by John W. Studebaker; *Science and the Public Mind*, by Benjamin C. Gruenberg; *What Makes a Book Readable?* by William S. Gray and Bernice E. Leary; *The School in the Camps*, by Frank Ernest Hill; *Aspects of Post-*

Collegiate Education, by Ralph A. Beals. Twelve pamphlets on the Adjustment Service of New York. The *Journal of Adult Education* was published four times a year.

At the tenth annual meeting of the association, the following officers were elected: Charles A. Beard, president; James E. Russell, chairman; Everett D. Martin, Remsen D. Bird, Harvey N. Davis, Matthew S. Dudgeon, Alain Locke, William A. Neilson, John W. Studebaker, and George F. Zook, vice-presidents; Jennie M. Flexner, secretary; and Harold Stonier, treasurer. Headquarters: 60 East Forty-second St., New York City.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. An organization founded in 1848 to advance science, to give a stronger and more general impulse and systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. On Sept. 30, 1935, its membership included 17,937 cooperating individuals. As a general association of the numerous American societies for the advancement of the special sciences, it consisted of 152 autonomous and independent associated scientific societies, of which 109 were officially affiliated with the association, 29 being local academies of science. Its various sections represented the main current subdivisions of science: Mathematics, physics, chemistry, astronomy, geology and geography, zoological sciences, botanical sciences, anthropology, psychology, social and economic sciences, historical and philological sciences, engineering, medical sciences, agriculture, and education.

The association holds two meetings during the year, one in the summer and the regular annual meeting in December. By invitation of the University of Minnesota, the last summer meeting was held in Minneapolis, Minn., June 24 to 29, 1935, with an attendance of about 1100. This meeting was the ninety-sixth meeting. The next meeting, the ninety-seventh, was held in St. Louis, Mo., Dec. 30, 1935, to Jan. 4, 1936, by invitation of the Washington University, the St. Louis University, and the Academy of Science of St. Louis. The registered attendance was about 2300. Some 40 affiliated and associated organizations met with the association in connection with the St. Louis meeting.

Of the 1200 papers presented at the section meetings, the prize of \$1000 for one describing a noteworthy contribution to science was awarded to Dr. P. W. Zimmerman and Dr. A. E. Hitchcock of the Boyce Thompson Institute for Plant Research, for "Responses of Plants to Synthetic Growth Substances (Phyto-Hormones)."

The official organ of the association is a weekly journal, *Science*. In addition it issues the *Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science. The permanent endowment of the association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1935, to about \$206,000.

The president of the association for 1935 was Karl T. Compton, president of Massachusetts Institute of Technology. The president-elect for 1936 was E. G. Conklin, Princeton University. The other officers were Permanent secretary, Henry B. Ward; general secretary, Otis W. Caldwell; and treasurer, John L. Wirt. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

ADVENTISTS. In America the Advent Movement owed its origin to William Miller (1782-

1849), who from 1831 taught not only that Christ was coming in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. For the early history of the Advent Movement see THE NEW INTERNATIONAL ENCYCLOPEDIA, vol. i, p. 158 ff.

Advent Christian Church. This Church holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. Headquarters of the general conference are at 160 Warren Street, Boston, Mass.

Seventh-Day Adventists. This denomination, which is the largest of the Adventist group, embraces nine union conferences in the United States and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism.

On the basis of Biblical prophecy, including the prophecy of Christ himself, it teaches the imminence of Christ's second coming, and the end of this present world. The statistical report of the denomination for 1934 indicated 2375 churches in the North American division, 1026 ordained ministers, and 151,216 church members; Sabbath schools, which numbered 2922, had a membership of 146,179.

The foreign divisions, including the Australasian, Central European, Chinese, Far Eastern, Inter-American, Northern European, Southern African, South American, Southern Asia, Southern European, and Union of Soviet Socialist Republics divisions, consisted of 5543 churches, 1272 ordained ministers, 253,293 church members, and 9045 Sabbath schools with an enrollment of 344,888. Throughout the world there was an increase in membership of 20,358 over 1933. The work was conducted in 325 countries and islands by 70 union conferences, 144 local conferences, and 318 mission field organizations, employing 23,753 evangelistic and institutional laborers.

The denomination maintains in the United States and Canada 109 educational institutions, which in 1934 had an enrollment of 15,536 students. There also are maintained in foreign countries 105 educational institutions with an enrollment of 9641 students. The denomination has 17 publishing houses in North America and 52 in other countries. The principal periodicals are the *Advent Review and Sabbath Herald* and *Signs of the Times*. Total contributions from all sources in 1934 amounted to \$6,242,556.35 for the North American division, and \$3,650,658.32 for the other divisions. The headquarters of the general conference are at Takoma Park, Washington, D. C.

ÆGEAN ISLANDS, ITALIAN. The Ægean islands of Rhodes (Rodi), Castelrosso, and the Dodecanese group (12 islands). Total area, 977 sq miles, population (1933), 134,384 compared with 131,255 (1931). The 1931 population was 83 per cent Greek, 7 per cent Turkish, 5 per cent Italian, and 5 per cent Jewish. Chief towns: Rhodes (Rodi), the capital, 25,447 inhabitants; Kalymnos (Calmo), 16,512; Cos (Coo), 11,571; Symi (Simi), 9462.

Production and Trade. Grapes, olives, tobacco, oranges, and vegetables were the main agricultural products. The important industries were the manufacture of wine, olive oil, artistic pottery, tiles, and oriental rugs. Sponge fishing was an important occupation. In 1933, imports were valued at 48,000,000 lire, exports, 15,000,000 lire (lira averaged \$0.0667 for 1933).

Government. For 1933-34 the budget of 68,000,000 lire included a state contribution of 3,000,000 lire. A governor, who was under the Italian Foreign Office in Rome, headed the administration. Governor in 1935, Senator Mario Lago.

History. Because of their strategic importance as a base for Italian expansion in Asia Minor, the Turks considered Italian occupation and fortification of the islands as a perpetual menace to their security. With the development of the Anglo-Italian crisis in 1935 and the entrance of the British fleet into the Mediterranean, the Turkish government early in October offered the British the aid of their fleet and the use of Turkish ports in case of war. In return they asked that the six fortified islands in the Dodecanese group nearest the Turkish shore be restored to Turkey. It was understood that, if Italy was defeated, the remainder would go to Greece. The Italians during 1935 displayed great activity in the islands, strengthening their fortifications, increasing their armed forces, improving the naval base at Leros, and storing war supplies on Rhodes. Extensive hospital facilities were erected on Rhodes and many of those wounded or stricken with disease during the campaign in Ethiopia (qv) were taken there. See GREAT BRITAIN, GREECE, ITALY, and TURKEY under *History*.

AËRONAUTICS. Of the noteworthy aeronautical events of 1935, a considerable majority took place on the ground. Dramatic adventure was not lacking from the record, but memorable flights have a relatively small place in it. The major place is reserved for the record of government policy, of progress in design, and of fruition of plans long worked on in secret for the opening of new air routes.

For various reasons, the most important deriving from the prevalence of war clouds over Europe, the aviation boom that had been so catastrophically terminated in 1929 was reborn. Unemployment among skilled aircraft workers was unknown. Engineering schools, fortunate if they could find aeronautical employment for a quarter of their aeronautical graduates three years ago, found themselves unable to meet the demand for technically-trained men. The stocks of aviation companies took place among the leaders, both in volume of transactions and in rapidity of rise of price, of a speculative boom on both the New York and the London exchanges. The total production of aircraft and engines for the year probably exceeded that of any other peace-time year except 1929, and the indications at the end of 1935 were plain that 1936 would easily surpass the 1929 record.

Air Transport. The cancellation of the air mail contracts, in February, 1934, still casts a shadow over American domestic transport operations. The atmosphere of instability that the cancellation left was to have been abated by the report of the Federal Aviation Commission, created by law for the definition of a general air policy for the Federal government, and the anticipated acceptance and execution of its recommendations. It proved rather to be enhanced, when the Commission's extensive review of the problem and its one hundred-odd recommendations for dealing with it were casually and almost contemptuously dismissed by the President and the Congress. In the President's case the dismissal took the form of a special message serving warning on the operators of air transport that so long as they were

receiving assistance from the government "any profits at all by such companies should be a secondary consideration."

The Commission, conducting approximately the twenty-fifth investigation of American aviation since the war, had concluded that air transport should have governmental recognition as a department of commerce by no means limited in significance to its rapid carriage of the mails, and that it should be emancipated from an exclusive Post-office control and put under the dominion of some agency of less habitually partisan administration and with a broader point of view. Though the Post Office Department naturally opposed that recommendation, and though the concealment of a direct financial grant in aid of transport operation under the guise of a "mail contract" continues to be a feature of American air policy as of merchant marine policy, the year nevertheless brought a certain attenuation of postal control over air transport. The Interstate Commerce Commission was definitely given the power either to raise or to lower established rates of payment under existing mail contracts. The same legislation, the Mead-McKellar Air Mail Act, required that the Commission maintain a minute watch over the air lines' operations, with special reference to expenditures that might be considered unnecessary or extravagant, and subjected the further extension of the air transport map and the development of any new inter-line competition to a Commission veto. Henceforth, new services can be initiated only with ICC approval. The Post Office Department has challenged the interpretation of the law upon almost every occasion of attempted use by the Commission of its newly-acquired powers, but so far unsuccessfully.

Increased Traffic. Despite all these confusions, which might well have been disastrous if they had been encountered three years earlier, air transport's progress has been steady and its operating record has continued to improve. Political turmoil intervened just as travel by air was beginning to gain wide public acceptance, and failed to check its growing popularity. During the summer of 1935 the number of daily air schedules between New York and Chicago reached 19 in each direction. The total number of passengers carried on the domestic air lines during the year increased about 65 per cent over any previous year, to a total of 746,946, while the total service in terms of passenger-miles rose by about the same fraction, to a little under 300,000,000 passenger miles per year. The total traffic including the foreign lines under American registry was nearly 350,000,000 passenger miles (exact and final figures on the year's traffic not being available at the time of writing). Express business increased in even larger proportion than that with passengers, but remains comparatively insignificant in magnitude, the contributions of passengers and express to air-line revenue being approximately in the ratio of 20 to 1. Prospects for further increase in express volume were bright, as the result of the final formation of a truly national air express system in place of the two incomplete and imperfectly cooperating systems heretofore available. By the end of the year all of the domestic air lines except Transcontinental and Western Air had ratified an operating agreement under the leadership of the Railway Express Agency.

Passenger traffic was highly seasonal, as usual, air travel in summer still being both pleasanter

and more certain of on-time arrival than during the storms of winter. In August the total domestic traffic rose to over 35,000,000 passenger-miles, the mail movement to 750,000,000 pound-miles, the latter exceeding by 25 per cent the record figure for any month previous to 1935. European lines also showed general improvement in traffic over previous years. Imperial Airways, for example, was up about 30 per cent, but the year's total for all British lines still fell below the best single month for the American lines, and the total of American traffic for the year remained substantially equal to the total for the rest of the world.

Air-Line Coordination. In the field of policy the formation of a unified express service was a particular example of a generally increasing willingness to cooperate. Near the end of the year the American air transport lines unanimously withdrew from the Aeronautical Chamber of Commerce, and formed a new trade association of their own. The first act of the new association was the establishment of an all-inclusive scrip plan, whereunder mileage books sold by any line became interchangeably usable for travel on all other lines. A still more spectacular announcement, a bit later, related to a common development programme with a number of the leading transport operators pooling their efforts to sponsor the design of new large aeroplanes that would be suitable for all of them to use.

The material of domestic air travel and its operating methods underwent no very important changes. The domination of the nation's air routes by twin-engined low-wing all metal monoplanes bearing the names of Douglas, Boeing, and Lockheed became progressively more complete, and at the end of the year the most recent models of those three manufacturers accounted for more than 80 per cent of all transport operation. The first example of a new and somewhat enlarged Douglas with special provision for sleeper service was completed in December, and plans were being made for a general replacement of twin-engined by four-engined aeroplanes at some time during 1937 or 1938.

Methods of operation and navigation were refined in detail but showed no fundamental alteration during the year. During the autumn and winter, attention began to be concentrated on collision hazard in the neighborhood of the largest cities where the arrival of transport planes at intervals of 5 or 10 minutes created a bad-weather traffic problem of serious dimensions. Ordinary private owners had to be forbidden to use the air routes in bad weather as a first step towards eliminating the danger, and a traffic controller was established at Newark Airport (New York's air terminal) to keep track of the exact position of all nearby aircraft, and to instruct them by radio in manoeuvring to keep well away from each other.

Air Transport Safety. The safety record on the transport lines was beyond all precedent, with a total of fifteen passenger fatalities, or more than 20,000,000 passenger-miles for each one. The fact that one of the two major accidents of the year included Senator Bronson Cutting (q.v.) among its victims, however, was responsible for starting still another of the long series of aviation investigations. Under the chairmanship of Senator Cope-land, the investigating committee spent six months collecting data, planned to hold open sessions early in 1936 on the general subject of what derelictions might have entered into transport operation and

what government policies might serve to make it safer.

European lines, on the other hand, had a very bad year. Imperial Airways, with an admirable safety record of long standing (though never quite equal to that established on the American routes over the last five years), was particularly unfortunate in losing a number of aeroplanes, some of them with loss of life. The most spectacular of European crashes, however, was non-transport. It was the outcome of a stunting display by a young Russian pilot who finally dove into a collision with the *Maxim Gorki*, world's largest aeroplane (210-ft. wing span, 100,000 lb. weight). Its 49 occupants lost their lives.

Trans-Oceanic Air Service. The most important transport developments of the year, as well as the most dramatic, were outside the United States. They were on the high-seas air routes. Pursuant to plans first organized in 1931, Pan American Airways sent a supply ship out into the Pacific to establish bases on the hitherto completely deserted reef of Wake and the almost equally unfamiliar one at Midway, as well as at better-known and well-populated Guam. The *North Haven* at home again, after having boated through the surf at those remote atolls the components of a cargo that included everything from a complete Diesel-engine-operated electric-light plant for each base to a ping-pong table for the relaxation of the personnel, flying boats began to feel a cautious way out along the line of milestones just planted. A succession of flights extending gradually farther from the California coast paved the way for the letting of a contract for trans-Pacific air mail by the Post Office Department in the late summer, and for the actual opening of mail service between California and the Philippines in mid-November. Passenger service over the same route waits only upon the completion of hotels for overnight accommodation upon a reef that a year before had been recorded on charts only to warn navigators away from its inhospitably breaker-lashed bounds.

On the western terminus of the Pacific route, half a dozen nations narrowed their convergent gaze. Japan manoeuvred to prevent Caucasian domination of far-Eastern routes. British Imperial Airways, Dutch Koninklijke Luchtvaart Maatschappij, better known to travelers as KLM, and Parisian Air France all schemed over possible routes that would rationally extend their present Asiatic services to connect with Pan American's trans-Pacific. Pan American itself planned for projection across the Sea of China to Portuguese Macao, to connect there with the European lines.

Pan American laid plans also for another approach to the Orient, by way of Australasia. Islands offering re-fueling base possibilities to the south-west of Hawaii were surveyed, and on November 23d an agreement giving Pan American the privilege of entry into New Zealand was signed. Direct service between the United States and New Zealand was promised within the next 18 months.

The aircraft used across the Pacific are monoplane flying boats, each with four engines. Generically known as Clippers, they are the product of the Martin factory in Baltimore. With a loaded weight of over 50,000 lb. and with an almost unprecedentedly high ratio of useful load to total weight, they exceed in size any aeroplanes of any type previously built in the United States. With a normal cruising speed of better than 160 miles per hour, although they throttle back to considerably less than that over very long distances, they

are designed to accommodate a ton or more of mail and a number of passengers on flights up to 2500 miles in length. Sikorsky Clippers of 20 per cent less gross weight, and shorter maximum range, had a share in pioneering the Pacific run before the Martins became available.

While the foresight of American voyagers and Naval officers who planted the American flag a generation or two ago on various of these scattered eruptions of coral rock in mid-Pacific permitted Pan American to reach the Philippines without making a stop elsewhere than on American soil, European governments and transport companies continued their rivalry on other oceans and along routes that carried them through the territories of many nations. The Dutch service to the East Indies, with its terminus in Sumatra, was stepped up to a twice-weekly departure from Holland during the summer. The French improved the organization of their regular line to Indo-China, and Imperial Airways, in addition to reducing the maintenance of the Anglo-Australian service to routine, inaugurated in November an experimental and intermittent line from Penang, near Singapore, to Hong Kong. On the South Atlantic the Germans continued to maintain a weekly operation by flying boats with a progressively diminishing dependence on mid-ocean refuelling from mother ships, and the Graf Zeppelin maintained the undisturbed regularity of its own trips between Friedrichshafen and Brazil. The Zeppelin service proved so popular with passengers as to be consistently sold out a number of weeks in advance. The French progressed towards complete emancipation from the torpedo boats that had for a number of years been carrying the air mail between West Africa and the easternmost projection of Brazil. Thirty-one crossings of the south Atlantic were made by French transport aircraft up to November 1st, and the record time of transmission of the mail between Paris and Buenos Aires was set in June at 66 hours 29 minutes.

On the north Atlantic political problems continued more serious than technical ones. Though an all-British service between Canada and Ireland is theoretically possible during the summer months, it would almost inevitably be seasonal in nature. For year-round operation with aeroplanes of present capacity it seems inevitable that the Azores be available as a stopping place, and it is of course commercially essential that such service have a direct entry to the United States. International agreement is then a prior condition of trans-Atlantic transport. It has been very slow in arriving, but during November, which was also the month of the opening of the trans-Pacific service and perhaps the most significant month in the entire history of world air transport up to this time, a British Empire delegation reached Washington to seek agreement on trans-Atlantic conditions. Agreement in general terms was attained, and the inauguration of a service which will make air transport literally world-wide and will allow the ordinary traveler to circumnavigate by purely commercial services in no more than 14 days seems now to wait only upon the completion of British aircraft technically qualified to do in the Atlantic what Pan American's Clippers would already be prepared to undertake. Another three years at most ought to see the launching of 36-hour service between New York and London.

While Pan American made progress across both oceans, it ran into trouble nearer home. Developing nationalism in Mexico produced an edict that

Mexican pilots must henceforth be used between Mexico City and Los Angeles. At first indignantly opposed by the air line, even in the face of a threatened withdrawal of the right to operate, it was finally accepted as affecting one of the two occupants of each cockpit.

New Aéroplane Designs. The oceans have been the domain of the giant flying boat. Both in the United States and Great Britain present plans extend up to the construction of machines of 100,000 lb. gross weight or more, while the French have actually shown the way into a region well beyond Pan American Clipper dimensions by building the *Lieut.-de-vaisseau Paris*, with six engines, a wing span of 160 feet, and a weight of 83,000 lb. That craft first flew in January, crossed the Atlantic in December, and was unfortunately wrecked by storm while at anchor in Pensacola harbor in January, 1936. In the manner characteristic of European flying boats, its speed was considerably below prevailing American standards. It cruised at 133 m.p.h.

Transport land planes also tend toward increased size. For several years the maximum on American routes has been about a 16-passenger capacity, while Imperial Airways was running 40-passenger Handley Page biplanes across the English Channel. Forty-passenger capacity seems likely to be a rather general rule on all routes with enough traffic to permit it within the next two or three years. Orders have been placed by both British and French air lines for new types of that size or even larger for overland use, while experimental work of the same order has gone forward in America.

At the same time there has been a substantial development of smaller transport equipment. Several American manufacturers have produced new high-speed machines with twin engines and carrying from 6 to 8 passengers, for use on feeder lines of light traffic, so invading a field of design that had been almost exclusively British. Most noteworthy European trend of the year among smaller transports has been a quest for speeds approaching those so eloquently displayed to European operators and manufacturers by the American machines imported for use on Swiss Air and other European lines and by those that flew in the MacRobertson race to Australia in the previous year. The Douglas Company alone had more than 20 of its aeroplanes in service on European air lines by the end of 1935, and a number of European manufacturers had produced models strongly suggestive of the Douglas in appearance,—the product of a state of mind lightly described as "Douglas-terria" that followed the Douglas accomplishment of flying a regular passenger-loaded transport into second place, immediately behind a specially-built two-passenger racing machine, in the MacRobertson contest. Three British firms brought out during 1935 transports of their own design carrying from 10 to 14 passengers at 190 miles per hour or better, while some of the new French products reported speeds well above 200. The disposition to higher speed showed itself also in still smaller aircraft of British manufacture. As American builders invaded the six-seater field which had always been a British specialty, so England encroached on what was hitherto a virtual American monopoly in four-seaters suitable for private use. Striking British aeroplanes of the year included the Miles Falcon, which used only 200 h.p. to carry four passengers at a speed of 180 miles an hour or higher and which captured the King's Cup, the clas-

sic of British air racing. It was in a Percival Gull, a three-passenger machine of almost equally high speed, that Miss Jean Batten, a New Zealand girl already well known for long distance flights, made the first solo crossing of the south Atlantic by a woman. Accomplished near the end of the year, her flight took her from England to Brazil in 61 hours and 15 minutes, including a crossing from Africa to South America in the record time of 13 hours and 15 minutes.

Most remarkable concept of the year, however, was the composite aeroplane designed by Mr. R. H. Mayo and built by Short Brothers in England for Imperial Airways. It was a combination of two aeroplanes in one, with the purpose of using the larger of the two merely as a device to aid the smaller and faster in getting into the air with a great load of fuel. The two would be clamped together, with the smaller machine held above the wing of the larger one, until the combined thrust of their combined power plants raised them from the water, and the smaller unit would then be uncoupled to proceed to its remote destination. Despite the eminence of its sponsorship, the scheme appeared to most engineers as of questionable practicability, and as at best a somewhat uncertain and extremely expensive substitute for a catapulting device to assist in launching.

Turning from individual designs to general trends, the monoplane continued and even extended its ascendancy. Even in England, where the biplane has found its staunchest advocates, a majority of the new aircraft of the year, both of the military and commercial groups, were monoplanes. All-metal construction, with most of the strength in the aluminum-alloy skin of wings and body, made further progress towards becoming a world standard.

Private-Owner Aeroplanes. Aside from the Clippers already mentioned, and certain military aeroplanes, the year's most notable innovations in the United States were certain small machines built under the sponsorship and at the cost of the Department of Commerce, with the announced intention of stimulating private flying by making it at once cheaper and easier. The first new machines that were produced under the Department of Commerce's programme failed to arouse any great enthusiasm, but germinated a violent controversy over the propriety of the Government's incursion into the direct stimulation of new commercial designs and over the degree of intelligence with which the actual efforts along that line were being directed. Mr. Vidal, Director of Air Commerce, aspired to expand the market for the aircraft industry's products out of all semblance to its present magnitude, but the industry as a whole remained persistently skeptical of the value of his help. There was general agreement that one beneficial result had been forthcoming in the concentration of attention upon a new type of landing gear, with a small wheel forward and the two principal wheels aft of the centre of the body, in substitution for the reverse arrangement that has long been standard. The new type of landing gear, dubbed "tricycle," appeared on all the Department of Commerce's private ownership types, and there was wide agreement that it made landing of an aeroplane much easier for the inexperienced, and greatly diminished the amount of skill required in judging the approach to the ground. More skeptically received were attempts to convert automobile engines for aircraft service and an effort to produce an aircraft capable of folding its wings and being

driven along the highway as an automobile after landing. The tricycle landing gear was attracting attention in Europe as well as in the United States, the French Nieuport firm having incorporated it in a three-passenger plane produced during the year.

Despite all efforts of the Department of Commerce, the total volume of private ownership and of production of aircraft for private sale showed but little change during the year. At the end of 1935 there was a total of 9072 non-military aeroplanes in the United States, a substantially lower figure than existed at the end of 1930. The number of pilots was also well down from five years ago, to just under 15,000. The production for the year was a little over 1000 aeroplanes of non-military types, about a third of the total number being two-passenger light planes with engines of less than 60 h.p. Production of the more expensive private ownership types, selling at from \$4000 to \$10,000, remained substantially on the 1932-34 level. The year's most encouraging sign was a great increase in the number of applications for student permits by prospective pilots. The total number of such permits to learn to fly outstanding at the end of the year was just over 25,000.

The most novel of private-ownership developments came from France, where the publication by Henri Mignet of a book on *How to Build the Flying Flea (Pou de Ciel)* led some hundreds of amateur enthusiasts to start the construction of tiny tandem monoplanes, of small manoeuvrability and less performance but reputed to be very easy for the novice to fly, powered with motorcycle engines. Like previous home-building booms on a smaller and less-well-publicized scale, the Pou-de-Ciel excitement was responsible for the partial construction and abandonment of a large number of machines, and for the completion of a number that did little or no flying. One of the Flying Fleas did, however, succeed in crossing the English Channel during the summer. Robert Kronfeld, famous glider pilot, paralleled its accomplishment by flying from London to Paris on a 13 h.p. aeroplane of German origin.

America's most non-stopping private pilot, Dr J. D. Brock of Kansas City, brought his unbroken string of daily flights up to over 2000 during the year,—more than five years without missing a day in the air.

Technical Developments. Important items of the year's technical evolution were the introduction of the automatic propeller, the position of its blades adjusted through its governor to maintain a constant engine speed under all conditions of flight; the automatic mixture control for the engine, relieving the pilot of one of the most difficult of his manual power-plant adjustments; an increasing use of spot welding in place of riveting for assembling aluminum-alloy structures; and the transport lines' general acceptance of cruising control, with the conditions of engine operation and the altitude at which to fly carefully determined from time to time during each trip to best combine maximum economy of operation with the closest possible adherence to schedule (a technique developed and refined by Edmund T. Allen, American leader in the profession of test-pilot engineering).

The year was one of steady refinement, but of no important change of direction, in power-plant evolution. Diesel engines gained ground to the extent that their ultimate use on long-range aircraft was generally accepted as probable, but they

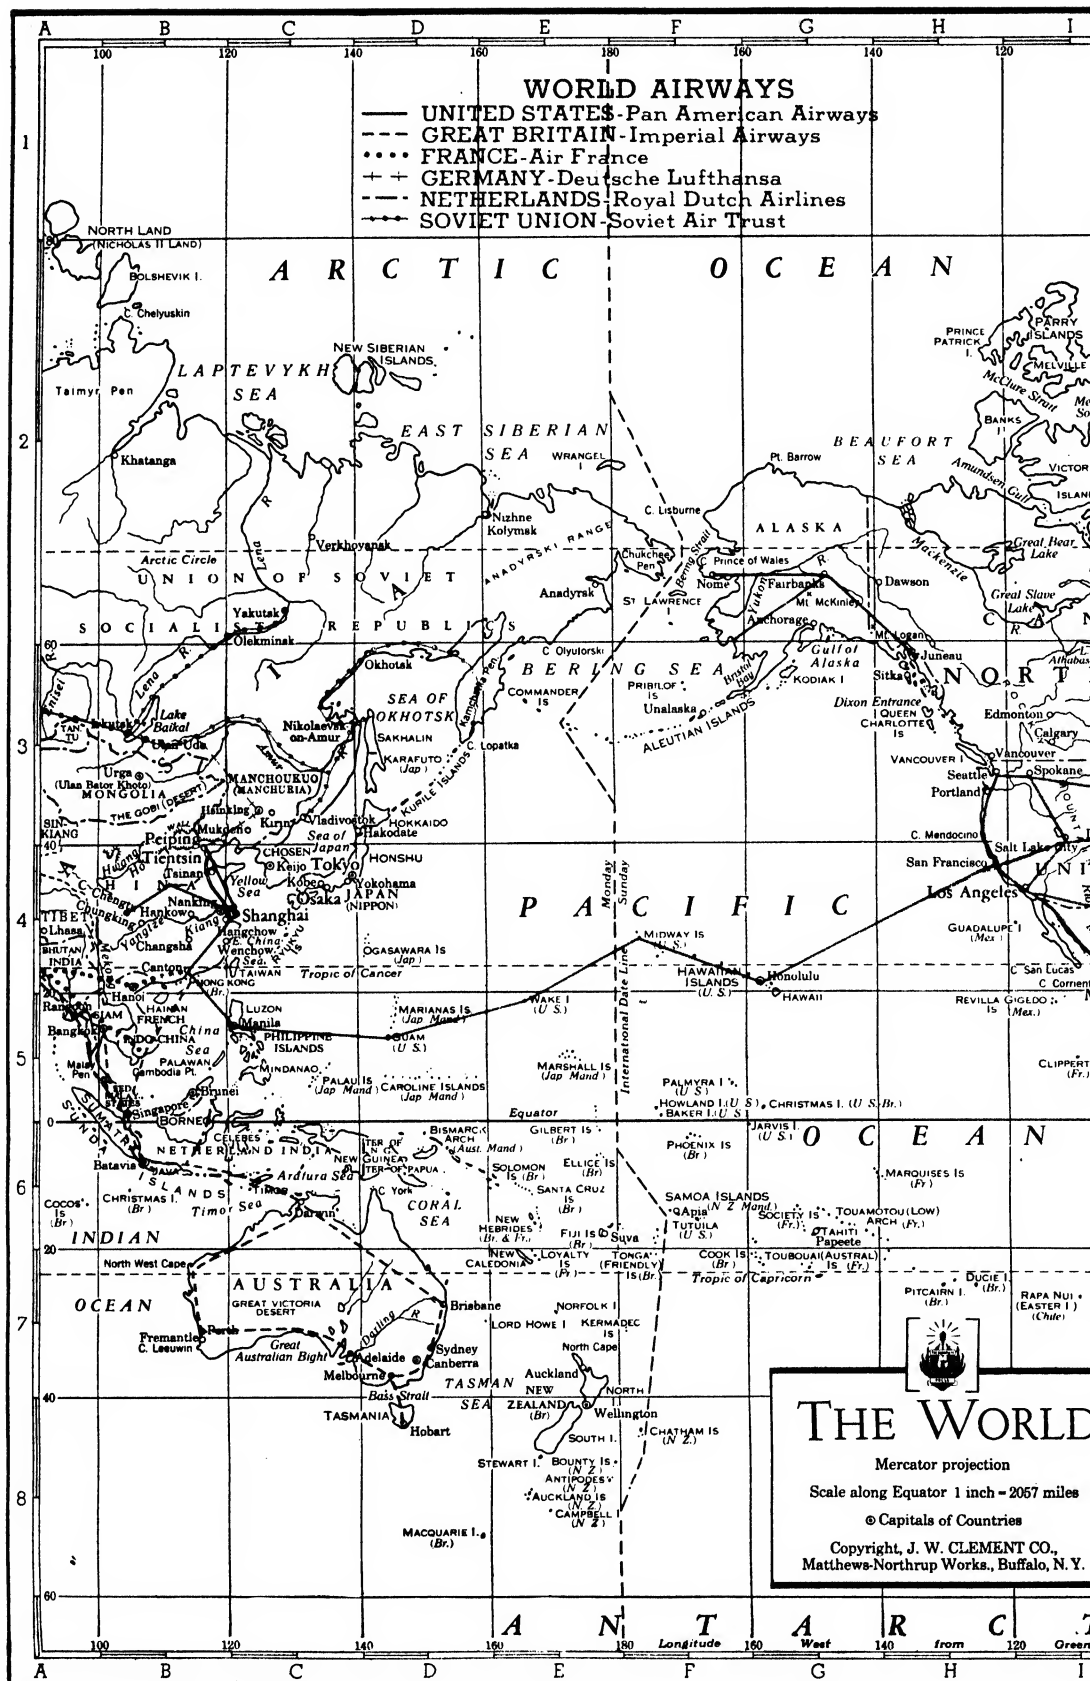

remained highly experimental. The balance between water-cooled and air-cooled engines was substantially undisturbed, with a slight revival of interest in the former in the United States, and a continuing use of liquid-cooled engines on most European military aircraft of very high performance and of American-made air-cooled engines on a very large proportion of the European non-military aircraft on which commercial economy and reliability were paramount.

Flights of the Year. As already observed, notable flights were comparatively few. There were several Atlantic crossings, perhaps the most interesting being a somewhat leisurely trip from New York to Norway made during the summer by Thor Solberg and Paul Oscanyan in a small commercial flying boat of several years' age. Jean Batten's crossing of the south Atlantic has already been mentioned. Amelia Earhart continued to make news, first with a solo flight from Honolulu to San Francisco in 18 hours 15 minutes (in mid-January), second with a non-stop trip from Mexico City to New York in 14 hours 19 minutes in May. Laura Ingalls crossed from New York to Los Angeles without stop in July, the first non-stop west-bound trip by a woman, and on September 12th returned across the continent in 13 hours 34 minutes for a new feminine record. The male transcontinental record with transport aeroplanes was several times broken during the early spring, finally being set at 11 hours 6 minutes by D. W. Tomlinson with a Douglas plane.

A few days later the same pilot and machine made a number of new speed records over long closed courses, the most striking being a speed of 191 miles per hour over a distance of 2000 km (1242 miles), and carrying a load of 2000 kg (4400 lb). Several of the Tomlinson records were recaptured for Europe later in the year by an Italian machine. An Italian flying boat traveled 3080 miles without stop, for a new seaplane distance record that stood only six months before. Lieut. Commander K. McGinnis piloted a Navy Consolidated flying boat, remarkable for folding its auxiliary lateral floats up into the wings and so eliminating their air resistance when once off the water, from Panama to San Francisco without pause (a distance of 3443 miles). The Navy sent a squadron of patrol flying boats to cruise in the Aleutian Islands during the summer in accordance with a new determination to get operating experience in areas of persistent bad weather, it sent another group of squadrons of some 40 machines on a mysterious mission during the summer manoeuvres in the Pacific that carried them out through the Hawaiian group as far as Midway, where Pan American was just then preparing for regular commercial service.

Late in the autumn, David Llewellyn and Mrs. Jill Wyndham, in a British light plane, lowered the Cape Town-London record (approximately 7500 miles, by the route taken) to 6 days 8 hours 27 minutes.

Among the long-distance fliers, the year was one of tragedy. On August 16, Wiley Post (q.v.), twice breaker and still the holder of the round-the-world record, was killed in a crash near Point Barrow, Alaska. With him died Will Rogers. In December, hope was finally abandoned for Sir Charles Kingsford-Smith (q.v.) who had disappeared a month before while flying across the Sea of Timor en route to Australia. First to cross the Pacific by air and holder of records innumerable, Sir Charles lost his life in the very month in which

the regular trans-Pacific air service for which he had shown the way seven years before was becoming a reality.

Records and Races. Among the straight record performances involving no long distance flying, the most interesting of the year was Howard Hughes' new landplane speed record of 352 miles per hour, almost 40 miles per hour above the previous mark, though still nearly 100 miles per hour below the seaplane record, a discrepancy due partly to the greater interest shown in seaplane racing over a number of years and to the enormous sums expended by governments in sponsoring it, and partly to the feasibility of landing a seaplane at higher speeds than would be safe on any landing field. Mr. Hughes' speed, incidentally, was the highest ever made with either landplane or seaplane with an air-cooled engine.

The quest for a duration record with refueling in flight, for several years dormant, was resumed during the summer when Fred and Al Key, of Mississippi, kept an aeroplane with a Wright Whirlwind engine continuously in flight for 27 days 5 hours 34 minutes.

Late in the autumn there came a report, not yet subjected to official verification, that a Russian pilot named Vladimir Kokinaki had climbed to a height of 47,800 feet, about 400 feet above the existing world's altitude record.

In the National Air Races at Cleveland the principal competitive events were colorless except for a sensationally close competition in the race from Los Angeles to Cleveland, won by Ben O Howard, a transport line pilot flying a four-passenger cabin machine of his own design and construction, in 8 hours 33 minutes 16 seconds. Roscoe Turner reached Cleveland only 23 seconds behind Howard. The same aeroplane won the principal closed-circuit speed race, for the Thompson Trophy, at an average of 220 miles per hour, the lowest winning speed in several years.

The fastest of European closed-course events, the Deutsch Cup race for machines with engines of not over 490 cu. in. piston displacement, was won by Delmotte, in a Caudron monoplane, at an average speed of 276 miles an hour.

Soaring Flight. The national soaring contests at Elmira were better organized and aroused more popular interest than ever before. The soaring camp and its accompanying meteorological station have become firmly established as a permanent feature, but the 1935 contests failed to present any remarkable records. The longest flight was Richard DuPont's, 120 miles; the highest altitude, also DuPont's, 4980 ft. The soaring flight of the year came (as usual) from Germany, where Rudolf Oeltzschner traveled the air-currents for 313 miles across country.

Autogiros and Helicopters. The year was comparatively lacking in news of rotating-wing aircraft progress. Work continued on wingless, or direct-control, autogiros, and the U.S. Army bought its first autogiro. No attempt was made to stimulate a commercial market until there should have been further trial and refinement of the new type.

The most interesting of the year's helicopter events was the announcement that Louis Breguet, leading French aeroplane builder, who dabbled in helicopters 30 years ago and built one of the first direct-lift aircraft to raise itself from the ground, had returned to his first love. Of the performance of the new Breguet helicopter, little is known except that it has made flights to a height sufficient

to escape the immediate effects of the direct reaction of air compressed between the horizontally-rotating propellers and the ground, so that it could be regarded as truly and normally air-borne.

Balloon to the Stratosphere. The ballooning event of 1935 was the final success of the stratospheric campaign jointly sponsored by the Army Air Corps and the National Geographic Society. The explosion of the summer of 1934, at a height of several miles, was followed by a bursting of the balloon during the process of inflation early in July, 1935. Repaired and re-inflated, it went through its next trial without a hitch, carrying Capt. Orvil A. Anderson and Capt. A. W. Stevens to a height of 72,395 ft., far above any previous record, on November 11. The flight was started from Rapid City, North Dakota.

Airships. American rigid airships, on the other hand, met with what looked as though it might very possibly be final failure. The *Macon* followed the *Akron* to destruction on February 12. The *Macon* went down as a result of structural failure in a comparatively gentle storm off the California coast, and extensive investigation left the accident still without any satisfactory explanation. Fortunately, only two lives were lost. The government's future policy on airships was still under consideration at the end of the year, but with little indication that the Navy Department would ask or that Congress would supply the funds for more construction.

Long-continued trouble-free operation of rigid lighter-than-air craft remained a German monopoly. The *Graf Zeppelin* voyaged back and forth across the South Atlantic, and the new *L.Z. 129*, larger than the *Graf* and Diesel-engined, neared readiness for entry into service between Germany and the United States.

Military Expansion. Military aviation the world over was dominated by, and was dominant in, re-armament programmes. American appropriations for new aircraft for the Army and Navy were carried to a point 60 per cent above the previous post-war high,—to over \$50,000,000 for the year. A virtual doubling of American air forces was planned for the next five years. European nations thought in terms of much more hurried action. During the spring, Germany formally admitted a self-emancipation from the restrictions of Versailles which had long been *de facto* apparent. Though no formal announcement of the strength of the German air force or of the rate at which it was being increased was forthcoming, a tremendous acceleration of activity was evident to the most casual observer, and sober and competent estimates put the German rate of construction of new military aeroplanes as high as one hundred a week. It was evident that if Germany did not actually have the most powerful air force in the world by the end of 1935 she very soon would, barring counteracting measures elsewhere.

Counteracting measures were, of course, taken. Though a veil of secrecy of an impenetrability unprecedented in peace-time hovered around all military air matters, no doubt was left of the intention of all the major European states and most of the minor ones that their present air forces should be taken merely as a foundation on which to build to towering heights. Extraordinary appropriations for re-armament, quite outside the regular budgets, were the order of the day, and no factory capable of building military aircraft wanted for work to keep it running overtime.

American Air Forces. Within the American Services, the most important development was the formal organization of the General Headquarters Air Force on the lines that had been recommended by the board of which Newton D. Baker was the chairman. A mobile force operating independently of ground troops, it includes all available fighting and bombing planes except those used for training and for the local defense of such overseas areas as the Canal Zone and Hawaii. Divided into three "wings" normally based on the Atlantic, Pacific, and Gulf coasts, respectively, the entire force can be united in any threatened sector in a few days' time. Colonel Frank M. Andrews was appointed to command it, and was given the brevet rank of Major-General as an index of the new unit's importance.

The Washington command of the Air Corps changed hands. Maj.-Gen. Benjamin D. Foulois, the Army's first pilot (trained in 1908), retired from office and from the Army at his own request. Shortly before submitting it, he had been formally and fully exonerated by the Secretary of War under a series of charges of extra-legal tactics in aircraft procurement that had been filed by the House of Representatives Committee on Military Affairs. Maj.-Gen. Oscar Westover succeeded General Foulois as Chief of Air Corps, an office of which the responsibilities had been re-defined and especially focused upon the procurement of *matériel* as a consequence of the G.H.Q. Air Force's creation to control operations in the field.

In *matériel* matters it was a period of legal tangle gradually progressing towards solution. The War Department became so involved in its attempts to interpret the law in a fashion that would satisfy Congressional committees, and retraced its steps so often, that for a period of almost one year not one single production aeroplane was delivered to the Air Corps. By the end of the year, however, a reasonably coherent policy seemed to have been evolved, and aeroplanes were being ordered in quantity, for deliveries in the latter part of 1936 and early 1937. The Navy's affairs went more smoothly, as has usually been the case in aeronautical matters.

A number of competitions for new military types were held. The most interesting aeroplane that they produced was the four-engined Boeing bomber, a machine of 30,000 lb. weight (considerably larger than any bomber heretofore used by the Air Corps) and exceptionally clean lines and high performance. Though destroyed during the competition, through no fault of the aeroplane's own, its trials had gone far enough to make the Army order thirteen examples, at approximately \$300,000 each. The major bomber order of the year went, as a result of the same competition, to Douglas,—for a considerably smaller and less costly machine.

AFGHANISTAN, äf-gän'i-stan'; -stän'. A monarchy of central Asia, bounded by the Soviet Union, India, and Iran. The area is estimated at about 245,000 square miles and the population at 11,000,000. Kabul, the capital, has about 80,000 inhabitants; Kandahar, 60,000 (with suburbs); Herat, 30,000; and Mazar-i-Sharif, 20,000. Persian and Pashto are the principle languages. The people are illiterate for the most part, although primitive elementary schools exist throughout the country. Several secondary schools with European instructors have been established, as well as a university at Kabul and technical, art, commercial, and medical schools.

Production, etc. Fruits, vegetables, and cereals are grown in the irrigated plains and valleys, and castor-oil, madder, and asafetida plants abound. The native fat-tailed sheep is the chief source of meat, of grease used as a substitute for butter, and of skins and wool cloth for wearing apparel. Coal, copper, iron, lapis lazuli, silver, petroleum, and some gold deposits are found but lack of transportation facilities prevent their exploitation. Kabul contains state-owned factories for the manufacture of matches, buttons, leather, and boots; a factory for making arms, ammunition, and clothing for the army; and a mint. Silk, woolen, and hair cloths and carpets are widely manufactured by handcraft.

The chief imports are cotton goods, dyes, sugar, hardware, leather, silver articles, and tea. Raw wool, fruits, timber, carpets, and skins are the main exports. Trade is principally with India, Iran, and the Soviet Union. The chief routes to India are from Kabul to Peshawar by way of the Khyber Pass and from Kandahar to the railway terminal at Chaman in Baluchistan. Goods are transported mainly by camels and pack-horses although some roads are passable by motor cars in dry weather. There are telephone systems in the chief towns, telegraph communication linking Kabul and Kandahar with Peshawar and Chaman, and a wireless station in Kabul communicating with India and Eastern Europe.

Government. Afghanistan under the fundamental law of Oct. 31, 1931, is a constitutional monarchy, with legislative power vested in the King, a Senate of 40 members appointed by the King for life, and a National Assembly of 120 elected members. King in 1935, Mohammed Zahir Shah, who succeeded to the throne upon the assassination of his father, Mohammed Nadir Shah, on Nov. 8, 1933.

Press dispatches of July, 1935, reported that the Afghan Government had obtained the loan of a German Government official to make a two-year study of its communication and transportation systems with a view to their modernization.

AFRICA. See articles on the respective countries and territories, including EGYPT; ETHIOPIA; KENYA; MOROCCO; SOUTH AFRICA; UNION OF; TUNISIA; etc. See also ARCHAEOLOGY; EXPLORATION; PHILOLOGY; MODERN.

AGNES SCOTT COLLEGE. An institution for the higher education of women in Decatur (Atlanta) Ga., founded in 1889. The enrollment for 1935-36 was 500. The faculty number 50 and the administrative staff 14 members. The endowment is \$1,600,000, and the gross income for 1924-35 was \$270,000. There were 31,000 volumes in the library. During 1935 the gifts to the college were in excess of \$400,000. President, James Ross McCam, Ph.D.

AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA). See AGRICULTURAL EXTENSION WORK; AGRICULTURE; DAIRYING; LIVESTOCK.

AGRICULTURAL EXPERIMENT STATIONS. The national system of experiment stations functioned actively and efficiently during the year in every state of the United States, the territories, and major insular possessions. The income of the stations for the fiscal year ended June 30, 1935, approximated \$15,072,000, compared to \$14,188,455 in 1934, and \$18,056,000 in 1931 when station revenues were at the peak. Of the total, the Federal Government provided \$4,388,000, which comprised \$90,000 for each state, \$15,000 for Alaska, \$28,000 for Hawaii, and \$25,000 for Puerto Ri-

co. The Federal Station in Hawaii associated with the University of Hawaii at Honolulu also received \$32,977 from direct appropriations through the Department of Agriculture and \$31,000 from territorial and university funds. The Puerto Rico Station at Mayaguez received a Federal appropriation of \$35,959 and an allotment of \$113,000 from sugar-processing-tax funds, while the Insular Government Station at Rio Piedras received \$25,000 under the Puerto Rico Act of 1931 and \$111,328 from the Insular Government and other sources. Excellent progress was made toward the development of a coordinated research programme in which all stations in Puerto Rico participate.

The Bankhead-Jones Act signed by President Roosevelt June 29, 1935, providing for research into basic laws and principles relating to agriculture and for other purposes, authorizes an increase of the research funds of the experiment stations and the Department to the extent of \$1,000,000 for the fiscal year 1936 with an annual increment of \$1,000,000 each year until the appropriation reaches a continuing maximum of \$5,000,000 beginning with the year 1940. This appropriation is allotted on the basis of 40 per cent to the Department, and 60 per cent to the experiment stations in the States, Alaska, Hawaii, and Puerto Rico, the allotment to the stations, which is on the basis of rural population, to be offset by an equal sum from the States. The Act provides that all its grants are to be in addition to sums authorized by previous legislation.

The stations during the year worked on about 7000 projects which provided for research into almost every phase of farming and rural life. A large proportion of the station activities, especially those dealing with more urgent rural problems such as recovery and readjustment measures, were in co-operation with the U.S. Department of Agriculture. All of the 50 State stations and all but one of the research bureaus of the Department had formal cooperative agreements of some kind. There were also many examples of less formal cooperation. Many cooperative undertakings organized on an emergency basis as parts of the national recovery programme again were participated in by practically all the stations and Department bureaus.

The Office of Experiment Stations of the Department of Agriculture, as required by law and executive authorization, administered Federal funds provided by the Hatch, Adams, Purnell, and supplementary acts for the support of experiment stations in the several States and in Alaska, Hawaii, and Puerto Rico; sought to coordinate the work of the Department of Agriculture with that of the stations in every practicable way; administered the Federal stations in Hawaii and Puerto Rico; prepared and published the usual publications designed to aid in carrying out the purposes of the Federal Acts; issued *Experiment Station Record* which, under the editorship of Howard L. Knight, completed its 73d volume; and rendered various other special services to and for the experiment stations. Kansas State College conferred the honorary degree of doctor of science on James T. Jardine, Chief of the Office of Experiment Stations, at its June commencement.

Necessary research facilities were fairly well maintained during the year and a number of important improvements and additions to land were made possible through various emergency funds and private donations. The Hawaii Station erected a two-story concrete-block building costing \$68,000, to house station offices and laboratories. The Georgia Station built a fire-proof seed-barn at Ex-

periment and a community cannery at its mountain substation. A new greenhouse was built at the New Jersey Station for studies to determine the rôle of minor elements, and the Massachusetts Legislature provided a special fund for nursery research and for enlarging greenhouse and laboratory facilities at Waltham Field Station. An office building was being built at the Southeast Substation at Waseca, Minn., and also a laboratory to care for fundamental research in animal production. The Nevada Station rebuilt its dairy plant at Fallon, which largely had been destroyed by fire in November, 1934. To accommodate the regional erosion nursery for the Pacific Northwest and other forage and field crops work of the Department of Agriculture and the Washington Station, 160 acres more land adjoining the station farm was acquired. The Indiana Station added 80 acres for experimental plots to its adjoining soils and crops farm. The Florida Agricultural Research Institute gave the Citrus Substation at Lake Alfred 40 acres of land for development of citrus work. L. H. Bailey, professor emeritus of agriculture, and Mrs. Bailey presented Cornell University one of the most extensive herbariums in the United States. The gift comprised over 125,000 mounted herbarium sheets, together with 4000 technical books related to horticulture and botany, thousands of photographs, working equipment, etc., buildings housing the collection, and about $\frac{1}{4}$ acre of land. The university authorized the establishment of an administrative unit in the College of Agriculture to be known as the Liberty Hyde Bailey Hortorium.

The Kentucky and Minnesota Stations celebrated their fiftieth anniversaries during the year, and the Northwest substation at Crookston, Minn., observed the 40th anniversary of its establishment, all with appropriate ceremonies. Several changes in directorships occurred during the year, including P. V. Cardon, director of the Utah Station since 1928, who took charge of the Division of Forage Crops and Diseases of the Department of Agriculture, Bureau of Plant Industry. O. C. Magistad succeeded J. M. Westgate as director of the Hawaii Station. A number of directors were on leave, engaged in various emergency and recovery activities. Director J. H. Skinner of the Indiana Station received the honorary degree of doctor of agriculture from Michigan State College. R. A. Moore, head of the agronomy department of the Wisconsin Station, retired June 30 after 40 years' service. Farmer friends dedicated a memorial at Ashland, Wisconsin, to E. J. Delwiche, superintendent of branch stations of the Wisconsin station, for his untiring and unselfish efforts to help farmers in northern Wisconsin.

New research stations of the Department of Agriculture included the Rocky Mountain Forest and Range Experiment Station, with headquarters at Fort Collins, Col., in co-operation with the State College of Agriculture under the Forest Service to serve the Central Rocky Mountain States and under the direction of Dr. Richard E. McArdle of the University of Idaho. The U.S. Forest Service Equipment Laboratory was established at Spokane, Wash., under general supervision of Regional Forester E. W. Kelley, to assemble the technical resources of the Forest Service for improvement of forest work machinery. Additional erosion experiment stations were established by the Soil Conservation service at State College, Pa., Ithaca, N. Y., and at Mexican Springs, N. Mex. Ten others were transferred to this service Apr. 1, 1935, from the Bureaus of Chemistry and Soils and Agricul-

tural Engineering. (See also reports of the Chief of Forestry Service and of Chief of Soil Conservation Service, 1935.) The U.S. Department of the Interior was providing a 25-mile square area with equipment, 40 miles west of Burns, Oregon, for experimental livestock grazing in cooperation with the Oregon Station which was to conduct the research for the benefit of the Pacific Northwest. The main tract was to be stocked with 200 head of cattle and experimental bands of sheep will be grazed on supplementary land adjoining the main tract.

Necrology. Experiment station workers dying during 1935 included Robert C. Burdette, associate entomologist of the New Jersey Stations; James M. Bartlett, head of the chemistry department of the Maine Station; S. H. Essary, botanist of the Tennessee Station; James A. Neilsen, research assistant in horticulture of the Michigan Station; Charles I. Wade, treasurer of the Virginia Polytechnic Institute and Station; Alexander S. Alexander, head of the Wisconsin Station department of veterinary science 1903-30 and thereafter professor emeritus died July 12. Thomas C. Atkeson, long associated with the West Virginia University and station and prominent in the Grange and as an agricultural writer, died March 26. Louis G. Carpenter (q.v.), irrigation engineer, director of the Colorado Station 1899-1911, died September 12. James Dryden, expert poultry husbandman, connected with the Utah Station and with the Oregon Station (1907-30), died February 5. David Griffiths, botanist of the Arizona Station (1900-01) and subsequently with the Department of Agriculture, died March 19. William P. Cutter, librarian Bermuda Biological Station for Research, formerly librarian of the U.S. Department of Agriculture (1893-1900) and chemist Utah Station (1890-93), died May 22. Abram W. Harris, director of the office of Experiment Stations, 1891-93, and at one time president of the University of Maine, died February 21. Hugo de Vries (q.v.), emeritus professor of botany in the University of Amsterdam and internationally known for his contributions to genetics and plant breeding, died May 20. F. A. F. C. Went, retired professor of botany in the University of Utrecht, at one time (1891-96) director of the West Java Sugar Experimental Station, and currently president-elect of the International Botanical Congress, died July 24.

AGRICULTURAL EXTENSION WORK. Coöperative extension work in agriculture and home economics continued to grow in the esteem of the nation in 1935. Extension agents, who are the local representatives of the U.S. Department of Agriculture, the State land-grant colleges, and the agricultural counties of the country, met in 1935 steadily increasing calls from rural people for guidance in solving their problems of efficient farm and home management and marketing and in understanding and taking advantage of the

farm recovery programmes put into effect by the Agricultural Adjustment Administration, the Farm Credit Administration, and other agencies. More than 4,200,000 rural families made use of extension information. Extension agents visited more than 1,200,000 farms and farm homes, held over a million meetings for the discussion of important farm and home problems, and, with the aid of volunteer local leaders whom they had trained, completed a comprehensive attack on production and management problems in over 2700 counties.

Realizing the importance of extension work, Congress passed the Bankhead-Jones Act which provided \$8,000,000 for use during the fiscal year 1935-36. This amount is to be increased by jumps of \$1,000,000 each fiscal year for four years until the total of \$12,000,000 is reached in 1939-40. Of these new funds, \$20,000 go to each State and the Territory of Hawaii and the remainder is divided among them in the proportion that the farm population of each bears to the total farm population. With these additional funds work will be begun in completing the extension organization, which requires at least one agricultural agent, one home demonstration agent, and one 4-H club agent or assistant agent in every rural county where the number of farms, volume of work, and the State agricultural situation warrant such service.

At the end of the year there were 2838 county agricultural agents, 706 assistant agents, and 211 Negro agents working with farm men and boys; 1350 county home demonstration agents, 124 assistant agents, and 152 Negro agents working with farm women and girls; and 182 county club agents, 37 assistant agents, and 1 Negro agent devoted full time to boys and girls in the 4-H clubs. The administrative and supervisory staff, made up of 598 workers and 1428 specialists in various phases of agriculture and home economics, assisted the agents with their more technical problems. These workers, together with 912 supervisors and assistants in cotton adjustment, made a total staff of 8539 as compared with 7661 at the end of the previous year.

County agricultural agents continued to play an active and vital part in advancing the emergency measures to improve a stricken agriculture. The agent's office was the point of contact and clearing house between the farmers and the many agencies, engaged in agricultural relief. His biggest accomplishment was in helping the farmers to understand the need for agricultural adjustment and to meet the requirements of adjustment contracts. In this work, the agents were assisted by county and community committeemen whom they had previously trained.

Extension workers and farm people began during the year an intensive study of facts regarding the local and national agricultural situation in an attempt to determine what adjustments are necessary in farming systems and production practices, both as they relate to farm income and conservation of the soil.

Many States set up during the year local groups for the discussion from all angles of some of the important questions of the day. Using material prepared by the Department of Agriculture and the State agricultural colleges and supplementing this material with facts from local and other sources, farm people were encouraged by extension agents to discuss freely and openly problems of international, national, and local interest.

As a result of the reduction in crop acreages involved in the adjustment programmes, farmers

wanted to use every precaution to insure productive crops on the acres remaining in cultivation. Consequently, county agents received more than the usual number of calls from farmers and gardeners for instructions which would be helpful in preventing loss and spoilage from blights, rots, and other plant diseases. In many States the insect problem was very important during the year. The clouds of grasshoppers and the hordes of chinch bugs which plagued farmers in some of the Central and Western States were fought with every resource of county, State, and nation—result: more than 20,000,000 acres of crops were protected. Livestock disease control was given increased emphasis by county agents, who also helped farmers to solve such livestock problems as inexpensive silo construction, better feeding, improvement of quality of stock, marketing, cutting and curing of meats, and the like.

Agents continued to assist the Farm Credit Administration and local production credit association in explaining Government credit facilities to farmers and in helping them to take advantage of the opportunity for financing farm activities at a reasonable rate of interest.

The increased use of economic outlook information, farm accounting, cost control, farm analysis, budgeting, and other methods designed to improve farm management efficiency and increase profits, were fostered by the agents.

The widespread need among rural people to conserve and improve the soil and to rebuild or maintain their farm homes caused agents to give more than ordinary attention to measures designed to keep the farm home self-supporting. Farmers were advised in the best practices of erosion control, use of lime, the growing of more legumes and grasses for good pasture, tree planting control measures, and similar methods of maintaining or increasing soil productivity. Repair and maintenance of farmhouses and buildings were recognized as a pressing need and both county agents and home demonstration agents cooperated with the Federal Housing Administration in giving rural families information on farm housing and relief. Groups of farmers were also aided in obtaining the use of electricity through the extension of electric lines by the Rural Electrification Administration.

The extension service cooperated with the Resettlement Administration in rehabilitating distressed farmers and putting them on a basis where they may become self-supporting.

Home demonstration agents, too, have had their part in the forward movements under way to place the farm in its proper position in the national economic pattern. The general awakening of farm women to new possibilities created by the modern rural trend immeasurably increased the responsibilities of home demonstration workers.

The principal efforts of the agents were focused upon the conservation of cash, the protection of health, and the maintenance of morale. To aid the farm homemaker in utilizing to the best advantage her limited resources, home demonstration agents placed considerable emphasis on the live-at-home programme, upon budgeting funds, keeping household accounts, wise buying, remodeling and care of clothing, food preservation, home-made equipment, and the like. An effort was also made to help the farm women increase the family income. They were taught to prepare and market graded and standardized fruit, garden, dairy, and poultry products and to organize and manage curb markets

and wayside stands for the sale of their products.

Recognition of the economic importance of health to the individual and of its relationship to morale has heightened interest among farm women in obtaining help to improve their living conditions. Home sanitation, construction of sanitary toilets, screening of windows and doors, better ventilation, better posture, disposal of sewage, and installation of running water were some of the matters directly related to health upon which home demonstration agents and specialists gave advice.

Home demonstration agents recognized the need among farm women for recreation, hobbies, and for the development of appreciation of good music, art, books, plays, and for other healthful and cultural pursuits for their leisure moments. Farm women were also helped in many ways in the year, including improvement and beautification of farm home interiors and exteriors, child development and parent education, kitchen improvement and rearrangement, and the like.

Due to the emergency, it was difficult for county agricultural agents and home demonstration agents to give as much time as formerly to farm boys and girls in the 4-H clubs. Plans for club work were adjusted to meet existing situations. These young farm people, under the guidance of extension agents and local leaders, discussed present-day agricultural problems and thus equipped themselves to become farmers and homemakers, to play a prominent part in future farm programmes and to be leaders in rural community organizations. Among other things, club members learned about soil conservation, forestry, range management, farm record keeping, home beautification, health, music, gardening, livestock, and handicraft.

The total funds allotted for cooperative extension work in the States and Territories during the fiscal year 1935-36 amounted to \$28,780,000, an increase of \$8,738,000, or 43½ per cent more than the amount available during the previous year. Much of the new funds provided were in substitution for grants made to the Extension Service during the previous two years by the Agricultural Adjustment Administration. Of the total funds allotted \$16,936,000 came from Federal sources and \$11,844,000 from sources within the States and Territories.

AGRICULTURE. Features of American agriculture in 1935 included substantial farm recovery which aided general recovery; increases in acreage and production of crops with somewhat lower prices for farm products, and a sizable increase in gross income over 1934; great changes in the weather conditions affecting agriculture compared with 1934; beneficial effects of the activities of the Agricultural Adjustment and Farm Credit

Administrations; continued advances in agricultural credit conditions; continued improvement in farm real estate values and in the tax situation; rise in farm population and better living conditions on the farm; increase in consumer demands for farm products; decline in exports and increase in imports of agricultural products; and reductions in burdensome surpluses of basic farm commodities (except cotton). The several factors active in the agricultural industry in 1935 are treated in greater detail in the following pages.

Agricultural Situation. The gross income from farm production of the United States for 1935 was tentatively estimated by the U.S. Department of Agriculture at \$8,110,000,000, compared with \$7,266,000,000 for 1934 and \$5,337,000,000 in 1932, the low point of the depression. Rental and benefit payments which contributed materially to farm income since 1933 and are included in the above estimates were estimated at about \$480,000,000 from the crop adjustment programmes of 1935 compared with \$594,000,000 paid on 1934 programmes. Cash income from 1935 production was about \$6,900,000,000, which was 10 per cent over that received in 1934. The increased value of goods retained for home consumption, about \$1,200,000,000 versus \$1,037,000,000 in 1934, resulted from better conditions for farm gardens and marked increase in prices and relatively stable farm consumption of livestock products. A pronounced rise in income came from both crops and livestock from 1934 to 1935. The increase in income from livestock and livestock products was fairly general, whereas that from crops was most marked in grains, vegetables, and sugar.

Farmers' expenditures again rose less than gross income so that the actual position of the farm operator had improved more during 1935 than was indicated by increase in gross income. Increases in current expenditures for production and for wages to hired labor appeared to be only moderate, being offset partly by lower interest rates on farm mortgages. Marked increases in tax levies on farm property were not anticipated for 1935. Indications were that current production expenses plus wages, taxes, interest, and rent payable, and depreciation of buildings and equipment would amount to about \$4,000,000,000 in 1935 compared with \$3,832,000,000 in 1934. This deduction for production expenditures left available to farm operators for labor, capital, and management an income of about \$4,110,000,000, the largest return since the \$5,669,000,000 in 1929.

The greater income of farmers in 1935 was accompanied by marked increases in purchases of commodities both for the family and for production, being most noticeable in clothing, house furnishings, farm machinery, automobiles, and building materials. The increase in farm income evidently enabled farmers to improve their standard of living to more nearly the level prevailing in 1925-29, and the rise in farmers' purchasing power was instrumental in improving economic conditions from the retail merchant in small towns back to the manufacturer and the producer of raw materials.

Agricultural Credit. Continued improvement in agricultural-credit conditions evident in 1935 resulted from the increase in farm income in each year since 1932, together with measures taken to reduce farmers' debt burdens. Although the debt situation of many farmers, particularly in areas which suffered from drought, was still unsatisfactory, higher prices for farm commodities brought farm incomes into better alignment with fixed

charges such as interest and taxes. Interest rates on farm mortgage loans increased during 1935 and were at the lowest level on record. Additional reductions in interest payments were effected under the refinancing programme of the Farm Credit Administration. Federal land bank loans were being made at 4 per cent per annum, these loans bearing a temporary rate of 3½ per cent for the year ending June 30, 1936, under provisions of the Farm Credit Act of 1935. Commercial banks and individuals in many areas were quoting rates lower than formerly for desirable mortgages. Most insurance companies decreased their rates from ¼ to ½ per cent during the year, some loans being made at as low a rate as 4½ per cent. Commission charges on loans by insurance companies were also reduced greatly or entirely eliminated. These reductions, indicative of a permanent lowering in the average interest rate charged on farm mortgages might be expected, eventually, to be recapitalized in part in relatively higher land values. Improvement in facilities for providing short- and intermediate-term credit for farmers was characterized by further increase in deposits of country banks and in loan operations of the production credit associations.

The agricultural loans outstanding late in 1935 included farm mortgage loans by 39 life insurance companies \$821,000,000 up to Sept. 30, 1935, a progressive decline from \$1,606,000,000 in 1927; and, as of June 30, 1935, banks of the Federal Reserve System, \$259,000,000. Up to Oct. 31, 1935, Federal land banks had outstanding \$2,059,000,000; joint stock land banks \$184,000,000; and land bank commissioners' loans to farmers \$777,200,000. Federal intermediate credit bank loans to regional agricultural credit corporations and production credit associations totaled \$101,000,000 and to other institutions \$53,000,000. Production credit associations loaned \$95,900,000, and regional agricultural credit corporations \$52,000,000. Outstanding emergency crop loans totaled \$114,000,000 and drought loans \$69,000,000.

Agricultural loans by commercial banks at the beginning of 1935 totaled \$1,306,455,000. Loans secured by farm real estate, \$498,842,000, were 38.2 per cent of the total; \$104,152,000 or 8 per cent secured by livestock only; \$159,785,000 or 12 per cent by crops and equipment, or by livestock, crops, and equipment; \$144,845,000 or 11 per cent by warehouse receipts; \$52,491,000 or 4 per cent by other collateral; and \$346,339,000 or 26.5 per cent were unsecured.

Farm Real Estate. Farm real estate values increased during the year ended Mar. 1, 1935, for the second successive year. The greatest advances relative to a year ago took place in the Southern States. There were substantial gains in the East North Central States and in Iowa. In the western part of the Middle West and in certain areas of the Southwest, however, the drought of 1934 influenced valuations adversely. The general improvement the country over was attributed by the U.S. Department of Agriculture to increased farm income, continuation of relieved credit conditions, reduced taxes on some land, and lessened pressure of forced liquidation. Creditor agencies with farms for sale in some cases raised their asking prices, and the general tone of the farm real estate market improved materially. The value of all farm land and buildings in the United States was estimated at \$32,696,000,000 as of Mar. 1, 1935, compared with \$31,655,000,000 on Mar. 1, 1934, and \$30,306,000,000 on Mar. 1, 1933, the low point in more than 15 years. The peak was \$66,316,000,000 in 1920, and

for 1929 the figure was \$47,926,000,000. The acre value for all farm lands with improvements, averaged for the country as a whole, rose to 79 per cent of the prewar value during the year ended Mar. 1, 1935, compared with 76 per cent for March, 1934, 73 for March, 1933, and 89 for March, 1932. The index was 170 at the 1920 peak. Frequency of changes in ownership per 1000 farms due to voluntary sales or trades rose from an average of 17.8 in the year ended Mar. 15, 1934, to 19.4 in 1935; forced sales due to foreclosures, etc., declined from 28 to 21 per 1000 farms; and due to delinquent taxes from 11.1 to 7.3 farms per 1000.

Taxes. Average taxes on farm real estate per acre for the United States as a whole, the U.S. Department of Agriculture reported late in 1935, decreased 14 per cent from the levy of 1932 to that of 1933, and 5 per cent from 1933 to 1934. The 1934 figure was 36 per cent below the 1929 peak, but still 54 per cent above the base year, 1913. In relation to farm real estate values, taxes continued to rise until 1932, and since declined 26 per cent. In 1934, however, taxes per \$100 of value still averaged more than 100 per cent above 1913. Taxes per acre averaged 37 cents in 1934 compared with 39 in 1933, 46 in 1932, 58 in 1929, the peak year, and 24 cents in 1913. That the 1935 levies for the country as a whole would not differ greatly from those of 1934 was indicated by estimates based on personal judgments of State tax commissioners and tax experts in more than half of the States. Benefits to farm owners from recent property-tax decreases were partially offset by substitute taxes. Nearly half of the States enacted general or retail sales taxes in 1932 and later years. Also, farmers paid part of special sales taxes and privilege taxes, revenue from which replaced property-tax revenue to a considerable extent.

Prices. The index of prices received by farmers at local farm markets for agricultural commodities was estimated at 110 per cent of the five-year prewar average on Dec. 15, 1935, 9 points higher than a year earlier. Livestock and livestock products averaged much higher in price than a year ago, while prices received for field crops were generally lower. The average prices received by producers, Dec. 15, 1935, based on reports to the U.S. Department of Agriculture Crop Reporting Board, were estimated for corn 53 cents per bushel, wheat 90.1, oats 25.5, barley 37.5, rye 40, flaxseed 156.4, rice (rough) 70.1, potatoes 64.2, and apples 76.6 cents per bushel, tobacco 17.3 and cotton 11.4 cents per pound, cotton seed \$32.95 and hay \$7.20 per ton. Hogs sold for \$8.72 per 100 pounds, beef cattle \$6.14, veal calves \$7.86, lambs \$8.15, and sheep \$4.21. Eggs were 28.7 cents per dozen, butter 29.8 cents per pound, and whole milk wholesaled at \$1.84 per 100 pounds and retailed at 9.9 cents per quart. Wool brought 23.3 cents per pound and live chickens 16 cents. Milk cows sold for \$51.60 each, horses \$90.60, and mules \$105.90. The corn-hog ratio (number of bushels needed to buy 100 pounds of hogs) was 16.5 versus 15.1 in November, 6 in December, 1934, and 7 in December, 1933.

Exports. Agricultural products exported from the United States, exclusive of forest products, declined in value to \$668,779,000 during the year ended June 30, 1935, as compared with \$787,347,000 during 1933-34, a loss of about 15 per cent, and 65 per cent below the five year average (1924-25 to 1928-29) of \$1,948,000,000. Agricultural products made up 32 per cent of the value of all exports versus 39 during 1933-34. Exports of live animals, dairy products, eggs and egg products, hides and

skins, meats, fish, oils and fats, sugar, tobacco, and vegetables and preparations all show increases in value over the preceding year, totaling up to \$35,105,000. Decreases appeared for animal oils and fats, wool and mohair, miscellaneous animal products, fruits and preparations, grain products, oil cake and oil-cake meal, and miscellaneous vegetable products, totaling \$41,904,000. While the opposite movement of these two classes nearly offset changes in value, the value of exports of cotton declined by \$112,000,000 to account for the major share of the loss in the total value of agricultural exports of 1934-35. The volume index stood at 54 per cent of prewar compared with 83 per cent in 1933-34 and with the previous low level of 50 per cent in 1876-77.

Unmanufactured cotton, 5,066,000 (fiscal year) bales, valued at \$326,877,000, represented 48.8 per cent of the agricultural export value; unmanufactured tobacco, 374,658,000 pounds, valued at \$120,514,000, 18 per cent; fruits and their preparations 10.6 per cent; animals and animal products 10.4 per cent; and grains and grain products 4.8 per cent. See also *Foreign Crops and Markets* 31 (1935) No. 14, pp. 471-478; 18, pp. 605-623.

Imports. The agricultural products (excluding forest products) imported into the United States during the year 1934-35 showed an increase in value and for certain commodities an increase in volume over 1933-34. The total import value amounted to \$969,297,000 versus \$858,912,000 in 1933-34, and exceeded the value of agricultural exports for 1934-35 by \$300,518,000. Agricultural imports made up 54.2 per cent of all imports. Fairly large increases shown by a number of commodities, including cattle, canned beef, butter, feeds and fodders, and some of the grains, were attributed to the severe drought of 1934. On the other hand, the value of imports of some products normally imported in substantial volume, such as wool, flaxseed, and tobacco, declined.

The values of 20 leading agricultural products imported during 1934-35 were for coffee \$135,169,000, sugar \$124,514,000, crude rubber \$112,875,000, raw silk \$74,572,000, feed grains \$29,359,000, bananas \$26,593,000, cocoa or cacao beans \$24,384,000, unmanufactured tobacco \$23,981,000, unmanufactured wool, \$17,466,000, tea \$17,172,000, goat and kid skins \$14,858,000, flax seed \$14,730,000, cheese \$10,644,000, sausage casings \$10,120,000, tallow \$9,086,000, cattle hides and calf skins \$8,819,000, coconut oil \$8,487,000, tung oil \$8,197,000, unmanufactured cotton \$7,870,000, and barley malt \$7,854,000.

The significance of imports and exports of farm commodities and of foreign trade to American agriculture has been interpreted by Secretary of Agriculture Wallace in his report for 1935 (pp. 14-28). See also *Foreign Crops and Markets* 31 (1935) No. 21, pp. 702-708; 23, pp. 771-791.

Population. The farm population of the United States was estimated from U.S. Department of Agriculture surveys at 32,779,000 on Jan. 1, 1935, again establishing an all-time peak, as compared with 32,509,000 on Jan. 1, 1934. The movement from towns and cities to farms totaled 783,000 and the cityward movement amounted to 994,000, but balancing births and deaths and these movements resulted in a net gain of 270,000 persons in farm population, just 3000 larger than the small gain of one year earlier. In 1933, each major geographic division showed small net gains ranging from 1.4 per cent in the East South Central States to 0.2 per cent in the Mountain and Pacific States while in

1934 the Pacific States gained 1.7 per cent, the Mountain States lost 1.2 per cent, and the West North Central States lost 1.1 per cent. The drought was held responsible for some of these contrasts. The reduction in farmward migration in northern and northeastern industrial States probably was the combined result of a farm-housing shortage, somewhat better employment opportunities in non-agricultural industries, and the larger cash relief payments generally available to urban residents as contrasted to rural dwellers.

Outlook. A summary of facts bearing upon the agricultural situation in 1935 and probable developments with respect to agricultural production and marketing in 1936, concerned with domestic and foreign demand, agricultural credit, farm labor, equipment, and fertilizer, the farm family living and the status and future of field crops, vegetables, fruits, livestock, poultry, and their products, prepared by the Bureau of Agricultural Economics, U.S. Department of Agriculture, assisted by State and other Federal agencies, was presented in *The Agricultural Outlook for 1936*. (Misc. Pub. 235, 1935). Consult also *The Agricultural Situation* ([monthly] U.S. Dept. of Agri.), and *The Farm Real Estate Situation*, by B. R. Stauber and M. M. Regan (U.S. Dept. of Agri. Circular 382).

Aftermath of the 1934 Drought. The weather conditions affecting agriculture in 1935, according to the U.S. Department of Agriculture, contrasted strikingly with those of 1934. The general drought of 1934, which had prevailed widely over the country, came to an end. In areas which had suffered worst, rain enough fell to check wind erosion, allay dust storms, and promote crop growth. The central valleys had too much rain, at any rate during spring and early summer; and less than the usual percentage of the country suffered from deficient moisture.

The drought of 1934 began to break in the fall months, when timely rains relieved the acute situation in most regions and prepared the soil for winter cereals. The eastern and northern Great Plains, which had suffered tremendously during the crop-growing season, were especially favored. Only in the southwestern part of the Wheat Belt did the drought persist. Additional relief came to most areas in the 1935 spring, with the continued exception of the southwestern Great Plains. Early spring rains in the northern Great Plains, where dust storms were severe in 1934, prevented widespread harmful soil drifting, and created favorable crop prospects. Finally, in May, heavy rains fell also in southwestern Kansas, southeastern Colorado, northwestern New Mexico, western Oklahoma, and the Texas Panhandle, and ended the droughty, dusty conditions there, although only temporarily in a considerable southwestern area. For following the heavy May rainfall, June and July again had marked deficient precipitation, and drought conditions were reestablished. By the end of July, scanty rainfall and high temperatures produced drought conditions throughout the Plains and Rocky Mountain States. In the central valleys, where drought in 1934 approached the disaster point, rainfall in the spring and summer of 1935 was excessive and caused floods and serious crop damage. Most States farther west had ample irrigation water, mountain snowfall the previous winter having been heavier, and the irrigation water supply much greater than in 1934. In the area from Montana westward, however, the precipitation was insufficient. Up to July 1, most States had received more than normal rainfall,

particularly in the interior of the country, where the excess for the half year ranged from 20 to 50 per cent above normal.

Although the great drought ended in 1935, its effects, chiefly on farm prices and current farm incomes and on farm methods and types of farming, did not. The drought disguised the true relationship between the real capacity of the farms for production and the demand for farm products gave a new impulse to unbalanced production, and complicated the adjustment problem. The direct effects on types of farming in the drought areas and indirect effects in other regions were likewise complicated and important. In normally droughty territory the drought caused a serious loss of topsoil through wind erosion, emphasized the necessity for returning certain tracts to grass, indicated advantages of more diversification, and showed the unwisdom of prevailing tillage methods. It also completed the ruin of many farmers who were unable to make ends meet even before the drought. These effects in combination might ultimately cause farmers in the normally droughty territory to change their methods greatly. In areas not usually droughty the worst effects were expected to be temporary. Regions where the drought did little crop damage, as the eastern Cotton Belt and the northeastern dairy region, nevertheless felt the economic repercussions of the drought's effects elsewhere. A serious farm-rehabilitation problem was left in the worst drought areas. The drought burdened many farmers with debt which they could not hope to carry even under improved economic conditions, and created a difficult problem of refinancing. The Farm Credit Administration refinanced a considerable number of farmers, but its facilities were inadequate for the extreme cases.

Crop Production. The area of the principal (44) crops harvested in the United States in 1935, exclusive of fruits and nuts, was estimated to be 327,661,000 acres, about 14 per cent more than the greatly reduced acreage harvested in 1934 and 8 per cent less than the average production during the 1928-32 period. The total acreage of 44 principal crops was below the usual average chiefly in the Great Plains, where the great drought continued till late in the spring, and in the central and western Corn Belt where continued wet weather in May and early June interfered greatly with field work. Due in part to control programmes, the total area of corn, wheat, and cotton harvested was about 30,000,000 acres below the 1928-32 average. The acreage of oats and barley was about average. The area in sorghums and soy beans, both favored during recent dry years, was about 7,000,000 acres above the five-year average. Lespedeza also was increasing very rapidly and a greatly increased acreage of timothy was harvested for seed in 1935. Crop yields per acre harvested were 25 per cent above yields secured in 1934 but only 1.7 per cent above the usual average. The low yield of spring wheat due to rust and slightly below-average yields of corn, sorghums, and potatoes were more than offset by the heavy yield of hay and the slightly above-average yields of cotton, annual legumes, rice, and tobacco.

The farm value of the 1935 crops in the United States was estimated to be \$5,118,444,000 compared with \$4,779,335,000 in 1934, \$4,114,265,000 in 1933, and \$2,882,195,000 in 1932, and \$4,102,354,000 in 1931. Prices received for this season's crops were about 13 per cent below those received for the short crops of 1934, but with heavier production the ag-

gregate value of the 1935 crops exceeded the value of 1934 crops by 7 per cent. The income derived from crop production of 1935 was expected to total about \$3,400,000,000, nearly 12 per cent over returns from the 1934 crops, and the income from livestock and livestock products was expected to approach \$4,230,000,000, an increase of 16.6 per cent. Benefit payments received by farmers in 1935 were less than in 1934 but farmers' income from production and benefit payments combined was expected to total \$8,110,000,000, nearly 12 per cent over 1934.

The 1935 wheat crop of the United States was estimated at 603,199,000 bu., 21 per cent above last year's very short crop of 496,929,000 bu., but 30 per cent below the 1928-32 average production of 860,570,000 bu. The total acreage harvested in 1935 of 49,826,000 acres compared with 42,249,000 acres harvested in 1934 and the 1928-32 average of 59,885,000 acres. The acreage harvested and the total production were for winter wheat 31,000,000 acres, 433,447,000 bu.; durum 2,644,000 acres, 26,777,000 bu.; and other spring wheat 16,182,000 acres, 142,975,000 bu. The 1935-36 wheat production of 47 countries which produced the greater part of the 1934-35 world wheat crop, exclusive of Russia and China, was officially estimated to total 3,363,039,000 bu. compared with 3,351,607,000 in 1934-35. The Canadian wheat crop amounted to 273,971,000 bu. versus 275,849,000 in 1934. The 1935-36 production in 30 European countries was reported at 1,546,413,000 bu. versus 1,535,056,000 in 1934-35. See WHEAT.

The corn crop in 1935, estimated at 2,202,852,000 bu., was 60 per cent larger than the short crop of 1934 and 14 per cent below average production of the five years, 1928-32. The total acreage, 92,727,000 was 5.6 per cent over that of 1934, 87,795,000 acres, whereas the five-year average was 102,768,000 acres. The yield per acre averaged 23.8 bu., compared with 15.7 in 1934 and 25.7 bu. the 10 years (1923-32) average. Corn produced for grain was estimated at 1,923,559,000 bu., and the remainder of the corn crop was used for silage, fodder, hogging, and grazing. Corn production in 14 foreign northern hemisphere countries amounted to 604,284,000 bu., about 17 per cent below the crop from the same countries last year. Eight European countries reported a total of 501,697,000 bu. versus 562,058,000 in 1934. See CORN.

The oats crop of 1935 was estimated to be 1,195,435,000 bu., more than double the extremely light production of 525,889,000 bu. in 1934 and harvested from 39,714,000 acres, compared with 30,172,000 acres in 1934 and 1.8 per cent below the five-year (1928-32) average production. The yield per acre averaged 30.1 bu. versus 17.4 bu. in 1934 and 30.3 bu. the 10 year average. Oats production in 29 northern hemisphere countries accounting in 1934 for nearly all of the world total, excluding Russia and China, amounted to 3,182,625,000 bu. in 1935 compared with 2,453,451,000 in 1934, and that of 24 European countries 1,517,116,000 bu., a decrease of about 3 per cent from 1934. The Canadian crop was estimated at 442,392,000 bu. See OATS.

Barley production in 1935 was estimated to total 292,249,000 bu. raised on 12,858,000 acres averaging 22.7 bu. per acre compared with 118,348,000 bu. on 7,095,000 acres averaging 16.7 bu. in 1934. The increased production in 1935, which slightly exceeded the 1928-32 average, was the result of increased acreage and appreciably higher yield per acre. The barley crop in 36 northern hemisphere countries was estimated to be 1,304,440,000 bu., ver-

sus 1,173,374,000 bu. in 1934. The crop in 25 European countries reporting showed a total of 635,893,000 bu., and in Canada 94,550,000 bu. See BARLEY.

The 1935 rye crop of 57,936,000 bu. was the largest crop since 1924 and was produced on 4,063,000 acres compared with the extremely small crop of 16,045,000 bu. on 1,942,000 acres in 1934. Rye averaged 14.3 bu. per acre in 1935 and 8.3 in 1934. The crop in 1935 in 30 countries reporting, accounting for the greater part of the world production of rye, except Russia and China, was estimated to total 962,340,000 bu. against 926,120,000 bu. in 1934. Buckwheat production totaled 8,234,000 bu. from 496,000 acres versus 9,042,000 bu. from 478,000 acres in 1934. Rice made 38,452,000 bu. on 784,000 acres, compared with 38,296,000 bu. harvested from 781,000 acres in 1934. See RYE, RICE.

Flaxseed production in 1935 totaled 14,931,000 bu. from 2,071,000 acres as compared with 5,213,000 bu. and 969,000 acres in 1934. Most of the increase in acreage in 1935 occurred in the Dakotas. Grain sorghums produced an estimated equivalent of 103,494,000 bu. from 10,470,000 acres versus 34,542,000 bu. from 7,569,000 acres in 1934. The portion of the acreage harvested for grain produced 57,045,000 bu. versus 18,558,000 bu. in 1934. The record acreage planted was due to the great need for feed in the dry lands of the Central and Southern Plains. Broomcorn production in 1935 amounted to 60,500 tons from 489,000 acres, compared with 32,000 tons from 302,000 acres in 1934.

Production of sorghum (sorgo) sirup in 1935 amounted to 12,438,000 gal.; sugar-cane sirup, 24,699,000 gal.; maple sugar, 1,704,000 lb.; and maple sirup, 3,377,000 gal. The sugar-beet crop of 1935 was estimated at 7,984,000 tons of beets from 771,000 acres, expected to produce about 1,170,000 tons of sugar, compared with the five year (1928-32) average production of 8,118,000 tons of beets from 717,000 acres. In 1935, acre yields were about average whereas the sugar content was reported to be about 10 per cent better than average. The area of 258,000 acres of sugar cane in Louisiana harvested for sugar, sirup, and seed was expected to produce 291,000 tons of sugar, 57,000 tons more than in 1933, 21,034,000 gal. of molasses, and 6,598,000 gal. of sirup.

The 1935 hay crop of 87,620,000 tons which included 75,619,000 tons of tame hay and 12,001,000 tons of wild hay, was 54 per cent more than the exceedingly small crop of 57,028,000 tons in 1934, and 9 per cent above the 1928-32 average of 80,384,000 tons. Harvested acreages of both wild and tame hay rose from the low figures of 1934, with decreases in acreages of clover and timothy, sweet clover, grain hay and annual legumes more than offset by increases in acreages of alfalfa and lespedeza. The acreage harvested totaled 64,488,000 acres. The principal factor in the large production of hay in 1935 was the high yield per acre of certain important kinds. The important kinds of tame hay produced included alfalfa, 29,066,000 tons, clover and timothy, 26,611,000 tons; sweet clover, 663,000 tons; lespedeza, 1,214,000 tons; annual legume hay, 5,862,000 tons; grain hay, 5,009,000 tons; sweet sorghum forage, 5,536,000 tons and other hay crops, 7,194,000 tons. The production of the principal hay seeds in 1935 was lower than in 1934 with the exception of timothy and alfalfa seed. See HAY.

The potato crop was estimated at 356,406,000 bu. compared with 385,421,000 bu. in 1934 and the average acre yield 109 bu. versus 116.4 in 1934. The sweet potato crop was estimated to be 69,853,000 bu., peanuts harvested for picking or threshing at

1,264,455,000 lb., cowpeas harvested for peas, 5,816,000 bu., and soy beans harvested for beans, 39,637,000 bu., more than double the previous record production of 18,627,000 in 1934. See POTATOES.

Tobacco production in 1935 was estimated at 1,283,742,000 lb., about 23 per cent larger than the 1934 crop, from 1,458,000 acres, an increase of 15 per cent. The increase was accounted for mainly by an increase of about 230,000,000 lb. or about 41 per cent in the production of flue-cured tobacco. Flue-cured tobacco was estimated at 785,993,000 lb. compared with 556,930,000 lb. in 1934; fire-cured, 120,887,000 lb.; burley, 234,361,000 lb.; Southern Maryland, 26,350,000 lb.; dark air-cured, 33,871,000 lb.; cigar filler, 42,530,000 lb.; cigar binder, 32,090,000 lb.; and cigar wrapper, 7,485,000 lb. See TOBACCO.

The United States cotton crop in 1935, according to December 1 estimates, was 10,734,000 bales, about 1,098,000 bales greater than the small 1934 crop, and 3,932,000 bales, or 26.8 per cent below average production in the period 1928-32, and the cotton was harvested from 27,331,000 acres, about 1.3 per cent greater than in 1934. The yield of lint per acre averaged 188 lb. in 1935 and 170.9 in 1934. The farm value of the lint was estimated at \$593,677,000 and the 4,775,000 tons of seed at \$150,877,000. Exports of cotton during the cotton year ended July 31, 1935, totaled 4,798,539 running bales compared with 7,534,415 in the previous year. See COTTON and articles on other individual crops.

Agricultural Adjustment. The Agricultural Adjustment Administration (AAA) continued in 1935 with Chester C. Davis as administrator. This organization, according to M. L. Wilson, assistant Secretary of Agriculture, had been one of the most significant institutions established in the history of American agriculture. It provided a means for farmers to work together in meeting the problem of extremely low prices and markets sharply reduced through the loss of impoverished foreign customers, high tariffs, quota, and other restrictions to international trade. It improved the purchasing power of farmers and improved the market for the nation's industries through increasing the buying power of rural people. The immediate effects would not provide a true measure of either the accomplishments or the planning of the Adjustment Administration. In fact, except for the lack of assurance of a balance between supplies and requirements for farm products in the future, most lines of agricultural production from the standpoint of income were currently relatively favorable, due to a very large extent to the Adjustment Administration and the cooperation of more than three million farmers in the programme.

The year 1935 was featured by a number of important amendments to the Act, approved Aug. 4, 1935; a reorganization of the administration; greater flexibility in and a number of modifications in programmes (see below); cooperation with State agricultural experiment stations in efforts toward a regional approach to adjustment programmes; and widespread litigation in the courts questioning the constitutionality of the AAA programmes, with suits restraining the collection of processing taxes. On Jan. 6, 1936, the Adjustment Act was declared unconstitutional by the Supreme Court of the United States, and on Jan. 13, 1936, the Supreme Court ruled that impounded processing taxes, \$180,000,000, as of Dec. 31, 1935, should be returned to processors. See THE NEW INTERNATIONAL YEAR BOOK for 1933

(pp. 20-21) and 1934 (pp. 17-20) for details of organization and earlier activities.

Expenditures and Receipts. The AAA reported that during the 1935 fiscal year it expended a total of \$807,686,134, including \$563,438,812 in rental and benefit payments to farmers under adjustment contracts in five commodity programmes; \$12,591,001 for removal and conservation of surplus agricultural commodities; \$148,520,819 for drought relief, food conservation, and disease eradication activities; \$13,704,070 in connection with trust fund operations; \$38,583,642 for administrative expenses; \$30,292,782 for refunds of taxes; and \$737,005 for disbursement expense. The funds available included \$71,572,151 in processing tax receipts available July 1, 1934, and \$281,565,270 from appropriations and trust funds; and additions of \$526,222,358 in processing tax collections, and \$111,924,702 from appropriations, trust funds, and other sources. Rental and benefits during the fiscal period included cotton, \$116,195,930; wheat, \$98,223,175; tobacco, \$28,767,914; corn-hogs, \$302,407,647; sugar, \$17,844,145. Removal of surplus operations, involving total expenditures of \$12,591,001 comprised hogs, \$1,426,470; wheat, \$1,087,744; dairy products, \$9,037,240; sugar, \$365,536; and peanuts, \$674,008. Drought relief, food conservation, and disease eradication operations expenditures were \$11,486,937 spent in connection with cattle disease eradication, and \$111,540,027 in the purchase of drought cattle; \$7,709,879 for drought sheep and goats; \$17,780,661 in conservation of adapted seeds in the drought area; and \$3314 in connection with the feed and forage conservation programme. Trust fund operations included \$13,653,325 distributed to producers pooling their excess cotton-tax-exemption certificates for sale to producers with excess cotton, and \$50,745 distributed from a rice trust fund set up under the southern rice marketing agreement.

By commodities the collections from processing taxes, etc., during the year ended June 30, 1935, totaled \$526,222,358 including wheat, \$123,860,932; cotton, \$95,926,302; tobacco, \$32,725,501; corn, \$6,849,630; hogs, \$184,601,009; paper and jute, \$3,221,707; sugar cane and sugar beets, \$71,093,971; peanuts, \$3,571,936; rice, \$29,120; cotton ginning tax, \$1,110,875; and tobacco sales tax, \$3,231,375.

Payments under the various commodity programmes during the calendar year 1935 were estimated as follows: Cotton, \$125,000,000; wheat, \$128,750,000; corn-hog programme, \$249,000,000; sugar, \$50,500,000; tobacco, \$30,000,000; rice, \$6,600,000; and peanuts, \$3,600,000. Including the drought cattle purchase and seed conservation programme, expenditures by the AAA in surplus removal activities amounted to approximately \$203,925,000 by Nov. 1, 1935.

Programmes. Three major types of administrative programmes were administered by the AAA: (1) The processing tax-benefit payment programme, under which excise taxes were levied upon the processing of certain basic agricultural commodities and a sum equal to the proceeds of the taxes appropriated for certain purposes including benefit payments to farmers who voluntarily enter into contracts to adjust acreage; (2) the marketing-agreement and order programme, under which the U.S. Secretary of Agriculture entered into agreements with distributors and handlers of specified agricultural commodities and issued orders binding upon them to prohibit unfair marketing practices, to regulate the marketing of the

^a The production given countries of the Southern Hemisphere is for the crop years, 1934-35 and 1933-34.
 Where no figures are given, statistics are not available

commodities, and in the case of milk and its products to fix minimum prices to be paid by distributors to producers; and (3) the Bankhead Cotton Act, the Kerr Tobacco Act, and the Potato Act of 1935, which authorized marketing allotments and imposed a special tax on the marketing of the commodity in excess of allotments.

Contracts accepted by the AAA as of Oct. 15, 1935, by commodities, totaled 7,198,441, including cotton, 3,258,997; corn-hogs, 1,912,520; wheat, 1,410,129; tobacco, 513,407; peanuts, 10,532; rice, 8274; and sugar (cane and beet), 84,582. The signers were organized in some 4200 county production control associations. In a series of six referenda, a total of 4,256,439 producers' votes were cast, with 86.8 per cent favoring continuation of the various programmes and measures.

Cotton. Three crops of cotton were produced in the United States under AAA adjustment programmes, and the AAA offered new contracts to cotton growers covering a four-year period beginning with the 1936 crop. The programmes removed from production about 10,500,000 acres in 1933, 14,600,000 in 1934, and 14,500,000 in 1935, and each reduced the world carry-over of American cotton. The average farm price rose from 6.5 cents per lb. in 1932-33 to 12.4 in 1934-35. Farm income from cotton and cotton seed, including rental and benefit payments, was estimated at \$839,000,000 in 1934-35 and \$862,000,000 in 1933-34, versus \$464,000,000 in 1932-33, the season preceding AAA crop adjustment. Indications were that figures for 1935-36 would show a still further increase, constituting the largest gross income from cotton and cotton seed since 1930. Rental and benefit payments to co-operating cotton growers totaled \$112,600,000 in 1933-34 and \$115,800,000 in 1934-35, and were expected to amount to probably \$125,000,000 in 1935-36. Operation of the Bankhead Act was continued for 1935-36 after results of a referendum to growers. See COTTON.

Wheat. Commencing in the crop year 1933, approximately 800,000 farm operators and landlords, organized in 1328 wheat-production-control associations, participated in efforts to apply the principle of cooperative action to adjustment of wheat production. Since 1933 the wheat surplus was reduced, prices in the United States maintained levels substantially above world prices, and the cash income received by wheat producers, including adjustment payments for the 1934 crop, was practically double the cash income for the 1932 crop. The farm value of the 1935 crop of 603,199,000 bushels was estimated at \$505,394,000 and payments under the various programmes at \$128,750,000. The wheat-allotment contract, approved in the summer of 1933, provided for a maximum downward adjustment of 20 per cent in seedings. Because of the drought of 1933 and 1934 and the rust epidemic of July, 1935, adjustments of such magnitude were not warranted, and consequently, required adjustments for the 1934, 1935, and 1936 crops were 15, 10, and 5 per cent, respectively; and furthermore, the requirements as to use of contracted or adjusted acreage were modified to offset in part the shortage of livestock feed due to drought. About 89 per cent of the wheat producers endorsed the principles of the wheat-adjustment programme in the referendum held May 25, 1935.

Tobacco. The AAA entered into adjustment contracts in 1934 with approximately 275,000 tobacco growers in continental United States and 10,500 growers in Puerto Rico, and covering about 88 per cent of the land usually in tobacco. The re-

sulting adjustment in tobacco production reduced the excess stocks on hand by about one-third. Income to producers from tobacco in 1934 more than doubled that of 1932, not including benefit payments. With benefit payments of \$43,136,000 included, the total income from the crop was \$266,315,000, compared with a 10-year average (1919-28) of \$270,602,000. The 1934 contracts were continued in 1935. Referenda by growers in 1935 favored a tax on the sale of tobacco for the crop year beginning May 1, 1935, as provided in the Kerr Tobacco Act, and favored the continuation of the programme. In the 1935 amendments to the Agricultural Adjustment Act, Congress fixed the processing taxes on tobacco at the rates then in effect but made provision for certain changes to correspond with changes in tobacco prices; and accordingly certain adjustments were made effective Oct. 1, 1935.

Sugar. The sugar programme made possible by the Jones-Costigan amendment to the Agricultural Adjustment Act sought to assure for domestic producers a fair share of the domestic market through a quota system, and to supplement the income of producers by benefit payments for their cooperation in adjusting production. During the year and a half that the sugar plan was in effect, surplus sugars in the continental United States and insular areas were eliminated. Adjustments in production were made in the domestic sugar areas as well as in the principal United States insular areas supplying sugar to this country. The principal curtailment of surplus was in the Philippine Islands. The income of producers generally was increased, and in localities of the United States sugar-beet area where the 1934 drought drastically reduced production, benefit payments under the sugar-beet programme were of unusual importance in maintaining farmers' income. These results were achieved without materially increasing the cost to consumers.

Income for approximately 70,000 producers co-operating in the sugar-beet programme, including benefit payments, amounted to nearly \$57,000,000. Louisiana producers signed approximately 9000 adjustment contracts, and their 1934 cash income was about \$16,000,000 versus \$11,000,000 in 1933. Sugar producers of Florida and sugar-cane sirup producers also derived benefits from the act under separate programmes. In the insular areas similar adjustment programmes were effected. Benefits to 19,000 Philippine growers for 1934-35 and 1935-36 adjustments approximated \$16,000,000, to 8000 Puerto Rico producers about \$12,000,000 on the 1934-35 crop; and in Hawaii adjustment payments about \$8,750,000 annually in a three-year programme. The insular areas also received benefits under the sugar-adjustment programmes by various expenditures for the benefit of agriculture out of special funds created under the Agricultural Adjustment Act for that purpose.

Rice and Rye. The AAA did not immediately launch a production-adjustment programme financed by processing taxes for rice, but instead it undertook in 1933 to adjust supplies and promote higher prices through marketing agreements. Due to greatly different conditions, the marketing agreement method proved better adapted to the California rice area than to the Southern (Arkansas, Louisiana, and Texas) area. In both areas the agreements helped to control production and raise prices to growers, but difficulties developing in the Southern area indicated that a production programme financed through processing taxes would

be more satisfactory. So in March, 1935, the AAA terminated the Southern marketing agreement. Under an amendment to the Agricultural Adjustment Act, it offered to growers a control programme based on a processing tax and benefit payments for 1935-36.

The 1935 amendments to the Agricultural Adjustment Act called for a production control programme for rye and provided for a processing tax of 30 cents a bushel to be effective from Sept. 1, 1935, until Dec. 31, 1937, unless modified as provided in the legislation. The rye programme developed late in the summer of 1935 was to run parallel with the new wheat contract.

Livestock, Corn-hogs, and Dairy Products. The reduced number of livestock on farms on Jan. 1, 1935, a direct result from the 1934 drought which tremendously reduced pasturage and grain and hay crops, would have been even smaller in 1935 had the AAA not acted in 1934 to prevent excessive liquidation, and to make the inevitable liquidation as orderly as possible. The 1934 and 1935 corn-hog adjustment programme had no appreciable effect on the much reduced 1934 fall and 1935 spring farrowings, the smallness of which primarily resulted from the drought.

Government action in 1934 and early in 1935 for the relief of the cattle industry was participated in by the AAA. More than 8,000,000 cattle were purchased and all animals fit for human use turned over to the Federal Surplus Relief Corporation. This mitigated the effects of the drought by increasing the supply of meat available for 1934, and the purchase programme reduced death losses on farms and ranches and enabled growers to save breeding stock. Due to the cattle-purchase programme, gross returns to cattlemen in 1934, including \$112,000,000 paid by the Government for drought cattle, were probably 75 per cent greater than they would have been otherwise.

In 1935 the AAA offered to farmers a corn-hog programme which restricted the planting of corn but not of other feed crops and it also made a supply of adapted seed available to producers in drought areas. Under the 1935 corn-hog contract, the individual farmer had to retire from corn production from 10 to 30 per cent of his base corn acreage. The benefit payment was 35 cents a bushel for the appraised corn yield. Signers retired in the aggregate 23 per cent of their base corn acreage, or nearly 12,000,000 acres, and about 93,000,000 acres of corn was harvested, compared with the 1928-32 average of nearly 103,000,000 acres. Without a corn-acreage limitation the 1935 corn crop would have created a burdensome surplus; adjustments held corn production more nearly in line with livestock needs.

Prices of dairy products were much higher in 1934 and 1935 than in 1932 and early in 1933. Demand conditions improved in 1933, marketing agreements and licenses under the Adjustment Act exerted a steadying influence, and government purchases of dairy products for relief distribution removed stocks from trade channels. A programme involving benefit payments for cooperative adjustments in dairy production, offered in April, 1934, was withdrawn, and the industry continued to rely on marketing agreements which dealt only with existing supplies of milk and milk products.

Other Activities. The consumers' counsel in the AAA continued to work for consumer protection and education. The counsel participated in the formulation of marketing agreements and basic commodity programmes, emphasizing in such work

the necessity of insuring a normal and adequate food supply for consumers.

Activities of the AAA in the several crop and livestock programmes noted above, drought relief, protection of consumers, and general and economic farm recovery, and its relations to foreign trade, farm imports and exports, farm income, land utilization, and soil conservation, and other related problems of American agriculture were treated in detail in *Report of the Secretary of Agriculture, 1935*; and *Agricultural Adjustment in 1934*; *A Report of Administration of the Agricultural Adjustment Act, February 15, 1934, to December 31, 1934*. See also *News Digest (A.A.A.)*; *Consumers' Guide, Land Policy Review*, and general and commodity informative material of the AAA (all U.S. Dept. of Agriculture).

Farm Credit Administration. The Farm Credit Administration, headed by Gov. William I. Myers, and institutions operating under its supervision, continued to provide a coordinated credit system for agriculture. The permanent institutions operating under its supervision included the Federal land banks, national farm loan associations, production credit corporations, production credit associations, Federal intermediate credit banks, and banks for cooperatives, including the Central Bank for Cooperatives. The regional agricultural credit corporations and emergency crop and feed loan offices, also under its jurisdiction, were expected to be of a relatively temporary character, established to meet a passing emergency. For earlier activities and details of organization see *THE NEW INTERNATIONAL YEAR BOOK* for 1933 (pp. 21-23) and 1934 (pp. 20-21).

The total of all loans from Farm Credit Administration institutions in 1935 aggregated \$1,070,000,000 compared to \$1,836,000,000 in 1934. Long-term real estate mortgage loans by the Federal land bank and commissioner amounted to \$440,000,000 compared to \$1,284,000,000 in 1934; short-term production loans, \$517,000,000 compared to \$446,000,000, and loans to farmers' business cooperatives \$113,000,000 compared to \$106,000,000.

Credit advanced to farmers and farmers' cooperative associations by the institutions in this group from May 1, 1933, through Dec. 31, 1934, totaled \$2,379,063,000, of which \$1,835,740,000 was loaned during 1934. Of the total advanced since May 1, 1933, about \$1,500,000,000 was farm mortgage loans, more than \$689,000,000 short-term production credit, and nearly \$195,000,000 advances to cooperative purchasing and marketing associations. Federal land banks made first mortgage loans on farm real estate aggregating \$870,506,000, and mortgage loans from the Land Bank Commissioner's fund, appropriated to supplement the Federal land bank refinancing programme, totaled \$623,948,000. Loans and discounts outstanding on Dec. 31, 1934, amounted to nearly \$3,000,000,000 as compared with approximately \$1,600,000,000 of outstanding balances for those institutions existing on Apr. 30, 1933, the last month-end prior to the establishment of the Federal credit administration. Of the amount outstanding on Dec. 31, 1934, \$2,513,240,000 represented farm mortgage loans, \$313,812,000 short-term production loans, and the remaining \$116,683,000 advances to farmers' cooperative associations.

Farmers borrowed \$210,000,000 of the total amount of short-term loans aggregating \$517,000,000 from the production credit associations; \$89,000,000 from regional agricultural credit corporations; \$122,000,000 from other institutions

discounting with the Federal intermediate credit banks; and \$96,000,000 from emergency crop and feed loan offices. The larger amount of short-term production credit extended during 1935 was attributed in part to the gradual expansion of the work of the cooperative production credit association. Production credit associations, numbering 560, doubled their volume of business in most sections of the country. The heavy demand for these loans indicated, according to Governor Myers, that the time is approaching when hundreds of millions of dollars of merchant credit and time purchases obtained by farmers each year will be shifted to cash financing through production credit associations, banks, and other institutions equipped to handle farmers' short-term needs on a business basis at a reasonable cost.

The Federal land banks and commissioner continued to be the main source of farm real estate mortgage loans during 1935; but most of their loans currently represented normal financing in contrast to the emergency demands of 1933-34. Federal land banks loaned on their account in 1935 approximately \$245,000,000, far below the volume loaned in 1934 under the emergency refinancing programme but much larger than the amount in 1933 or in any other year of the land banks' history. First and second mortgage loans by the land bank commissioner aggregated \$195,000,000 in 1935 against \$553,000,000 in 1934. The emergency refinancing of farm debts decreased rapidly with the improvement in farm conditions, yet the demand for real estate mortgage loans to finance the purchase of farms increased noticeably. The move toward farm ownership was encouraged considerably by provisions of the Farm Credit Act of 1935 that commissioner's loans, used hitherto for refinancing, could also be made to finance the purchase of farms in amounts up to 75 per cent of the value.

A substantial part of the outstanding bonds of the Federal land banks was refunded during 1935 at lower rates, and accompanying this, the contract interest rate on new loans through national farm loan associations was dropped gradually from 5 to 4 per cent per annum—the all-time low point. As a result, many farmers shifted their mortgages to the land banks. Approximately \$625,000,000 of bonds of the Federal land banks bearing from 4 to 5 per cent interest had been refunded since mid-1934 at rates ranging from 3 to 4 per cent. Part of a \$100,000,000 issue of December 10, 1935, was being used for new loans, thus marking the return of land banks to the investment market after a five-year period, and the discontinuance of use of Government-guaranteed bonds of the Federal Farm Mortgage Corporation which were exchanged for land bank bonds for about a year and a half. The land banks expected in the future to continue to draw funds for new financing from the investment market. The remaining purpose of the Federal Farm Mortgage Corporation was to provide funds for commissioner's loans and to collect loans outstanding. Of the total bond authorization of the corporation, amounting to \$2,000,000,000, an amount aggregating \$1,387,000,000 was outstanding on Nov. 30, 1935. Farm real estate sales by the Federal land banks during 10 months of 1935, including over 6400 farms and over 1000 parts of farms, amounted to \$22,154,000, compared to \$17,600,000 for the entire year 1934 and \$14,113,000 in 1933, respectively. Farm real estate held by the banks on Oct. 31, 1935, amounted to \$95,816,000.

Farm loan collections were headed toward normal conditions during 1935. Interest collections on

Federal land bank loans for the first 11 months of the year aggregated over \$61,000,000, which was about 90 per cent of the \$68,000,000 of interest maturing during the period, compared with collections of \$50,000,000 interest in corresponding months of 1934 or 87 per cent of the amount maturing.

More of the credit business of farmers' cooperative marketing and purchasing organizations was done in 1935 by the 13 banks for cooperatives, which loaned around \$66,000,000 versus \$40,000,000 in 1934. Farmers' business cooperatives in 1935 also borrowed \$44,000,000 from the Federal intermediate credit banks on the security of warehouse receipts, which slightly exceeded the amount in 1934. Loans and discounts of the Federal intermediate credit banks for production credit associations, regional agricultural credit corporations, and other financing institutions approached \$350,000,000.

The Farm Credit Act of 1935, signed by President Roosevelt on June 3, 1935, reduced the interest rate on Federal land bank loans. Effective for one year beginning July 1, 1935, interest payable on all Federal land bank loans made through national farm loan associations will be charged at the reduced rate of $3\frac{1}{2}$ per cent as provided in the act. Interest payable in the two years beginning July 1, 1936, will be reduced to 4 per cent; after this period the rate will be that stipulated in the original loan contracts. The act also enabled the land bank commissioner to make first and second mortgage loans to farmers to finance the purchase of farms. The act also broadened services offered by the banks for cooperatives by reducing interest charged on loans secured by commodities, by permitting the rediscounting of such loans with the Federal intermediate credit banks, and by allowing the banks to make loans on security of physical facilities to farmers' cooperative associations engaged in purchasing farm supplies. Cooperatives supplying farmers with various business services were now eligible to borrow from the banks as well as those engaged in marketing farm commodities or purchasing farm supplies.

Credit Unions. The Federal Credit Union Act of 1934 designated the Farm Credit Administration to charter and supervise unions organized under the Act, but not to provide them with capital or loanable funds. C. R. Orchard, director of the Credit Union section, reported that 826 Federal charters for these cooperative thrift and loan associations were granted during 1935, and nearly 600 additional credit unions were chartered under State laws—a total surpassing all previous records. Small groups of factory and office employees and community groups have organized altogether 904 Federal credit unions in addition to approximately 3000 now operating under State charters. Federal credit union activity brought new life to the 25-year-old credit union movement in the United States. About 100,000 men and women, members of the new Federal credit unions, saved over \$2,000,000 during 1935, and all-told Federal and State credit unions comprised about 800,000 members with savings of more than \$50,000,000.

Senator McNary, et al (U.S. Senate Rpt. 1456 (1935), 74th Congress, 1st session).

World Agriculture. Some of the activities and movements in foreign countries either affecting or which might affect American agriculture in its world trade relations in some way included the British hog and bacon marketing plan, and beef and milk products import restriction programmes; the French wheat law of Dec. 24, 1934, and other changes in wheat legislation, and agricultural credit conditions in France; the treatment of agriculture in the reciprocal trade agreement concluded with Sweden; the agricultural credit situation in Italy; the German food situation; the increase in pork production and trade in Czechoslovakia; U.S.S.R. harvesting and procurement measures, and the abolition of the bread card system in the Soviet Union; the progress of cotton production in China; dairying in Argentina, and improvement in the quality of Argentine wheat; and agriculture in the Canadian trade agreement, the expansion of agricultural marketing control in Canada, and the new Canadian wheat law. The foregoing activities and factors; the wheat and flour situation in China and Manchuria; the soybean situation in Manchuria; agricultural conditions in the Soviet Union; the cotton situation in India; bread-grain consumption and trade in the British Isles, France, Germany, Hungary, Italy, Poland and Finland, and Switzerland; the Hungarian hog and pork industry; Mediterranean olive oil production; cotton versus coffee in Brazil; the world situation in feed grains, cattle and beef, hogs and pork, and sugar; agriculture in the foreign trade of the United States; United States trade with Cuba in lard and cottonseed oil; United States balance of international payments; United States imports of competitive agricultural products; United States agricultural and industrial exports; index numbers and trends in value of United States agricultural exports and United States trade with the territories were discussed in detail during the year in *Foreign Crops and Markets* and in other publications of the U.S. Department of Agriculture. See the respective countries under *Agriculture or Production*.

Bibliography. Publications in 1935 or late in 1934 which dealt with agricultural problems of current interest included

AGRICULTURE, U.S. DEPARTMENT OF The Department of Agriculture during the fiscal year ended June 30, 1935, continued vigorously the pursuit of its regular work as well as its emergency activities. Scientific research, the principal function of the Department, was carried on to give expression to further results in the solution of farm and home problems and the emergency work was pursued, aside from its mandatory aspects, with a view to arriving at a permanent yet flexible agricultural adjustment and to bringing the farm into economic harmony with other industries in the production and use of our national wealth. In his annual report the Secretary of Agriculture, in addition to reviewing the regular activities engaging the Department, dealt with farm recovery in

relation to general recovery, foreign trade, farm income, agricultural credit, farm land values, land use, soil conservation and allied subjects in their bearing on this general problem.

Important changes in the organization of the Department included the establishment as a separate agency of the Office of Personnel theretofore a part of the former Office of Personnel and Business Administration, the organization at the close of the year of two new units, a Vitamin Division and a Pharmacological Division in the Food and Drug Administration, and since the close of the fiscal year a reorganization of the Forest Service by consolidating the eight former branches into four major groups covering national forest administration, state and private forestry cooperation, operation and information, and research. On Mar. 25, 1935, the Soil Conservation Service was transferred from the Department of the Interior to the Department of Agriculture. The Resettlement Administration was placed under the direction of Under Secretary of Agriculture Rexford G. Tugwell.

On June 30, 1935, the Department had under appointment 44,080 persons or 5457 more than at the close of the preceding fiscal year. The force of the Agricultural Adjustment Administration was increased during the year from 5152 to 6136 employees and the Soil Conservation Service which transferred 1272 employees from the Department of the Interior increased this number by the close of the year to 1853. On June 1, 1935, 1670 employees of the Agricultural Adjustment Administration were transferred to the Resettlement Administration. The largest number of employees in the Department during the World War period was 25,239 on July 1, 1918. The number of appointments during the fiscal year 1935 was 29,092 and the number of separations from the service 23,635 as compared with 31,434 appointments and 19,355 separations in 1934.

Changes in personnel during the fiscal year and since its close included the appointment of P. V. Cardon, Director of the Utah Agricultural Experiment Station, to succeed A. J. Pieters, at the age of retirement, in charge of forage crop investigations and of Ira N. Gabrielson, consulting specialist and Assistant Chief of the Division of Wildlife Research, to succeed as Chief of the Bureau of Biological Survey Jay N. Darling who relinquished this position on Nov. 15, 1935, to resume his work as a cartoonist. L. H. Dewey, botanist in charge of investigation of flax as a fibre crop reached the age of retirement during the year. Robert M. Chapin was made Chief of the Biochemic Division of the Bureau of Animal Industry as successor to Marion Dorset who died July 14, 1935. J. A. Emery Assistant Chief and later Acting Chief of the Biochemic Division died July 28, 1935. Charles E. Kellogg was appointed Chief of the Soil Survey Division of the Bureau of Chemistry and Soils to fill the vacancy caused by the death of Curtis F. Marbut on Aug. 25, 1935. Since the close of the fiscal year Seth Thomas resigned as Solicitor of the Department and Mastin G. White was appointed as his successor. William F. Callander in charge of the Division of Crop and Livestock Estimates of the Bureau of Agricultural Economics was made Assistant Administrator of the Agricultural Adjustment Administration and Joseph A. Becker was appointed to fill the vacancy created by the transfer. M. D. Waite in charge of Fruit Disease Investigations, C. L. Shear, head of the Division of Mycology and Disease Survey, Wil-

liam Stuart in charge of Potato Investigations, E. C. Shorey at the head of Biochemical Investigations of Soils and Fertilizers and David Fairchild, agricultural explorer, were retired during the year. A. S. Hitchcock, head of Grass Investigations, died Dec. 16, 1935.

The regular appropriations of the Department for the fiscal year 1935 amounted to \$75,332,563. In addition about \$120,000,000 of the 1936 road fund authorizations were obligated in 1935 as provided by law. The emergency appropriations and allocations including balances brought forward from prior years were as follows: Road funds \$413,684,741, Agricultural Adjustment Administration \$1,014,645,969, National Industrial Recovery Act \$28,545,415, Emergency Appropriation Act, 1935, \$23,748,536, Emergency Relief Appropriation Act of 1935, \$43,650,000 and Puerto Rico and Hawaii trust funds \$2,568,000, a total of \$1,602,175,224, of regular and emergency appropriations.

AIRSHIPS. See AERONAUTICS.

AKRON, THE UNIVERSITY OF. A coeducational institution of higher learning in Akron, Ohio, founded in 1870 as Buchtel College and taken over by the city and renamed in 1914. There were enrolled in the summer session of 1935, 316 students. For the autumn day session the enrollment was 1383 and for the autumn evening session, 1137. The faculty numbered 90. In 1935, there was a change in the organization of the University as it affects the classification and grouping of students. All of the work of the first two years is given in a unit called the General College. For promotion to the Upper College a quality requirement is imposed. The endowment amounted to \$149,341, while the income for the year, including tax levy from the city, was \$256,749. The library contained 41,157 volumes. President, Hezleton E. Simmons, Sc.D.

ALABAMA. Population. On Apr. 1, 1930 (Fifteenth Census), 2,646,248; July 1, 1934, by latest Federal estimate, 2,710,000; 1920 (Census), 2,348,174. Montgomery, the capital, had (1930) 66,079 inhabitants; Birmingham, 259,678.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu	Value
Cotton	1915	2,240,000	1,060,000*	\$56,233,000
	1934	2,133,000	950,000*	57,453,000
	1935	3,391,000	44,761,000	31,333,000
Corn	1934	3,425,000	47,950,000	37,880,000
	1935	603,000	391,000*	4,496,000
Hay (tame)	1934	602,000	394,000*	4,925,000
	1935	449,000	314,300,000*	8,800,000
Peanuts	1934	443,000	265,800,000*	7,708,000
	1935	75,000	6,900,000	4,830,000
Sweet potatoes ..	1934	81,000	7,614,000	6,472,000
	1935	38,000	3,230,000	2,261,000
Potatoes	1934	40,000	3,760,000	3,083,000

* Bales. † Tons. ° Pounds.

Mineral Production. Coal mines in the State produced 9,596,000 net tons in 1934, thus surpassing by 9.5 per cent the production of 1933, which had totaled 8,759,989 tons according to revised figures. This proportionate gain for Alabama exceeded the corresponding rise for the entire union, which came to 7.4 per cent. The proportion of Alabama's mined coal used to make coke rose to nearly one-third, from about one-fourth for 1933, and thus accounted for virtually all the increase in 1934's production of coal. The by-product ovens produced

2,109,192 net tons of coke in 1934, as against 1,668,975 in 1933; by value, \$6,508,933 (1934), as against \$3,885,858 (1933).

The iron mines produced 2,343,819 gross tons of ore in 1934, which exceeded by 10 per cent the total for 1933. The production of pig iron rose again, to 1,171,650 gross tons for 1934, from 900,170 for 1933. The blast furnaces' shipments of pig iron, 1,144,900 gross tons for 1934 and 987,606 for 1933, attained the respective values of \$15,805,365 (1934) and \$11,385,090 (1933).

There occurred a small but sharp rise in the mining of gold, to a production of 2781 fine ounces (1934), from a mere 4 ounces in 1933. This was mainly due to the operation of an old working, the Hog Mountain mine in Tallapoosa County, with a new flotation mill.

Education. The legislative session of 1935 passed laws adding some \$3,000,000 to the usual total appropriation of State money for aid to public schools, but it omitted to create all the requisite new revenue, leaving this to a later special session.

Legislation. In order to meet the opportunity offered by the Federal Social Security Act, there was enacted a State system of insurance against unemployment. The question whether to repeal the State's prohibition of alcoholic beverages was submitted to a public referendum held on February 26. A bill for the sterilization of the insane, habitual criminals, and degenerates was passed but was vetoed by Governor Graves, who had secured from the State Supreme Court an advisory opinion that the measure violated the Federal and State constitutions. In order to admit Negroes to the jury lists, in conformity with the ruling of the Federal Supreme Court, an act was passed authorizing jury boards to refill jury boxes immediately.

Political and Other Events. The referendum held on February 26 rejected the proposal to repeal State prohibition. Although Birmingham, Montgomery, and Mobile gave heavy majorities for repeal, the rural vote in favor of retention prevailed.

Two of the seven Negro youths who had been held for retrial according to an earlier order of the Federal Supreme Court were reconvicted and under a State Court's sentence of death for rape at the beginning of the year. The Federal Supreme Court ruled again, in the matter of one of them, on January 7, holding that Negroes had been omitted from jury duty and that consequently the defendant had not had the full equal protection of the law. Further proceedings in the cases awaited the inclusion of the names of Negroes in the boxes from which the names of jurors were drawn. Governor Graves obtained legislation and action on the courts' part designed to make such inclusion universal. The prosecutions were then begun anew. For this purpose a new grand jury was drawn in Jackson County, from a list that included names of Negro citizens. One Negro sat on this grand jury. It found indictments, on November 13, against nine youths accused in the Scottsboro case, charging them with criminal assault on two counts—one as to Mrs. Victoria Price and the other as to Ruby Bates, a former accusing witness who had later recanted her accusation in court and had disappeared.

The State's coal-mining industry was disturbed by the new regulation of wages and hours of work under the Federal Guffey Act; it was asserted that the industry was in peril of ruin through failure to obtain a "differential" allowing a sufficiently lower scale of pay, as against Northern mines.

Officers. The chief officers of the State, serv-

ing in 1935, were: Governor, Bibb Graves; Lieutenant-Governor, Thomas E. Knight, Jr.; Secretary of State, Howell Turner; Treasurer, John Brandon; Auditor, Charles E. McCall; State Superintendent of Education, J. A. Keller.

Judiciary. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, Thomas E. Knight, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, Joel B. Brown.

ALABAMA, UNIVERSITY OF. A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1935 the enrollment was 4700; the summer school registration was 2287. The faculty for 1935-36 numbered 275. The productive funds of the university amounted to \$4,389,301, and the income for the year was \$1,123,904. The library contained about 150,000 volumes, of which 20,000 were government documents. President, George H. Denny, Ph.D.

ALASKA. A territory of the United States. Its area is 586,400 square miles; its capital is Juneau. Alaska's population in 1930 was 59,278 (Fifteenth Census); in 1920, 55,036. In 1930 the white population of 28,640 was outnumbered by 29,983 Indians and Eskimos.

Topography. An expedition of the National Geographic Society traveled across the St. Elias Range from a point West of Carcross in the Yukon Territory, charted the course of the Alsek River, and surveyed surrounding mountains. Data on some 2000 square miles of surface said to have previously been unmapped were obtained.

Colonization. The Federal Emergency Relief Administration gathered some 200 families of destitute farming people, chiefly from Michigan, Wisconsin, and Minnesota, and transported them to Alaska early in the season of navigation. Most of them were taken into the Matanuska Valley area, to settle a projected farming community, with the coöperation of the Rural Rehabilitation Corporation of Alaska. They were sheltered in tents, to await the construction of houses, which Federal agencies undertook to have ready for them before winter. Some of the colonists appealed in June to U. S. Senator Couzens, complaining of delay and mismanagement in providing for their needs. Some of their grievances were remedied on July 1 by an inspecting agent of the FERA.

Roads and Transportation. An act of Congress authorized the President to negotiate with the Dominion of Canada for an agreement to provide the construction of an automobile highway from the United States to Fairbanks, Alaska. A commission created by Congress in 1930 had studied the feasibility of the undertaking and had reported favorably.

The Alaska Railroad and its subsidiary lines of boats obtained in 1934 a total revenue of \$1,476,568; it came chiefly from the hauling, by rail, of 109,214 tons of freight, which paid \$1,091,446—some \$10 a ton; 73,060 tons of this freight were coal. It cost \$1,557,563 to operate and maintain the lines; this exceeded revenue by nearly 6 per cent and gave no return on capital.

Some 1898 miles of vehicular roads built by the Alaska Road Commission (part of the Department of the Interior, but administered by the Governor of Alaska) and mainly maintained by the Commission took care of much of the transportation. These roads and a great mileage of trails and some tramway lines had cost, to June 30, 1935, \$21,543,493, chiefly derived from Federal appropriations, but partly from Territorial contribution. The Territory maintained another 200 miles of roads of its own.

The Bureau of Public Roads (Department of Agriculture), in addition maintained a system of roads in the National forests of Alaska. Aeroplanes played an increasing part in transportation, flying 1,685,654 miles in 1935.

Finance. The government of the Territory reported, for the calendar year 1934, receipts of \$1,935,184, disbursements of \$1,800,310, and a remaining balance at the end of the year, of \$516,398. Its receipts included Federal grants for relief of the needy and for aid to schools. The latter came out of the Alaska Fund, a Federal special fund deriving its income from Federal charges for trade and business licenses in the Territory.

Banking and Commerce. The Territorial banks held on June 30, 1935, deposits totaling \$7,440,597; National banks, of \$4,521,683. The external commerce of Alaska with the United States was reported, for the year ended with June 30, 1935, to have exceeded by \$14,520,054 (approximately) that for the year previous; Alaska's favorable balance in this yearly trade reportedly rose to \$29,872,022, from \$18,262,968. An increasing number of tourists, visiting Alaska in 1935, tended to augment business in the Territory.

Fisheries and Sealing. A strike among employees in the salmon-fishing industry somewhat limited the production for 1935, for which the totals were not yet collated. For 1934, the total value of all commercial fish and of whales, taken in Alaskan waters, was \$41,963,293, of which canned salmon furnished \$37,611,950. The Federal Government got from the Pribilof Islands, in 1934, 53,468 skins of fur seals, and there were left 1,430,418 living seals (computed), or 111,850 more than the year before. The Government's sales of Pribilof seal-skins for the year following the kill of 1934 brought in over \$1,000,000.

Mineral Production. The devaluation of the U. S. dollar had the effect in 1934 of rendering Alaska's mineral industry more nearly than in a generation a matter of gold mining. Somewhat fewer ounces of gold were mined in 1934 than in 1933—457,345 as against 469,286; yet the respective yearly total value of the product rose, by reason of an enhanced price, to \$16,007,000 (1934), from \$9,701,000 (1933). The value of the yearly output of gold, as recently as 1927 inferior to that of copper, constituted for 1934, at \$35 an ounce, nearly 96 per cent of the value of all minerals produced in the year. Coal, yielding 107,500 tons, in value \$451,500, ranked second.

Reindeer Husbandry. Gov. John W. Troy in his annual report for 1935 said: "It is evident that reindeer are not as numerous as has been believed." He cited a survey indicating the number of reindeer on ranges to be some 550,000. Native cooperative associations (of Eskimos or Indians), 26 in number, having 3255 "shareholders," had outstanding 286,596 shares of "stock," each share being one putative reindeer; the average shareholder thus owned 88 "shares" and consumed annually nearly 8 of them as dividends. It was recommended that the ownership of reindeer by others than aborigines be gradually brought to an end.

Education. The Territorial Legislature accepted from the Federal Government an offer of \$15,000 a year for spreading vocational education, and it appropriated an equal amount. The Territorial public schools were maintained to the extent of between 70 and 80 per cent of their cost by Territorial grants and by part of the proceeds of the Alaska Fund. Those in organized school districts derived other maintenance through local taxation.

Accredited high schools operated in 10 communities. The Federal Office of Indian affairs maintained, in 1935, 99 schools for members of the native races; these schools had 4299 enrolled pupils and 186 teachers.

ALBANIA, āl-bā'nī-ā. The smallest of the Balkan States, with an area of 10,629 square miles and a population estimated at 1,050,000 on Jan. 1, 1934 (1,003,124 at the 1930 census). Capital, Tirana (30,806 inhabitants in 1930). The other principal towns are Shkoder (Scutari), 29,209; Korçe (Koritsa), 22,787. Reigning sovereign in 1935, King Zog I, who assumed the throne Sept. 1, 1928.

Production. The people are engaged mainly in agriculture and cattle raising. Tobacco, wool, hides, timber, furs, dairy products, fish, olive oil, and corn are the chief products. Yields of the chief crops in 1933 were (in metric tons): Wheat, 64,800; rye, 4600; barley, 8900; oats, 14,300; corn, 111,800; olives, 25,600; and tobacco, 1090. The 1932 wool clip was about 2000 metric tons. Some salt, copper, and bitumen are produced, but the forest and mineral resources remain largely undeveloped. The chief industries are flour milling, cheese making, and olive pressing. An oil field near Berat was under development by the Italian State Railways. A pipeline from the fields to Valona (Vlore) was nearing completion in 1935.

Foreign Trade. Total imports in 1933 were valued at 15,938,000 gold francs (22,815,000 in 1932) and exports were 5,746,000 gold francs (4,500,000 in 1932). Italy, the United Kingdom, Czechoslovakia and the United States were the principal sources of imports, while exports went mainly to Italy and the United States.

Finance. Budget estimates for the fiscal year ended Mar. 31, 1935, placed receipts at 18,888,000 gold francs and expenditures at 18,507,000 gold francs, compared with final comparative returns for 1933-34 of about 22,200,000 and 21,100,000 gold francs, respectively. The foreign public debt on Mar. 31, 1932, totaled 68,200,000 gold francs. Albania borrowed 50,000,000 gold francs from Italy in 1925 and in 1931 agreed to accept a subsidy to a maximum amount of 10,000,000 gold francs annually for ten years, giving Italy certain political and economic concessions in return. The gold franc was equivalent to \$0.193 in old U. S. gold dollars of 1.50463 grams.

Communications. Albania in 1934 had 1120 miles of highways suitable for motor traffic, a railway line 22 miles long from Tirana to the port of Durres (Durazzo), and seven air routes linking Tirana with Rome and with various Balkan cities. Inauguration of bus service between Korçe, Albania, and Bitolj, Yugoslavia, in 1935 gave central and southern Albania a shorter means of transportation and communication with central and western Europe.

Government. Under the Constitution of 1928, executive power is vested in the King and a council of ministers appointed by him. There is a legislative assembly of 58 members elected indirectly.

History. The close political cooperation between the Albanian and Italian Governments, interrupted during 1933 and 1934 by nationalistic and anti-Italian legislation and agitation in Albania (see NEW INTERNATIONAL YEAR BOOK for those years), was resumed in 1935. The inclusion of Albania in the scheme for Italo-Yugoslav rapprochement inaugurated early in 1935 (see ITALY and FRANCE under *History*) and the financial difficulties of King Zog's government contributed to this development. On Sept. 7, 1935, Rome officials

announced that Italy would resume her yearly loans of 10,000,000 gold francs, called for in the Albanian-Italian agreement of 1931 but withheld in 1933-34 in order to bring pressure upon King Zog. The development of Italian political and economic interests in Albania was further encouraged by a grant of 60,000,000 lire advanced by the Italian Government to an Italian company organized for the economic exploitation of Albania. On October 16, coincident with his acceptance of the Evangheli Cabinet's resignation, King Zog announced to the National Assembly that Albania could not join the other League members in applying economic sanctions against Italy, her close friend and ally. A new cabinet was formed October 21 under Mehdi Frasherî.

Resentment at King Zog's subservience to Italy was believed the chief motive for the revolution which broke out at Fieri in southern Albania on August 15. The movement started with the assassination near Valona of Gen. Leon de Ghilardi, Inspector-General of the Army and King Zog's right-hand man, whose rôle of chief intermediary between Rome and Tirana made him both hated and feared by Albanian nationalists. The extent of the uprising was veiled by the strict Albanian censorship, but reports stated that 60 were killed in the fighting and 300 prisoners were taken before the revolt was crushed. Of several hundred conspirators tried by court martial, 16 were executed and nearly 50 others were sentenced to death. Through the intervention of foreign diplomats, the King on September 22 commuted the death sentence of those awaiting execution, with one exception, and ordered the rebels imprisoned for varying terms.

In 1934 the Greek Government had appealed to the League of Nations, protesting the action of the Tirana Government in refusing to permit persons recruited in Greece to teach in the Greek minority schools in Albania. This was held to be a violation of the Albanian Declaration of Oct. 2, 1921, guaranteeing minorities in Albania the right to maintain and control schools at their own expense. The issue, submitted by the League Council to the World Court for an advisory opinion, was decided on Apr. 6, 1935, when the court ruled against Albania.

ALBERTA, *âl-bûr'ta* A province of Western Canada Area, 255,285 sq. miles; population, 770,000 (1934 estimate) compared with 588,454 (1931 census). Chief cities: Calgary (83,761 inhabitants in 1931), Edmonton, the capital (79,197), Lethbridge (13,489), Medicine Hat (10,300). During 1934 there were 16,163 births, 5322 deaths, and 6053 marriages.

Production. The preliminary estimated value of field crops for 1935 was \$99,562,000 (\$111,381,000 for 1934) of which wheat (105,200,000 bu.) represented \$63,120,000; oats (94,611,000 bu.), \$16,084,000; barley (18,860,000 bu.), \$3,961,000; grain hay, \$8,844,000; hay and clover (465,600 tons), \$2,952,000; potatoes (95,300 tons), \$1,296,000; alfalfa (169,000 tons), \$1,489,000; sugar beets (136,000 tons), \$782,000. In 1934 the province had 1,570,200 cattle, 896,100 swine, 698,300 horses, and 696,200 sheep. Mineral production (1934) was valued at \$20,228,851 including coal (4,753,810 short tons), \$12,556,099; natural gas (14,841,491 M cu. ft.), \$3,707,276; petroleum (1,253,966 barrels), \$3,104,823. Mineral production (1935): coal (5,680,025 short tons) valued at \$14,817,584; natural gas (14,933,300 M cu. ft.). Fur production (1933-34) 2,270,491 pelts valued at \$1,533,799 of which

silver fox (11,993 pelts) represented \$337,003, muskrat (544,808 pelts), \$326,885. During 1933 there were 975 factories, with 10,994 workers, from which the value of products was \$54,642,706 gross and \$25,137,551 net.

Government. For the year ended Mar. 31, 1935, revenue totaled \$15,697,770; expenditure, \$17,435,821; public debt, \$146,048,010; sinking funds, \$9,925,223. Government was vested in a lieutenant-governor aided by an executive council, and a legislative council of 63 members (56 Social Credit, 5 Liberal, and 2 Conservative, elected on Aug. 22, 1935). Alberta was represented in the Dominion Parliament at Ottawa by 6 members in the Senate and 17 members (15 Social Credit, 1 Conservative, and 1 Liberal elected at the general election of Oct. 14, 1935) in the House of Commons. Lieutenant-Governor in 1935, W. L. Walsh; Premier, William Aberhart (Social Credit). See CANADA under *History*.

History. During December, 1936, 16 men were killed by an explosion which occurred in the Lethbridge Collieries Mine at Coalhurst, Alberta.

ALEXANDRIA. See ARCHÆOLOGY.

ALFALFA. The season of 1935 was much more favorable for the production of alfalfa hay than the season of 1934 and this was reflected in a larger acreage and a greater yield. The Department of Agriculture estimated the yield of alfalfa hay at 29,066,000 tons as compared with 19,042,000 tons in 1934 and 23,668,000 tons, the average production for the five years 1928-32. The 1935 acreage of 13,567,000 acres was 2,085,000 acres above the acreage of 1934 and 1,911,000 acres above the five-year average. The average per acre was 2.14 tons while in 1934 it was only 1.59 tons. The leading States reported the following yields: California 2,713,000 tons, Nebraska 2,331,000 tons, Wisconsin 2,111,000 tons, Minnesota 2,093,000 tons, Michigan 1,929,000 tons and Idaho 1,915,000 tons. The highest average yield per acre, 3.8 tons, was reported by California and the largest acreage, 1,260,000 acres, by Nebraska. Alfalfa hay production was reported by all States except Florida.

The alfalfa seed production was practically equal to the average for the five years 1928-32 but was 29 per cent below the record crop of 1930. The 1935 yield was 822,900 bu., as compared with 820,700 bu. produced in 1934. The average yield per acre was 2.29 bu., the average farm price based on preliminary estimates \$8.13 per bushel and the total value of the crop on this basis \$6,694,000. In 1934 the average farm price per bu. was \$10.27 and the total crop value \$8,430,000. Among the 21 States reporting production the leading States and their yields were as follows: Kansas 144,000 bu., Nebraska 104,000 bu., Idaho 93,600 bu., Arizona 88,200 bu., and Utah 59,400 bu.

During the fiscal year ended June 30, 1935, 123,500 lb. of alfalfa seed was imported, practically all from Canada, and 477,000 lb. were exported. The alfalfa meal production for the year ended May 31, 1935, was 186,108 short tons. The duty on alfalfa hay during the year was \$5 a short ton and on alfalfa meal 20 per cent ad valorem. The United States Department of Agriculture continued during the year the development of strains resistant to cold and to bacterial wilt.

ALFALFA INSECTS. See ENTOMOLOGY, ECONOMIC.

ALGERIA. A French colony in North Africa, with an area of 847,870 square miles (of which 625,664 square miles are desert) and a population estimated in 1934 at 6,910,000 (6,553,451 at the

1931 census). The total European population in 1931 was 920,788, including 762,852 French. Populations of the chief towns in 1931 were: Algiers (Alger), the capital, 257,122; Oran, 163,743; Constantine, 104,902; Bône, 68,778. The native population is Moslem, the numerous Jews in the towns being regarded as French citizens. There were 228,482 pupils in primary and secondary schools in 1933 and 2622 students in the university at Algiers.

Production. About 15,172,000 acres are under cultivation while the area of meadows and pasture is 11,522,000 acres. At the end of 1933 livestock numbered 896,000 cattle, 5,262,000 sheep, 2,654,000 goats, 66,000 swine, 168,000 horses, 507,000 mules and asses, and 169,000 camels. Production of the chief crops in 1934 was: Wheat, 43,528,000 bu.; barley, 44,755,000 bu.; oats, 11,889,000 bu.; potatoes, 3,898,000 bu.; wine, 582,306,000 gal.; olive oil (1934-35), 3,980,000 gal.; tobacco, 35,274,000 lb.; dates, 228,753,000 lb. Mineral production in 1934 was (in metric tons): Phosphates, 532,210 (587,753 in 1933); iron ore, 1,327,000 (761,000); coal, 34,000 (30,000); zinc ore, 4000 (5084); petroleum, 560 in 1933; iron pyrites, 16,127 in 1933.

Foreign Trade. Imports in 1934 were valued at 3,973,300,000 francs (4,071,700,000 francs in 1933) and exports at 3,442,500,000 francs (3,817,200,000 francs in 1933). France supplied 82.5 per cent of the 1933 imports and purchased 89.8 per cent of the total exports by value. Algeria in 1934 remained France's most important customer and source of supply, purchasing 17.2 per cent of all French exports and supplying 12.1 per cent of France's imports by value. Cotton fabrics, chemicals, metal manufactures, machinery, iron manufactures, and sugar were the principal imports. The value of the leading 1933 exports was (in 1000 gold dollars): Wine, 93,025; wheat, 10,779; sheep, 3476; spirits, 3298; fruits and nuts (other than dates), 2934; groats, 2322.

Finance. Budget estimates for 1935 placed receipts at 1,872,425,120 francs and expenditures at 1,871,722,943 francs. The public debt on Jan. 1, 1931, was 1,094,000,000 francs. On Oct. 25, 1935, the government issued 600,000,000 francs of 5 per cent bonds, amortizable in 20 years.

Communications. Algeria in 1934 had 3005 miles of railway lines. In 1933 railway receipts totaled 252,040,000 francs. There were 12,220 miles of main highways and 18,217 miles of secondary roads. An air mail service linked Algiers and Marseille. The net tonnage of overseas vessels entering the ports with cargo in 1934 was 8,482,000 (8,241,000 in 1933); tonnage cleared, 8,603,000 (7,792,000 in 1933).

Government. Northern Algeria is divided administratively into the departments of Algiers, Oran, and Constantine, which are considered constituent departments of France and are each represented in the National Assembly at Paris by three deputies and one senator. Administration is centralized in the hands of the Governor-General, with the exception of the non-Moslem services. Southern Algeria is under military government. Governor-General in 1935, M. Jules Carde, appointed Oct. 3, 1930.

History. The political unrest in Algeria, aggravated by adverse economic conditions, fanned a brawl between native soldiers and the police into a serious riot at the town of Setif on Feb. 1, 1935. A number of Jewish shops were looted and the local police station was attacked before loyal troops ended the disorders.

ALLEGHENY COLLEGE. A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1935 was 657, and for the summer session 135. The faculty numbered 46 members. The productive funds of the college amounted to \$1,500,000, and the income for the year 1934-35 was \$448,810. The Reis Library contained 107,000 volumes. President, William P. Tolley, Ph.D., D.D., LL.D.

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of clubs and groups, formed in 1902 for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. By 1935 it comprised more than 290 local branches, including alliances, affiliated societies, and clubs in universities, colleges, and schools.

Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. The official lecturer for the season 1934-35 was Marcel Aubert, curator at the Musée du Louvre and professor at the École des Beaux Arts in Paris. The Federation also organizes lecture tours for distinguished French travelers and French lecturers who live in America, assists in organizing courses in the French language and literature in cooperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. Its Assemblée Générale, attended by representatives of the various groups, was held in New York City, Apr. 27, 1935. The official periodical is *L'Écho de la Fédération*.

The officers in 1935 were: President, Frank D. Pavey; general vice-president, William Nelson Cromwell; president of the executive committee, Albert Blum; treasurer, John F. Daniell, general secretary, Roger Sherman. Headquarters are at 26 Liberty Street, New York City.

ALSACE-LORRAINE. The provinces transferred to France by the Versailles Treaty (June 28, 1919) to date from the Armistice of Nov. 11, 1918, and now known as the departments of Bas-Rhin (1848 sq. m.; pop., 688,242 in 1931), Haut-Rhin (1354 sq. m.; pop., 516,726), and Moselle (2403 sq. m.; pop., 693,408). Total area, 5606 sq. miles; total population (1931), 1,898,376. The departments were rich in iron, potash, and petroleum.

ALUMINUM. Canadian production of aluminum in 1935 reached 59,958,200 lb., according to the Dominion Bureau of Statistics. This was the highest output since the record production of nearly 73,000,000 lb. in 1929. More than half of the total production, 33,720,400 lb., was consumed in the United Kingdom. Of the remainder, 12,165,600 lb. was exported to Japan, 5,010,100 lb. to the United States, 4,772,800 lb. to Switzerland, and 1,052,700 lb. to Australia.

New aluminum produced in the United States during 1935 amounted to 119,295,000 lb., valued at \$22,070,000, compared with 74,177,000 lb., valued at \$14,094,000, in 1934, according to an advance report issued by the U.S. Bureau of Mines. The principal producing plant was that at Massena, N. Y., where approximately 50 per cent of the metal made in the United States in 1935 was produced.

World production of aluminum in 1935 is estimated at 247,000 metric tons, an increase of about 50 per cent over that of 1934 (170,000 metric tons). The principal producing countries and their pro-

duction, in metric tons, for 1935 and 1934 are: Germany, 62,838 (37,158); United States, 54,112 (33,646); U.S.S.R., 25,000 (14,400); France, 21,847 (16,300); Canada, 20,556 (15,500); Switzerland, 19,432 (8,100); United Kingdom, 16,033 (12,500); Norway, 15,387 (15,500); Italy, 13,085 (12,800).

AMERICAN ASSOCIATIONS AND SOCIETIES. For various scientific and other organizations, whose official titles begin with the word American, see under the important descriptive word of the title.

AMERICAN LAW INSTITUTE. See LAW.

AMERICAN LEGION. An organization of World War veterans, chartered by Congress in 1919. Its purpose, stated in the preamble of its constitution, is "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The Legion's seventeenth national convention was held at St. Louis, Mo., September 23-26, 1935. There was an accredited delegate attendance of 1207, representing every State, the District of Columbia, the departments of Alaska, France, Hawaii, Italy, Canada, Panama, Puerto Rico and the Philippine Islands outside the continental limits of the United States, and four outlying posts not attached to a department, Ilavana (Cuba), Guam, Argentina and China Post No. 1.

By a unanimous vote, the convention adopted a clear-cut resolution reaffirming its 1934 Miami, Fla., mandate for the immediate payment of the Adjusted Service Certificates (bonus) at full face value, with cancellation of interest accrued and refund of interest paid, and in unmistakable terms renouncing coupling the payment of these certificates with "questions of finance or theories of currency." The introduction of "currency expansion" into bonus legislation in the First Session of the 74th Congress, over the opposition of the Legion, is credited with having made it possible for the Senate to sustain a presidential veto of the bill, by a vote of 54 to 40, on May 23, 1935.

The resolution adopted by the St. Louis convention set forth:

We request immediate cash payment of the Adjusted Service Certificates at face value, with cancellation of accrued interest on loans, and refund of interest paid, and do hereby reaffirm the Miami Convention resolution on this subject

We request the immediate favorable action of the Congress, and the approval of the President of the United States, upon this clear-cut and single issue, without having it complicated or confused by other issues of Government finance, or theories of currency with which the Legion does not intend to become involved.

We hereby ratify and approve the efforts of National Commander Frank N. Belgrano, Jr. and the National Legislative Committee, on behalf of the Legion's bill at the last session of Congress.

It was the first time in the history of the Legion that a resolution requesting immediate payment of the Adjusted Service Certificates was adopted by unanimous vote.

The convention then adopted, as other major objectives, resolutions urging fulfillment of the

fourth point of the Legion's rehabilitation programme, which provides that in no event shall the widows and/or dependent children of deceased World War veterans be without government protection; enactment into law by Congress of the Universal Service Act, which seeks equal conscription of capital, industry and man-power in the event of war and the use of each in the service of the nation without special privilege or profit; and legislation completing that part of the National Defense Programme not yet enacted into law, with maintenance of gains made last year in raising the regular standing Army to 165,000 enlisted men, starting construction of the Navy up to the full London Treaty strength, and fulfillment of the required reserve components and supplies in all departments.

The above four mandates of the St. Louis convention were adopted by the national executive committee in Indianapolis on Nov. 2, 1935, as constituting the major legislative programme of the American Legion during 1936.

The St. Louis Convention also ordered distribution of a new national newspaper, *The National Legionnaire*, to the entire membership, in addition to the *American Legion Monthly Magazine*.

Cleveland, Ohio, was selected for the Eighteenth National Convention, to be held Sept. 21-24, 1936.

The accomplishments for the year 1935 up to the time of the national convention were reviewed by Frank N. Belgrano, Jr., of San Francisco, the retiring national commander, in his report. The principal items were rehabilitation, child welfare, and Americanism.

Rehabilitation. The National Rehabilitation Committee successfully worked for a broad programme of new government hospital construction with the result that \$30,000,000 were allotted for this new construction and extensions of existing facilities, assuring at least 11,816 additional beds. During the year 16,021 new cases of veterans seeking compensation or hospitalization were referred to the committee, making a total of 136,000 active or potentially active cases now on file. During the fiscal year ending June 30, 1935, the committee, through its efforts, recovered \$1,987,906 in direct individual claims for thousands of veterans whom it represented.

Child Welfare. The activities of the nationwide child welfare programme were expanded during 1935, with splendid cooperation of all the departments, posts and Auxiliary units. An army of 20,000 volunteer workers carried on this work. A known total of \$1,027,734 was expended during the twelve months ending July 31, 1935, in direct financial aid to 256,549 needy children of World War veterans. If all sums expended were reported, the total would exceed this sum by a considerable amount. One half of the income from the Legion's \$5,000,000 endowment fund is set aside for child welfare work, and of this allotment the entire amount was spent in relieving the suffering of children. Administrative expenses were paid by the Legion out of its national dues.

Americanism: Greater emphasis was placed upon the Americanism programme of the Legion during 1935 to combat militantly the increasing spread of Communist propaganda in the United States. The National Americanism Commission carried on with the enthusiastic support of every one of the Legion's 11,225 posts, a vigorous campaign for promoting education, youth activities and community services as the best means of building up a patriotic citizenship. The Legion school award medal programme, designed to implant in the minds of youth at an impressionable age the qualities of real citizenship, reached new heights with 7029 medals awarded during the year, this being 518 more than in 1934.

The membership of the American Legion on Nov. 14, 1935 was 839,622 as compared with 829,205 on Nov. 14, 1934. The national officers elected for 1935-36 were: National Commander, Ray Murphy, Ida Grove, Iowa; Vice Commanders, Raymond F. Gates, Hartford, Conn.; Dr. F. Whitney Godwin, Suffolk, Virginia; Louis R. Probst, Laramie, Wyoming; Dr. W. E. Whitlock, High Springs, Florida, and Oscar W. Worthwine, Boise, Idaho; National Chaplain, the Rev. Fr. Thomas D. Ken-

ned, St. Louis, Mo.; National Historian, Thomas M. Owen, Jr., Washington, D. C.; National Adjutant, Frank E. Samuel, Indianapolis, Ind.; National Treasurer, John Ruddick, Indianapolis, Ind.; and National Judge Advocate, Ralph B. Gregg, Indianapolis, Ind., the latter four being named and confirmed by the National Executive Committee, Nov. 2, 1935. National headquarters were at 777 North Meridian Street, Indianapolis, Ind.

AMERICAN LITERATURE. See LITERATURE, ENGLISH AND AMERICAN.

AMERICAN PSYCHOLOGICAL ASSOCIATION. See PSYCHOLOGY.

AMHERST COLLEGE. An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1935 approximately 841 students were enrolled. The active faculty numbered 73. The productive assets of the college amounted to \$9,500,000, and the income for the year was \$913,000. The library contained 200,000 volumes. President, Stanley King, LL.D.

ANDORRA, ăn-dôr'a. A small republic in the eastern Pyrénées, under the joint suzerainty of the Spanish Bishop of Urgel and the President of France. Area, 191 square miles; population, 5231. The capital, Andorra-la-Vieille, had 700 inhabitants. The Andorrans, who speak the Catalan language, are governed by a council-general of 24 members (12 elected every two years) elected for four years by male citizens of 25 years of age or over. On Sept. 18, 1933, the Council-General elected Pere Torres to be First Syndic (President) and Francisco M. Palanques to be Second Syndic (Vice President). The main occupation was sheep raising.

ANDREADES, ANDREW. A Greek scholar and economist, died at Athens, May 29, 1935. Born in Corfu, Dec. 12, 1876, he attended schools in France and England, where he was trained for educational work. In 1902 he was appointed a lecturer at Athens University, and became professor of economics there four years later. During the World War he served as his country's official censor, and in 1919 was one of the experts at the Paris Peace Conference. At the Danube Conference held in Paris in 1920-21, he served as plenipotentiary, also as a delegate to the League of Nations Assembly in the years 1923, 1924, and 1929.

In 1924, Dr. Andreades returned to his profession and gave a course of lectures at the Academy of International Law at The Hague. Later, he lectured at King's College, London (1926), at four Belgian universities (1927), at Lyons (1931), at Cairo (1932), and at Paris (1933). Also, he served as dean of the faculty of law at the University of Athens, but was compelled to resign through ill health in 1935.

In 1924, Andreades served as chairman of the Committee for Byron's Centenary, and he was president of the Athens branch of the Anglo-Hellenic League. He was a doctor of law and political science at the University of Paris, and a fellow of the Academy of Athens, as well as a member of many international organizations, including the Academy of Political Science, New York, and had been decorated by many governments and held degrees from several universities.

He contributed to various publications, in English and French, many studies on the economic and financial history of Greece; and on the economic problems of modern Greece. In 1919, while on a semi-official visit to the United States, he wrote an article for *The New York Times*, explaining the

grounds for the Grecian expectations at the Paris Peace Conference. He also contributed a volume to the Carnegie Endowment series on the economic problems of the World War, and articles on Greek economics, evidence of his deep knowledge of his subject, to the *Economic Journal*, *Contemporary Review*, and *Nineteenth Century*. One of his publications was a book on the financial history of Ancient Greece, issued in English by the Harvard University Press in 1933.

Other publications were: *Histoire de la Banque d'Angleterre* two vols., translated by Meredith (1904); *Lord Salisbury and Greece* (1904); *The Ionian Islands under the British Protectorate* (1907); *Gladstone as Economist and Financier* (in Greek) (1910); *Gladstone and Greece* (1910); *Sir Charles Dilke and Greece* (1918); *La politique Anglaise en Orient avant et après le traité de Berlin* (1922); *La population Anglaise pendant et après la grande guerre* (1924); *Le théâtre Anglais contemporain*, Brussels (1925); *Philip Snowden* (in French and English) (1930).

ANEMIA. See BIOLOGICAL CHEMISTRY.

ANGLO-EGYPTIAN SUDAN. A British-Egyptian condominium in northeast Africa. Area, 1,008,100 sq. miles; population (latest estimate), 5,728,551 including 51,471 non-natives. Chief towns: Khartoum (capital), 49,741 inhabitants; Omdurman, 110,436; Khartoum North and Rural District, 107,720; Wadi Halfa; Merowé; El Damer; Athbara; Port Sudan, Suakin.

Production. For 1934-35 the estimated production of cotton (ginned) was 45,000 metric tons from approximately 365,560 acres. Gum arabic valued at £E494,957 was exported during 1934. Sesame, groundnuts, senna leaves and pods, dates, mahogany, hides and skins, chillies, dom nuts (vegetable ivory), salt, ivory, gold, and shea seeds were other products. Durra (great millet), the staple food of the natives, and dukhn (bulrush millet) were the main grain crops. Along the banks of the Blue Nile the forests are rich in fibres and tanning materials. Livestock in the Sudan in 1932: 2,250,000 sheep, 2,000,000 goats, 1,250,000 cattle, 400,000 camels, 352,000 asses, 22,750 horses, 1000 mules, and 5000 swine—kept by the Nubas only.

Trade. In 1934, imports totaled £E3,946,796 and included government stores; exports, £E3,848,896 (excluding reexports of £E267,977 and goods in transit of £E133,379) of which cotton accounted for £E2,065,235. The Egyptian pound (£E) of 100 piasters was linked with the pound sterling of 97½ piasters and fluctuated with sterling at a practically constant ratio. Imports consisted mainly of cotton piece goods, machinery, metals and metalware, sugar, tobacco, coffee, tea, sacks, and automobiles.

Communications. On Jan. 1, 1934, there were 2019 miles of railway line (3 ft. 6 in. gauge) open to traffic. A motor transport service was operating from Juba to Aba (Belgian Congo), and to Nimule on the Uganda border. There are many caravan routes including one between El Obeid and Addis Ababa (Ethiopia). Government steamers ply the navigable arms of the Nile and its branches from Aswan (Egypt) to Rejaf.

Government. For 1934 (including receipts and expenditures of Sudan Railways), revenue totaled £E3,774,911; expenditure, £E3,749,488. The Sudan was administered by a governor-general (appointed by Egypt with the assent of Great Britain) aided by a governor-general's council. The Egyptian and British flags were to be used together. Governor-General in 1935, Sir G. S. Symes. See EGYPT and ETHIOPIA under History.

ANGOLA (PORTUGUESE WEST AFRICA). A colony of Portugal in central Africa. Area, 487,788 sq. miles; population (1934), 3,098,281. The chief towns were Nova Lisboa (the capital), Loanda, Benguela, Mossamedes, Lobita, and Malange. There were 73 schools for elementary and secondary education, and 106 professional schools.

Production. Coffee, maize, sugar, palm oil, and palm kernels were the main agricultural products. Cotton, wheat, cacao, tobacco, and sisal were also grown. The production of wax is important. Diamonds form the chief mineral production, and 483,448 carats were exported during 1933. The country also contains deposits of salt, copper, and lignite.

Trade. For 1934 (based on old U. S. A. dollars of 1.50463 grams gold), imports were valued at \$5,200,000; exports totaled \$7,200,000—the main items were diamonds, coffee, maize, and sugar. Trade is mainly with Portugal.

Communications. There were 1425 miles of railway line open to traffic. Highways comprised 17,215 miles of good roads and 20,713 miles of secondary roads. Telegraph lines aggregated 5790 miles; telephone lines, 259 miles. Angola had 19 wireless stations.

Government. The budget for 1934-35 was balanced at £1,374,073. A decree of May 9, 1935, provided that for the future the fiscal year for Angola would be the calendar year. It also approved the budget expenditure of 165,573,193 paper escudos (paper escudo equaled \$0.0449 on June 13, 1935) for the 18 months ending Dec. 31, 1936. The country is under a high commissioner aided by a partly elective consultative council. High Commissioner in 1935, Col. E. F. Viana.

ANSCHLUSS. See AUSTRIA, CZECHOSLOVAKIA, FRANCE, GERMANY, HUNGARY, ITALY under *History*. LITTLE ENTENTE.

ANTARCTIC EXPLORATION. See POLAR RESEARCH.

ANTHROPOLOGY. This was in no way an exceptional year. The flow of reports on African natives, noted during the last few years, seems to have been checked; similarly with reports from German authors in general. On the other hand, publication has been steadily increasing in the United States to something like pre-depression standards.

No striking finds of prehistoric man were reported. The year's most important contributions in this respect were evidences of early man in North America. Much may be expected in the near future from the increased activity of archaeological efforts in the Soviet Union.

Theoretical discussions of any significance have been rare. R. Thurnwald's discussion of primitive law (*Werden, Wandel und Gestaltung des Rechts im Lichte der Völkerforschung*, Berlin) was premised on the view that law is no mere mechanism of procedure, but a dynamic thing integrated with all phases of social and religious life. A terminal volume of W. Schmidt's *Der Ursprung der Gottesidee* (Pt. 2, vol. vi, Münster) was a synthesis of primitive religion in America, Asia, Australia, and Africa from the culture-historical point of view (*Kulturkreislehre*).

Ethnography. An excellent survey of the *Present State and Future Development of Ethnographical Research in South Africa* by I. Schapera (*Bantu Studies*, 8:219, Johannesburg) augurs well for coordination of effort by students there. At-

tention was called to the principal deficiencies in ethnographic surveying of Bantu, Bergdama, Hotentot, and Bushman peoples, the voluminous but fragmentary literature assessed, and plans laid for coordinated research.

An attempt to define the *Culture Areas of Nigeria* by W. D. Hambly (*Field Mus. Nat. Hist. Publ.*, 31, No. 3) was not wholly successful, primarily by reason of the very real intricacy of cultural relationships in this west African area. It does seem possible, however, to show a correspondence between geographic zones and cultures. In the dense coastal forest is true Negro culture; northward of 8°N. this is overlaid by elements of Mohammedan and Mediterranean derivation; between 10° and 14°N., i.e., to the Sahara desert fringe, is a culture belt characterized by the use of horses, camels, and oxen, ox culture prevailing in the south, camel nomadism in the north.

An ethnographic account from n.e. Angola (H. Baumann, *Lunda*, Berlin) relates especially to the Vachokue. According to this author, Angola forms part of a cultural province which includes the southern Congo, the Zambesi peoples, and Southern Rhodesia.

A suggestive discussion of *Indonesian Influence on East African Culture* (*Jour. Royal Anth. Inst.*, 64:305) by J. Hornell notes (1) that voyaging from Sumatra and Java to Madagascar may have been by stages via southern India and Arabia (7th century A.D.?), later direct to Madagascar (10th century); (2) that Malagasy (Malay) may have preceded the negro element in the island, the latter being escaped slaves; (3) elements of material culture, notably the outrigger-boats (and probably features of the Zimbabwe ruins, Rhodesia), are distributed along the e. African coast in negro cultures.

Two accounts from Melanesia concern Manus in the Admiralty Islands and the Solomon Island natives. *Manus Religion* (*Mém. Amer. Phil. Soc.*, 3) was described by R. F. Fortune as revolving in part about the special relation between each man and his father's ghost, which gives moral sanctions, aid, and protection. Illness results from sin; confession is its normal cure. The result is a puritanical moral code. The ancestral ghost, expected to assure long life and protection from other ghosts, is cast out if it fails in its duty. An extended description of the natives of n. Bougainville and adjacent Buka, n.w. Solomon Is., by B. Blackwood (*Both Sides of Buka Passage*, Oxford) relates primarily to social, sexual, and economic matters. The social unit within the village is the immediate kin group, beyond which linkage is closer with a man's matrilineal lineage (clan) than with his father's lineage. Nevertheless, personal property is inherited indifferently by a man's son or his sister's son. Certain lineages take precedence over the rest, their heads being in effect chiefs. Inasmuch as it has been frequently stated of natives to the west and in Australia that they had no knowledge of physiological paternity, it is noteworthy that here a belief in the possibility of impregnation without intercourse exists along with full understanding of the sexual act.

Special reports on the archaeology of Polynesia continued to appear. Among these K. P. Emory's *Archaeology of the Pacific Equatorial Islands* (*Bull. Bishop Mus.*, 123), relating to the Phoenix group and adjacent islands, supports the conclusion that a close cultural bond existed between Malden Is. and Raivavae, Austral Is., and on the other

hand suggests influences from Tonga in Fanning Island.

A discussion of *Archaeological Problems in Australia* (*Jour. Royal Anth. Inst.*, 65:145) by D. S. Davidson may prove fertilizing in a neglected field. To be sure, thanks to a poor material culture and the nomadic habits of the natives, excavations may not prove rewarding, but at least one deep stratified site has been exploited in South Australia and now several caves are reported from the northern area.

A significant contribution to the problem of man's antiquity in America appeared in the report on *A Folsom Complex* (*Smithson. Misc. Coll.*, 94, No. 4) by F. H. H. Roberts, Jr. While the discovery of stone blades bearing peculiar fluting with fossil bison, musk ox, mammoth, and other extinct animals at Folsom, New Mexico, and elsewhere during the last decade has been taken as evidence of man's presence during the terminal Pleistocene, there has been no evidence available of the content of the culture. Roberts' report on a site occupied by makers of these blades (Ft. Collins, Colo.) indicated a stone-working culture of only modest range, with two types of Folsom blades.

Alaska has been looked to hopefully for evidences of the same nature on the assumption, generally held, that *Early Migration of Man to America* (*Natural History*, 35:356) took place via Behring Straits. Recent finds there, in the opinion of N. C. Nelson, coincide with finds in the Gobi desert, central Asia. "The specimens furnish the first clear archaeological evidence we have of early migration to the American Continent, apparently during the final or Azilian-Tardenoisian stage of the Palaeolithic culture horizon, possibly 7,000-10,000 B.C."

A general summary of the *Evidence of Early Man in North America* (*Museum Journal*, 24:61), provided by E. B. Howard, consolidated all archaeological, paleontological, and geological findings to date. It was held that (1) there is no longer doubt of the association of artifacts with animal forms now extinct; (2) these artifacts are invariably Folsom or the similar Yuma stone blades; (3) the gap between these finds and the earliest proto-historic Indian culture (Basket Maker) may yet be bridged by other finds.

For years it has been assumed that the great Plains area was devoid of archaeological interest, that it was relatively barren, and that at best remains there would be found to be only superficial. But a series of investigations in the heart of the area by W. D. Strong serve not only as *An Introduction to Nebraska Archeology* (*Smithson. Misc. Coll.*, 93, No. 10) but as suggestive of what may be revealed throughout the Plains. Stratified deposits show that historic Indian cultures were antedated by a relatively rich "Nebraska" culture, itself arising from the considerably earlier Stern Creek stage. The "Nebraska" culture (with agriculture and rectangular earth lodges) shows definite affiliations to the south and east. Contemporaneous with these were two local cultures (Signal Butte III, Dismal River) to the west. While these finds offer antecedents for the historic cultures, a far more ancient series was revealed on the higher plains. Here Signal Butte I, the earlier, bore stone blades of the Folsom type. There is a possibility that these results will be duplicated elsewhere in the Plains, but it is to be noted that Strong does not now repeat the exaggerated claims for the universality of an agricultural complex in

prehistoric times made in an earlier paper (*Amer. Anth.*, 35:271, 1933).

An assessment of the archaeology of the most fully exploited primitive area in the world, southwestern United States, was provided by F. H. H. Roberts, Jr.'s *Survey of Southwestern Archaeology* (*Amer. Anth.*, 37:1). While the views propounded were not new, the clarification of the involved situation may serve as a new point of departure.

The general condition of the Valley of Mexico in pre-Columbian times as now revealed by archaeology seems to have been an infiltration of successive tribes with differing cultures, not an unbroken cultural development (E. Noguera, *Antecedentes y Relaciones de la Cultura Teotihuacana*, Mexico, D. F.). Of special importance in this respect is the report on *Tenayuca* (Mexico, D. F.), the product of the Mexican government staff, a full record of the culture and history of the Aztec and Chichimec populations in the Valley of Mexico. Tenayuca was the seat of the Chichimec rulers, later an important fief of the dominion of the Tepanecs, and was finally in the hands of the Aztecs until after the Conquest. Stratified deposits corroborate the historical sequence.

Several full-length ethnographic accounts were published. F. G. Speck's *Naskapi* (Norman, Okla.) deals almost wholly with religious life and ideas of a people of interior Labrador. R. H. Lowie's account of *The Crow Indians* (New York) makes generally available the data on one of the most fully described tribes of the New World. *Wintu Ethnography* is represented as amorphous by C. Du Bois (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 36, No. 1). Bennett and Zingg's *The Tarahumara* (Chicago) was not only the fullest record for a north Mexican tribe yet published, but made a new estimate of cultural relations throughout the general area.

A discussion of suggested connections between the Eskimo language and Indo-European tongues was given by C. C. Uhlenbeck (*Mededeelingen Konink. Acad. Wetenschappen*, Afd. Letterkunde 77, A. No. 6, Amsterdam). Another discussion, *Phonetic Shifts in Algonquian Languages* (*Int. Jour. Amer. Ling.*, 8:131) by T. Michelson may serve to establish the historical relations of these mid-North American groups.

A methodological caution attaches to L. Spier's *The Prophet Dance of the Northwest* (*General Series in Anth.*, 1). The Ghost Dance of the Plains Indians, a messianic movement that had its inception among the Paviotso of western Nevada and swept like wildfire through the Plains in 1890, has long served as a classic example for the direct interpretation of cultural developments in psychological terms. It has been assumed that the preachment of a world freed of white domination through supernatural agencies, with the return of the dead—an end hastened by frenzied dancing in a prescribed form—was the spontaneous expression of despair at the encroachments of the whites. But not only had Kroeber shown that a precisely identical movement spread from the Paviotso through California some 20 years earlier, but now Spier has demonstrated that the origin of the complex lay in the Prophet Dance of the northwestern tribes situated between the Rockies and the Coast Range. Demonstrably as far back as 1790, a series of prophets or messiahs appeared in this region who preached the same doctrine and made use of an almost identical dance pattern with that of the Plains, far in advance of any encroachment or even knowledge of the whites. While it can be

maintained that the disruption of tribal life in the Plains in 1890 served as cause for adherence to the messianic movement, it is clear that both Plains doctrine and dance are explicable as the result of indirect historic contacts with the Northwest, not as devices developed on the spot in response to psychic needs.

There continues to be very little serious literature on South America. Evidences of types of social structure more complicated than the simple family organization, heretofore believed universal in South America, establish *Mandurucú Moieties* in the southern Amazon area (A. Kruse, *Primitive Man*, 8, No. 4). An extended account of the life and culture of the Jibaro of eastern Ecuador and Peru (*The Head-Hunters of Western Amazonas*, Soc. Scien. Fennica, 8, No. 1, Helsingfors) was a rarity among ethnographic reports from the continent in its great detail.

Using South American cultures as the point of departure, W. Krickeberg (*Zeitschrift f. Ethnol.*, 66:287) returned to the problem of ancient cultural connections between northern North America and southern South America, to which Nordenskiöld and others gave attention in earlier years. This author extends the list of parallels previously reported in the cultures of these two areas, which are separated by the higher cultures of the cordilleran region of Middle America. A critical examination convinced him that the common elements derive from a sub-arctic, or at least northern, culture in North America (and ultimately connected with the sub-arctic culture of Eurasia) which in ancient times flowed as far as Tierra del Fuego, and subsequently was overlain by the higher cultural developments of Middle America.

Since the archaeology of coastal Venezuela and Colombia has been little explored, data from *New Archaeological Sites in the State of Falcón, Venezuela* (*Ibero-Americana*, 11) by G. A. Nomland may prove a point of departure. The ceramic remains are generically like those of the Antilles, Panama, and southern Central America.

Prehistory and Physical Anthropology. Unusual activity in archaeology was reported in the U.S.S.R., where a large number of expeditions were dispatched by the Academy of Sciences and State Academy for the History of Material Culture (Leningrad) and the All-Ukrainian Academy (Kiev). Most Ukrainian sites date from Aurignacian times, but remains of other Upper Paleolithic, Mesolithic, and Neolithic strata were also found. Neolithic stations were discovered in the Baltic-White Sea area (*Sovetskaya Ethnografiya*, Leningrad, 1935:160). Bronze Age sites on the Volga and Don. In Trans-Caucasia, Zamiatnin distinguished three Upper Paleolithic levels, but notes the transitions from one to another, a characteristic setting them apart from the sharply differentiated Paleolithic cultures of western Europe but aligning with the Capsian and Natufian cultures of the Mediterranean. In the Crimea, Tardenoisian and Azilian (Mesolithic) finds were made. Excavations in Turkistan revealed remains of later date. Excavations of Neolithic graves on the Amur River (e. Siberia), under W. Bogoras, were directed toward the problem of early migrations into the New World.

A brief survey of current views of the development of man and the anthropoids from pre-primate forms, definitely useful to the non-specialist, was contributed by E. A. Hooton (*Homo Sapiens*, *Science*, July 12:19). The view that man diverged from the anthropoid line after the gibbon and

orang-utan, but before the gorilla and chimpanzee—and was not derived from an early tarsoid or lemuroid type—seems to be sustained by majority opinion. That ancestral *homo sapiens* appeared in early Pleistocene times and paralleled in development the Neanderthal and other fossil humans, rather than being directly related to them, was also held probable.

Fuller reports on the human remains of reputed great antiquity in East Africa by L. S. B. Leakey (*Stone Age Races of Kenya*, London) now permit more adequate scrutiny of the evidence. E. A. Hooton and A. Smith Woodward, e.g., express grave doubts of the Middle and Lower Pleistocene age of the remains, and hence scout the significance of these modern racial types of supposedly high antiquity (*Amer. Anth.*, 37:681; *Science*, 82:401).

To account for the present distribution of races, there must be assumed several almost world-wide migrations at an early date of three races—Australoid, primitive Negroid, and an infantile type of Negroid—in the tentative view of L. H. Dudley-Buxton (*Anthropos*, 30:343). It is wholly uncertain what the order of migration may have been or even that there were two distinct Negroid types.

It has been thought that the most fundamental racial relationships might be found, not in superficial anatomical characters, but in certain blood groupings which rest on basic physiological relationships. It has long been known that blood contains a limited number of substances or "factors" (four, five, or more) which combine variously in each individual, the combinations being heritable. Racial groups showing the same proportions of individuals with identical combinations have been presumed to be genetically related. But the world distribution of the blood groups offers very real difficulties to such a simple interpretation. Wyman and Boyd, in the most comprehensive paper yet published (*Amer. Anth.*, 37:181), suggest that the blood factors are of high antiquity, since they are identical with those of the apes, were carried throughout the world in the early dispersion of the basic races of mankind; and that the present races differentiated only subsequently. The alternative is to assume a series of mutations of the blood factors to account for their sporadic distribution, but the chances of such mutations are held to be very slight.

A comprehensive presentation of *Racial Affinities of the Peoples of India* (*Census of India*, 1, 3A, Delhi) by B. S. Guha is clearly the most significant contribution from that area since Risley's work in the Census of 1901. According to Guha's analysis of the anthropometric data, seven components are discernible in the present population. (1) As a basic substratum, a short-statured long-headed element with high cranial vault. Superimposed on this is (2) in the western littoral and Bengal a brachycephalic element of medium stature with flattened occiput, also high-headed. (3) In northern India, another long-headed strain with comparatively lower but longer head, tall stature, long face, prominent nose. In addition, in the aboriginal population is (4) a short group with long and moderately high head, strongly marked brow ridges, broad short face, small flat nose, predominant in central and southern India, and allied to the Veddas, Toalas, Sakai, and the aborigines of Australia. At an early time, this type displaced and intermixed with (5) a dark pygmy strain having spirally curled hair, remnants of which are found in the Perambicullian Hills (Madras). The true Mongoloid strain does not appear to have

entered India, but (6) a related brachycephalic type is dominant in the sub-Himalayan region from n.e. Kashmir to Bhutan, and (7) a second type, with medium stature and longish head, in Assam and n. Burma. Some suggestions were made by Guha of the succession and direction of movement of these racial elements, but the available prehistoric evidences are too few to give certainty to his formulation.

Expeditions and Activities. The Statens Etnografiska Museum (Stockholm) was separated this year from the Naturhistoriska Riksmuseet, yet remaining under the Royal Swedish Academy of Sciences. S. Linné and G. Montell carried on archaeological researches at Pico de Orizaba, Teotihuacan, and Calpulalpan in Mexico, also making ethnographic inquiries among Aztec, Otomi, Tepehuane, and Totonac peoples. G. Bolinder pursued ethnographic work among the little-known tribes of the tributaries of the Orinoco (s.e. Colombia) and archaeology near Bogotá. Collections were made by R. Malaise in n. Burma and Yunnan, S. Bergman in Korea, O. Janse in Indo-China, and R. Andersen-Barnholdt in Tahiti. For the Anthropologische Gesellschaft in Vienna, J. Wastl was occupied with the ethnography of northwest Papua (New Guinea). The Staatliches Museum für Völkerkunde in Berlin was unable to put expeditions in the field. This seems to have been the general circumstance of other Continental organizations.

For the Museo Nazionale di Antropologia e Etnologia (Florence), L. Cipriani made an anthropometric reconnaissance in southwest Asia, from southern India and Ceylon (Coorg, Cochin, and Travancore peoples) to Syria and Turkey. In Italian Somaliland, N. Puccioni investigated the Baguni and other tribes in the south, P. Graziosi the prehistoric remains near Bur Hacaba in the north.

There is reported from Peru the formation of a governmental division for the study of Indian communities and the assignment of supervision of antiquities to a Patronato Nacional de Arqueología for the Instituto de Antropología (Lima). T. M. Xesspe collected pottery at Chavin and explored between Huacho and Chancay and on the Marañón and the Pukara.

The National Museum of Canada (Ottawa) supported archaeological research by W. J. Wintemberg in Ontario and by D. Leechman of Eskimo remains at Port Burwell (Labrador). D. Jenness was engaged on the ethnography of the Coast Salish (Brit. Col.).

Ethnographic researches of the Bishop Museum (Honolulu) in Polynesia took P. H. Buck to Mangareva, K. P. Emory to the Tuamotos, E. Beaglehole to Pukapuka, C. S. Ford to Fiji, and E. S. C. Handy to Hawaii. Work in Micronesia included similar studies in Palau, Ponape, Kusaie, and Truk Islands.

In Washington the activities of the Bureau of American Ethnology were primarily archaeological and linguistic. In the first category was M. Stirling's inspection of sites in Guatemala, Honduras, Yucatan, and Florida, and F. H. H. Roberts, Jr.'s excavation of a Folsom culture site near Fort Collins (Colo.); linguistic investigations were made among Algonkin and Eskimo tribes east of Hudson Bay by T. Michelson and on Timucua (Florida) sources by J. R. Swanton. The staff of the United States National Museum had work by A. Hrdlička on Kodiak Is. (Alaska), H. W. Krieger at the Bonneville dam, Columbia River,

and F. M. Setzler in Kentucky and Georgia. At the Catholic University of America, R. Flannery continued field work among Cree and Montagnais (James Bay, n. Canada) and C. J. Connelly studies of primate brain morphology. Studies of growth were made for the Carnegie Institution by M. Steggerda in Yucatan and Guatemala, and S. D. Aberle among the Pueblos (New Mexico-Arizona), with several archaeological investigations at Copan (Honduras) and in the Guatemalan highlands.

Eight ethnologists visited Indian reservations for studies of their present status in relation to aboriginal cultures (under W. D. Strong) for the Bureau of Indian Affairs.

Studies in Middle America were undertaken for the University of Pennsylvania Museum: on the archaeology of Piedras Negras (Guatemala) by L. Satterthwaite and on Maya (Yucatan) ceramics by M. Butler. A general survey of the Guajira area (Venezuela-Colombia) was made by V. Petrullo and others. An archaeological survey of the lower Yukon River (Alaska) was directed by F. de Laguna.

Columbia University sponsored a large number of field trips: R. Fortune near Mt. Hagen (New Guinea), B. Quain on Vanua Levu (Fiji), B. Aginsky—Pomo (Calif.), M. Smith—Puyallup (Wash.); on several Plains tribes—R. Landes, Santee; W. Whitman, Ponca; J. Mirsky, Comanche; G. Welffish, Pawnee; M. Champion, Fox; A. Hoebel, Shoshoni; on two Southwestern tribes—E. Kennard, Hopi; R. Underhill, Mohave; and by J. Lips, Naskapi (Labrador); I. Goldman, Carrier (Brit. Col.).

Field projects of the American Museum of Natural History included archaeological work in the Valley of Mexico by G. C. Vaillant, in the archipelago of southern Chile by J. Bird, and Puerto Rico by F. Raney; ethnological work of Cree, Kutenai, Flathead, and Piegan (Montana-Canada) by C. Wissler, D. C. Mandelbaum, and C. E. Schaeffer. Excavations for the Museum of the American Indian (New York) were made in Vermont, in New York City, and the Virgin Islands by L. J. Korn. An ethnological trip to northeast Ecuador was undertaken by E. E. Loch.

Harvard University continued its archaeological investigations in Ireland, dispatched J. P. Gillin to the Quechua (Ecuador), G. Schwab to the Basa (Cameroon, w. Africa), J. M. Andrews to Siam, G. T. Bowles for racial investigations on the Tibeto-Indian border, and J. O. Brew for archaeology of Awatobi (Arizona). Yale University sent W. Z. Park to Paviotso (Nevada), G. P. Murdock to Tenino, and L. Spier to Klamath (Ore) for ethnology. For the Laboratory of Anthropology (Santa Fé), A. Lesser headed a party for investigating Kiowa (Okla.) ethnology; and for Tulane University, F. Blom made a reconnaissance of ruins in Honduras, S. M. Leche a biometric study of Indians in Chiapas (Mexico), while G. Kramer made an architectural study in Guatemala.

The archaeology of the upper Mississippi valley again engaged the attention of the University of Chicago: ethnological investigations were also made by G. McAllister among Kiowa-Apache (Okla.), M. Opler and E. Rosenfelds among various Apache groups (New Mexico), R. Zingg of Huichol (n. Mexico), and F. Eggan among Tinguian (Philippines). For the University of Michigan, investigations were made in ethnobotany (M. R. Gilmore), in ceramics (J. B. Griffin), and in Michigan archaeology (E. F. Greenman). For

Northwestern University, J. C. Trevor made a general ethnographic study on St. John, Virgin Is. W. C. McKern excavated mounds in n. w. Wisconsin for the University of Wisconsin.

The University of California sent three men to British Columbia for ethnological work: R. L. Olson to the Heiltsuk and Haisla, P. Drucker to Nootka, H. Barnett to Coast Salish; continued C. Nimuendajú's studies of the Ges tribes of eastern Brazil, and had a group investigating the distribution of culture traits in California and the Southwest. The Southwest Museum (Los Angeles) reported archaeological work in the Moapa valley (Nevada) by M. R. Harrington, in Yokuts territory (Calif.) by E. F. Walker, and in the southern California desert by W. H. Campbell; F. Densmore studied Cheyenne and Arapaho (Okla.) music. The University of Washington reported ethnographic work by V. Ray among the Interior Salish, E. Gunther among Makah, and M. Jacobs among Sahaptins, all in Washington.

ANTIGUA. See **LEEWARD ISLANDS, BRITISH.**

ANTIOCH COLLEGE. A nonsectarian co-educational institution in Yellow Springs, O., founded in 1853 and reorganized in 1920. The number of students enrolled for the autumn term of 1935 was 660, of which 434 were men and 226 were women. The faculty numbered 91. The productive funds of the institution amounted to \$269,307, and the operating income for the year was \$412,503. The library contained 46,645 volumes. President, Arthur E. Morgan, D. Sc. During 1935, Dr. Morgan also served as chairman of the board of directors of the Tennessee Valley Authority.

ANTI-SALOON LEAGUE OF AMERICA. A federation of churches and temperance organizations in the United States whose object is the extermination of the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon Leagues of four states and the District of Columbia. At the end of 1935 it embraced 40 state or territorial leagues and affiliation with 45 other national temperance organizations, as well as with the World League Against Alcoholism. (q.v.)

During 1935 the organization's principal efforts have been directed toward combating the efforts to extend the legalized liquor traffic, and in waging campaigns in the following states to prevent repeal of prohibition amendments in the state constitutions or statutory laws for the prohibition of the liquor traffic: Alabama, Georgia, Texas, and Kentucky. The organization has worked for the inclusion of the right of local option with respect to the sale of liquor in liquor control acts or license laws, and to carry territory dry under such local option laws where in force.

In view of the conditions brought about by repeal of the Eighteenth Amendment, which permit the wide-spread sale of intoxicating liquors, special emphasis has been laid upon education regarding the nature of alcoholic beverages. The League has also urged enactment of legislation to prohibit or restrict advertising which has as its purpose the stimulation of sale and consumption of alcoholic liquors. Temperance dramas, debates, and lectures have been sponsored. Statistical and factual matter, relating to the social and economic phases of the alcohol question, has been issued from the national office and by the American Issue Pub. Co., located at Westerville, Ohio.

The officers of the League in 1935 were: President, Bishop E. G. Richardson, Philadelphia, Pa., general superintendent, F. Scott McBride, Washington, D. C.; director of the department of educa-

tion, Ernest H. Cherrington, Westerville, Ohio; secretary, Andrew Wilson, Washington, D. C.; national attorney, Edward B. Dunford.

AQUEDUCTS. The greatest aqueduct construction now under way, in fact the greatest ever attempted by man, is the 220-mile Colorado River line which will carry water from the Colorado to the Metropolitan District of Southern California. This work has been described in previous **YEAR BOOKS.** Its most interesting feature is the huge tunneling operation involved (tunnels aggregating 92 miles in length), and interest during the past year has centered in the tunneling methods employed and the progress made in driving these bores. Some 13 contracting firms, plus the force-account works of the District itself, have invested no less than ten million dollars in plants and equipment for this work. This reflects in an interesting way the trend in modern construction. That is, in order to save interest by reducing the period of construction to a minimum and to replace costly hand labor by modern machinery, it is economical to spend millions on plant and equipment, only part of which expense will be returned through salvage at the close of the work.

Tunneling operations on this work have been carried on simultaneously from some 58 headings, 19 of which are reached from 10 adits, 12 from vertical shafts, and 27 directly from the portals. In some cases, particularly the San Jacinto and Valverde bores, heavy flows of water have been encountered. The rock varies from solid material requiring little or no support to sections demanding heavy timbering to carry the tremendous pressures. Gunite is being used where necessary to prevent air slacking of the exposed rock and spalling of the surface.

The rate of progress has been on an average, about 6 ft. per shift or 18 ft. per day. In one case (Seven Palms Tunnel) 54 ft. of full unsupported section was driven in one day and the monthly record (Copper Basin No. 2 Tunnel) has been 1084 ft.

Tremendous as this undertaking has been, as the year comes to a close, the actual driving of these tunnels is nearing completion and the problem of lining will go ahead in 1936.

In the East, the new Boston water supply work is rapidly nearing completion. The remarkable pneumatic-caisson cut-off of the Quabbin Reservoir, completed in 1934, has been followed by the placing of the hydraulic fill dam. The 24.6-mile Wachusett-Quabbin Aqueduct is practically complete and ready for service.

In New York, the proposed new Western Catskill Mountain Supply is still hanging fire, although the new distribution tunnel, No. 2, was completed and formally opened at the end of the year. Hartford, Conn., is again extending its 83-year-old system through developments on the East Branch of the Farmington River. A programme of progressive construction of the necessary works is under way. In the West, Denver, Colo., has continued the work to secure a supply from the western slopes of the Continental Divide by utilizing the pioneer bore of the Moffat Tunnel (see 1934 **YEAR BOOK**).

ARABIA. The great peninsula of southwestern Asia. Area, 1,200,000 sq. miles; population (estimated), 10,000,000. The divisions of Arabia are given below. See **ADEN.**

Bahrain Islands. An archipelago in the Persian Gulf near the Arabian coast of Hasa. The main islands were Bahrain, Muharrak, Sitra, Nebi Saleh. Total area, 213 sq. miles; population, 120,000. Chief towns: Manama (capital), 25,000 inhabitants; Muharrak, 20,000. Date cultivation, boat building, pearl fishing, and the breeding of white donkeys were the chief industries. For 1933-34, total imports were valued at Rs9,275,050; total exports, Rs6,754,800 (rupee averaged \$0.3788 paper for 1934). The islands were under the protection of Great Britain. Ruling Sheik in 1935, Hamad bin Isa al Khalifa.

Hadramaut. A region east of Aden, under loose British protection. The principal products were dates, indigo, tobacco, and livestock. The Qa'ati dynasty (represented by the Sultan of Makalla) ruled most of the territory but some of the inland towns and villages were governed by the Kathiri dynasty.

Kuwait. The state along the northwestern coast of the Persian Gulf. Area, 1930 sq. miles; population, 50,000. Capital and chief port, Kuwait. For 1933-34, imports totaled £258,857; exports, £94,516—the main items were pearls, horses, and wool. Kuwait was in treaty relations with Great Britain (represented by a political agent). Ruling Sheik in 1935, Sir Ahmed bin Jabir al Subah.

Oman. The southeasterly corner of Arabia. Gwadar, a port on the Persian side of the Gulf of Oman, belongs to Oman. Total area, 82,000 sq. miles; population, 500,000 (mainly Arabs but there was an infiltration of Negro blood near the coast). The chief towns were Muscat (capital) with 4500 inhabitants, and Matrah with 8500. The chief products were dates, limes, pomegranates, and dried fish. For 1932-33, imports amounted to Rs3,471,618; exports, Rs2,027,334 (rupee averaged \$0.3788 paper for 1934). Reigning Sultan in 1935, Sayid Said bin Taimur.

Oman, TRUCIAL. The six Arab states north of Oman, formerly known as the Pirate Coast. Area, 6000 sq. miles; population, 80,000 including 8000 nomads. Chief capital, Abu Dhabi (6000 inhabitants). The export of pearls to India was the chief trade of the coast ports. Each state is ruled by a sheik under treaty relations with Great Britain. The British Political Resident at Bushire in the Persian Gulf was the acknowledged adviser and arbiter for Trucial Oman.

Qatar. The Qatar peninsula to the north of Trucial Oman. Area, 8000 sq. miles; population, 26,000. Capital, El Beda. The country was ruled by Sheik Abdullah Ibn Jasim under treaty (Nov. 3, 1916) with Great Britain.

Saudi (sā-ōō'dē) Arabia, KINGDOM OF. The territory formerly known as the Kingdom of Hejaz and Nejd and its Dependencies. Ruler in 1935, King Abul Aziz Ibn Saud.

Nejd extended over some 800,000 sq. miles of central Arabia and included the Nafud and Dahna deserts. Population, 3,000,000 (estimated). Chief towns: Riyadh (capital), 30,000 inhabitants; Hufuf, 30,000; Mubarrak, 20,000; Shagra; Anaiza; Buraida; Hail; Jauf; Sakaka; and Hauta. Wheat, barley, dates, fruits, wool, hides, butter, Arab cloaks, and livestock were the principal products. Nejd was governed in patriarchal manner by the King. His eldest son (Emir Saud) acted as Viceroy at Riyadh where he normally resides.

Hejaz extended along the west coast from Trans-Jordan to Asir. Area, 150,000 sq. miles; population, 1,500,000 (estimated). Chief towns: Mecca, the capital and holy city of Islam, 130,000 inhabitants; Jidda, the seaport for Mecca, 40,000; Medina, the

site of Mohammed's tomb, 30,000; Yenbo (Yanbu), the seaport for Medina. Dates, honey, butter, fruit, hides, and wool were the main products. The principal income of the country was derived from the annual pilgrimage of Moslems from abroad. Hejaz was governed by a council of ministers under the presidency of the King's second son, Emir Faisal, who acted as Viceroy during the King's absence.

Asir, a province between Hejaz and Yemen, was ruled as an independent state by the Idrisi dynasty until 1926 when it accepted the suzerainty of Ibn Saud. In 1933, because of the Idrisi uprising, it was incorporated in Ibn Saud's dominions. Area, 14,000 sq. miles; population, 1,000,000. Sabiya, the capital, had 20,000 people.

Yemen. An independent state between Saudi Arabia and the Aden protectorate. Area, 75,000 sq. miles, population, 3,500,000. Chief towns: Sana (capital), 25,000 inhabitants; Hodeida (chief port), 40,000. The main products were wheat, barley, millet, coffee, and hides. King in 1935, Yahya Hamid ed-Din.

History. The movement for unification of the Arab states freed from Turkish rule during the World War gained momentum during 1935, with King Abdul Aziz Ibn Saud of Saudi Arabia as the directing influence. Ibn Saud's policy of conciliation of Arab differences was revealed in the peace treaty signed with the Imam Yahya of Yemen at Taif on June 23, 1934, after the Yemenite forces had been defeated in a short war (see 1934 YEAR BOOK, p. 39). The treaty was described as one "of Moslem friendship and Arab brotherhood." But on Mar 15, 1935, three Yemenite conspirators with drawn daggers attacked Ibn Saud and his eldest son, Emir Saud, as they were performing the religious rite of walking seven times around the sacred Kaaba at Mecca. The conspirators were held off by the Emir Saud and immediately shot to death by the Royal guard. They proved to be Zeidis, members of the dominant Moslem sect in Yemen, which was violently antagonistic to the Wahabi sect headed by Ibn Saud. It was uncertain whether the attempted assassination was inspired by religious or political motives, but the circumstances of the attack aroused great indignation throughout the Arab world and increased the prestige of the Saudi Arabian ruler.

The Italian preparations for invasion of Ethiopia (q.v.) provided a new incentive to Arab unity. At the invitation of Emir Abdullah of Trans-Jordan, the Emir Saud of Saudi Arabia and Arab leaders from Syria and Palestine met in Amman, the capital of Trans-Jordan, during Aug. 16-19, 1935, to consider Arab and Moslem interests in the impending conflict. They saw an eventual threat to their own safety in Italy's determination to expand in the Red Sea region. On October 3 it was reported from Jerusalem that King Ibn Saud had called a Pan-Arab conference to discuss further plans for Arab action with respect to the Italo-Ethiopian dispute. In line with this development was the report published in Cairo on December 2 that Saudi Arabia and Iraq had signed a defensive alliance and agreed to coordinate their currencies, school systems, and armaments, to establish joint diplomatic representation in foreign countries, and to abolish passport restrictions. Earlier in the year the two governments had reached an agreement for the opening of a bus route from Nejef, Iraq, on the Euphrates, to Medina and thence to Mecca, to facilitate the pilgrimages of Iraq Moslems to Mecca. The restoration of the Hejaz Railway, wrecked by Col. T. E. Lawrence and his Arab allies during the

World War, was the subject of negotiations between the British, French, and Saudi Arabian governments, according to an official communiqué issued at Mecca on September 28.

A future source of dispute between Ibn Saud and the British was provided by an agreement making Great Britain responsible for the defense of Akaba which was concluded by the chief of the British General Staff and Emir Abdullah of Trans-Jordan in April. Situated at the head of the Gulf of Akaba and at the junction of Egypt, Palestine, Trans-Jordan, and Saudi Arabia, Akaba was regarded as of the greatest strategic importance. Ibn Saud had repeatedly pressed his claim to it. The British were reported to be rapidly transforming Akaba into a strong naval, submarine, and air base in view of the possibility of trouble with Italy over the Ethiopian question.

It was announced on December 30 that the Sheik of Kuwait had granted an exclusive oil concession covering all his territory to an Anglo-American syndicate. The death of Ex-King Ali ibn Hussein (q.v.) of the Hejaz in Bagdad on Feb. 14, 1935, removed an old rival of Ibn Saud's from the Arabian scene.

Consult Elizabeth P. MacCallum, "The Arab Nationalist Movement," *Foreign Policy Reports*, May 8, 1935.

ARBITRATION, INTERNATIONAL The *I'm Alone* Case, which had been pending since 1929, was finally settled at Ottawa, Canada, on Jan. 9, 1935, by Willis Van Devanter of the American Supreme Court and Lyman P. Duff of the Canadian Supreme Court.

It will be recalled that the *I'm Alone* was sunk on Mar. 22, 1929, on the high seas, in the Gulf of Mexico, by the United States revenue cutter *Dexter*. By their interim report in 1933 the Commissioners found that the sinking of the vessel was not justified by anything in the Canadian-American Convention of Jan. 23, 1924. The Commissioners added in 1935 that it could not be justified by any principle of international law. Their findings are summarized as follows:

The vessel was a British ship of Canadian registry. After her construction she was employed for several years in rum running, the cargo being destined for illegal introduction into, and sale in, the United States. In December, 1928, and during the early months of 1929, down to the sinking of the vessel on March 22 of that year, she was engaged in carrying liquor from Belize, in British Honduras, to an agreed point or points in the Gulf of Mexico, in convenient proximity to the coast of Louisiana, where the liquor was taken from her in smaller craft, smuggled into the United States, and sold there.

We find as a fact that, from September, 1928, down to the date she was sunk, the *I'm Alone*, although a British ship of Canadian registry, was *de facto* owned, controlled, and at the critical times, managed, and her movements directed and her cargo dealt with and disposed of, by a group of persons acting in concert who were entirely, or nearly so, citizens of the United States, and who employed her for the purposes mentioned. The possibility that one of the group may not have been of United States nationality we regard as of no importance in the circumstances of this case. The Commissioners consider that, in view of the facts, no compensation ought to be paid in respect of the loss of the ship or the cargo.

The act of sinking the ship, however, by officers of the United States Coast Guard, was, as we have already indicated, an unlawful act; and the Commissioners consider that the United States ought formally to acknowledge its illegality, and to apologize to His Majesty's Canadian Government therefor; and, further, that as a material amend in respect of the wrong the United States should pay the sum of \$25,000 to His Majesty's Canadian Government; and they recommend accordingly.

The Commissioners found that the captain and members of the crew of the *I'm Alone* were not parties to the illegal conspiracy to smuggle liquor into the United States and sell the same there.

Accordingly they recommended that compensation be granted to the captain and to the other members of the crew.

Newton D. Baker's term as United States member of the Court of Arbitration at the Hague having expired, he was reappointed by President Roosevelt for a term of six years. Other members from the United States were Elihu Root, John Bassett Moore, and Manley O. Hudson. This Court of Arbitration, set up under the Hague Convention of 1899, is not to be confused with the Permanent Court of International Justice popularly known as the "World Court," also at the Hague, which came out of the Covenant of the League of Nations.

The settlement of the boundary question between the Dominican Republic and Haiti is a further demonstration of the devotion of the republics of the American Continent to the principle of mediation and arbitration and to the peaceful settlement of international controversies. On Feb. 27, 1935, the Presidents of the Dominican Republic and Haiti issued a joint statement concerning the settlement of the last remaining difficulties in connection with the demarcation of their common boundary. On the occasion of the settlement of this question, the Governing Board adopted a resolution sending to the people and Governments of the Dominican Republic and Haiti its cordial congratulations, "in the hope that the shining example which they have set may serve as an example whenever similar disputes may arise between the nations of the Pan American Union."

ARCHÆOLOGICAL INSTITUTE OF AMERICA. A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has largely accomplished its purpose through its American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Bagdad, the School of American Research in Santa Fe, N. M., the American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Mediaeval and Renaissance Studies. In 1935 it had 50 affiliated societies or chapters, with a membership of about 2500. The official organ is the *American Journal of Archaeology*, a quarterly. The officers in 1935 were: President, Louis E. Lord, Oberlin College; first vice-president, David M. Robinson, Johns Hopkins University; general secretary, Clarence Ward, Oberlin College; treasurer, Rollin H. Tanner, New York University; and recorder, Stephen B. Luce, Boston, Mass.

ARCHÆOLOGY. The growing interest in Biblical lands is evidenced this year in the increase in number of sites excavated in the Holy Land or contiguous territory. Mesopotamia also still holds the interest of scholars. Correspondingly less has been done in Egypt and in Greece.

At Alexandria an interesting group of Hellenistic tombs has been found by Dr. Adriani, curator of the Græco-Roman Museum at Alexandria. Here, under a Roman camp, adjacent to the shore at Mustapha Pasha, he located four tombs of Hellenistic date hewn in the native rock and dating not later than the close of the 3d century of our era. They all have a court open to the sky and are executed in the pure Doric style. Particularly interesting is the fact that the walls preserve the fresh colors with which they were decorated. The subjects are riders on horseback. The work was probably done in the time of Ptolemy IV.

At Cairo between the pyramids and the Great Sphinx Professor Hassan has located a trench which leads straight from the pyramid of Chephren to the Sphinx. In all probability the road went all the way from the pyramid to the valley temple, now known as the Temple of the Sphinx. At present, however, the road ends at the Sphinx which leads to the conclusion that the Sphinx was built by Chephren or constructed after his death. Bricks have been found which show that the wall around the Sphinx was erected by Thothmes IV.

The road referred to was used to transport back and forth the statue of the king from one temple to the other. Holes in the sides were cut to receive poles to support an awning for protection against the heat of the sun. On either side of the road were found a number of tombs of which the most important is that of Chephren's daughter, Auser Rehktra. To the east of this burial was located the tomb of a priest of Rehktra, by name Ka-em-Nefert. Strangely enough most of the inscriptions found in this tomb were concerned with the queen. A fresco in the tomb represents the queen standing in the attitude of presenting a lotus flower to the priest. Another tomb in this locality is that of a famous artist who had been employed in decorating the royal tombs. His name was In-Ka-ef.

Besides discovering the road referred to, Hassan has uncovered the front portion of a miniature sphinx in the rubbish lying to the east of the pyramid of Chephren. It is about the size of a lion and gives evidence that the great sphinx dates about 2800-3000 B.C.

One of the most interesting finds made by Professor Hassan this year was two "sun boats" which had been cut deep in the native rock immediately to the south of the cult temple. The "night" or resurrection boat had been covered with 22 massive blocks of stone to render it dark. The boat itself is about 104 feet long and 39 feet deep. The "day" boat is about 94 feet in length. In the neighborhood were found also some 70 statues of Chephren broken to bits. In the tomb of Chephren's priest, Dua-ka, has been found a painting of a nude dancer and other figures which beat time with their hands in time to the dance.

The work of the Egypt Exploration Society this year has been focused, at Tell el-Amarna, on the great palace of Ikhnaton, which reached about half a mile along one side of the main street of the town. A bridge built over the road connected it with the King's private residence. A great hall was found at the southern end of the palace, the roof of which was supported by many piers built of brick. The walls themselves were ornamented with faience plaques showing daisies set into a green ground. At the northern end of the palace, in the harem, the columns were ornamented with pictures of ducks hanging head downward and with likenesses of the royal family. On the wall facing the sunken garden was a picture of a scene on the river Nile.

At Hermopolis has been found an unusual house the front of which resembles an Egyptian pylon. The decoration of the floor shows that it is of the Græco-Roman period. The house was constructed of rough bricks which had been coated with stucco. On the ground floor the rooms were vaulted and the walls were covered with religious pictures. On the second were also four rooms. The first room on the ground floor was public, decorated in the Alexandrian style imitating marble and breccia; the second was a sanctuary where was a tomb. Here was represented the dead, a woman, presenting herself to Osiris.

In Palestine, at Bethel, excavations this year have shown that between 2000 B.C. and 69 A.D. as many as a dozen settlements were made on the site. The first reach back into the bronze age. At Jericho Garstang has found a cult statue dating about 3000 B.C. It is the earliest sculpture that has been discovered in Palestine. At Lachish, 25 miles to the south of Jerusalem, the Wellcome Archaeological Research Expedition has uncovered a large cemetery belonging to the latest copper age. Some of the burials were in small chambers oval in form and approached by a narrow shaft. In the chambers were found food vessels, and daggers and javelins of copper. In the succeeding period the burials were of the contracted variety. The excavations also revealed that the chief defense of the city at this time was a steep revetment which was flanked by a wide trench. Under the rubbish of the city was found a temple built of stone and mud. It contained a small sanctuary into which one penetrated through an antechamber. Underneath this temple was uncovered the temple treasure and much pottery, and on the base of the shrine behind the large altar was found a perfume flask like those known from 18th. dynasty Egyptian pictures. Along with other remains there turned up a number of scarabs bearing the name of Amenhotep III. One scarab carried the name of queen Tyi. In the late Jewish levels were recovered ten pieces of pottery carrying Hebrew writing in ink dating not later than 588 B.C. They give the names of Jeremiah, Mattathiah, Gemariah, and Jaazariah. The name Jahve occurs several times.

The finds on this site make it clear that the original foundation goes back to a time soon after 1403, to a time immediately preceding its revolt from the rule of Ikhnaton. The place fell into ruin at the time of the Babylonian siege just before the time of the first exile. It was rebuilt by the Persians after the return in the time of Cyrus.

At Mizpah the Pacific School of Religion has discovered a large burial cave which explains the manner of burial described in the story of the burial of Sarah. The cave contained at least sixty interments dating from 1200-900 B.C. This seems to indicate a long family history.

At Dura in the rubbish of a circuit wall of the place have been found three painted wooden shields belonging to members of the Roman auxiliaries. They are oval in shape and covered with gypsum upon which were painted classical subjects. The metal bosses which protected the centres have disintegrated. Excavations on the acropolis have brought to light burials reaching from the 3d century B.C. to the time of the destruction of the town. Diggings in the neighborhood of the redoubt have revealed that it rose above a ravine by some 20 feet. Just to the south of the Palmyrene gate has been found a small temple of Zeus Kynos. In front of the tower of the town the excavators uncovered a monumental staircase which led up to the top of the tower. Perhaps the most important find in this place is a piece of horn which may have served as the ornament of a quiver. The design which shows stags finds its nearest parallel in the art of Siberia and south Russia.

At Mari, near Abu Kemal in Syria, the Louvre Expedition has continued its work this year with the finding of a great palace which dates in the third millennium B.C. It was destroyed by Hammurabi about 2000 B.C. In a beautiful state of preservation it is the most complete piece of architecture known from this time. While only a small portion has been cleared as yet, its size may be

EXCAVATION OF THE AGORA, ATHENS, GREECE.

A view from the southeast

ARCHÆOLOGY

Contents of Geometric Grave, End of the 8th Century B.C.

Ostraca Noted 487-483 B.C.

ARTICLES RECOVERED FROM THE AGORA, ATHENS

imagined from the fact that already 69 rooms and courts, covering 5000 square meters, have already come to light. In places the walls rise to a height varying from 3 to 16 feet. The result is that complete doorways have been preserved. Light was admitted through high doors which opened upon the courtyards. Several of the bathrooms are preserved in perfect condition. Sometimes there were hot and cold baths in each. The floors are well paved with baked brick. The walls of the building were plastered with a coat of mud and chopped straw and in the more important rooms the decoration consisted of alternating bands of black and red or spirals of white and blue. In the building were found two schoolrooms equipped with earthen benches. On the floor lay dishes which held shells for counting. In one small room were discovered 1600 clay tablets dealing with financial matters.

The expedition of the University of Cincinnati has this year completed its fourth campaign on the site of Troy. During the work the area at the northern edge of the hill was examined and found to belong to the period known as Troy I. Here were found a considerable amount of material belonging to at least three houses of the period. These buildings were of a rectangular plan and on the floors were scattered a considerable amount of pottery as well as implements made of stone and bone. Among them were two figurines, one of terra cotta and one of marble. Three infant burials were uncovered, one under the floor of the house and two outside. In the central part of the site, that is in Troy II, the investigators found a group of small rooms which may have served as storerooms. They were connected with the megaron of the house. In this locality was found much pottery as well as many small gold beads, spindle whorls, and many weights for looms, made of terra cotta. On the road lying outside the south gate of Troy VI was discovered a house that had been utterly destroyed by fire. The heat had been so great as to calcine the walls. In the building was a hearth and in one room an oven, a millstone together with many vases.

At Ishchali, near Bagdad in Mesopotamia, Dr Thorakill Jacobsen started his first campaign. The surface strata he found to date from about 1900 B.C., the time of Hammurabi. Behind the gate of the city wall he found a large temple in which were three sanctuaries to which entrance was afforded by a forecourt. An inscription on a cylinder seal proved that the place was dedicated to Ishtar-Kitum. A pavement of baked brick overlaid with bitumen led from the court into the antechamber. At the end of the pavement were found square masonry boxes which served as pivots for the great cedar doors. An open doorway admitted to the cella proper in which was located a statue of the goddess in a niche set in the main axis of the temple so that the worshipers who might not enter the sacred area could see the statue when the doors of the antechamber were thrown open. Among other finds made in the temple was a bronze lamp in the shape of a lion. The most distinguished find was a piece of a stone vase ornamented with figures of kneeling goats of which the eyes were inlaid with shell.

Further work has been done on the site of Sargon's palace at Khorsabad. Here the citadel and two other quarters have been dug. Another palace, just as massively built and about two thirds the size of Sargon's, has been discovered. It breaks through the southwest wall of the town just as the other palace penetrated the northwest wall. In the

building was found the base of a huge monolithic throne. It is possible that the palace was the residence of Sennacherib when crown prince.

The Iraq Expedition of the Oriental Institute of the University of Chicago has continued its investigations at Tell Asmar and at Khafaje, as well as starting the work at Ishchali already referred to. The temple of the god of fertility at Tell Asmar has been completely cleared showing that 26 successive stages can be traced over a period of about a thousand years. At a depth of over 40 feet were found the remains of the original building, which date before 3500 B.C. As a result of the work much light has been thrown on the early dynastic period which is practically unknown on other sites.

At Tepe Gawra, in Mesopotamia, the joint expedition of the American School for Oriental Research and the University of Pennsylvania has finished its fourth season's campaign. Trial pits were dug in a lower part of the tell which seem to prove that the place is possibly the oldest site in Asia. The city now uncovered dates about 3750 B.C.

In the district of Arkalochori in Crete the Candia Museum has discovered gold, silver, and copper axes of the Minoan age. Besides these were found enormous swords. The objects date around 1600 B.C. The most important find was a copper double-ax bearing three lines of hieroglyphic writing. This is the first discovery of such a thing in Minoan digs.

At Kourion in Cyprus the University of Pennsylvania expedition has found that a Hellenistic city on this site was badly wrecked by an earthquake in the late 4th century A.D. Many people were trapped by the falling roofs. The site was of great antiquity, reaching from the neolithic period to the time of the earthquake. The fortification wall (in places 36 feet thick) in its lowest parts dates from the 9th century B.C. Besides the late finds the expedition opened a dozen geometric tombs which contained pottery of a kind not known before.

In Athens the American School of Classical Studies has under the direction of Professor Shear successfully completed its fifth season's campaign in the agora. Many geometric graves of a fairly uniform type have been opened. They were partly cut in the bed rock of Kolonos Agoraios and completed with rubble work. Two Mycenaean burials were also discovered. Among the pieces of pottery recovered were representatives of the work of Euthymedes and Brygos. The latter was of the white ground variety on a spool or hobbin. The subject represented is Helios rising from behind hills or clouds. It is a counterpart of the group of Selene on a cylix in Berlin. One of the most interesting finds is a long list of ostraca which includes all the names of those mentioned by Aristotle as ostracized as well as the names of others who were voted against but who escaped that fate, together with those not previously known. Among those so mentioned are the names of Aristides, Boutalion, Charias, Hierocles, Hipparchus, Callias, Callixenus, Cydrocles, Megacles, Pisisstratus, Themistocles, Thrasycles, and Xanthippus. Callias won the pancration in 472. Twenty-six sherds bear the name of Themistocles. Among the sculptures found should be mentioned a fine archaic head of a bearded man and a close replica of the Venus Genetrix. The latter was found near where the shrine of Aphrodite must have been. In the centre of the excavation was discovered the marble floor of an orchestra, which was covered with a heavy layer of burned material. Behind the Odeum was uncovered a 2d century Roman temple found inside a rectangu-

lar marble structure 217 feet by 123 feet. Nearby was discovered a portico 470 feet long.

At Corinth the most outstanding discovery of the American School is the right forearm of a chryselephantine statue, probably of a woman, which was found in a cistern which had been filled with rubbish in the 3d century B.C. Further digging was carried on in the porticoed building which had been originally used to house shops but had later, in Roman times, been adapted to public use. Here was found a very beautiful example of elaborate incrustation in marble. In one room was discovered a fountain executed in variously colored marbles. The basin is rectangular and so constructed that water trickled at all times over the lip thus intensifying the color of the stone. On each side of the basin is a tall pilaster of purple breccia topped with marble capitals. Bronze spouts also served to keep the upper part of the fountain wet.

At Aquileia in Italy an imperial forum has been uncovered. At Pæstum work has been continued on the site of the Heraeum. The whole area of the sacred precinct has now been explored with the result that the foundations of a temple about 30 by 40 meters has been brought to light. It is larger than the temple of Ceres at Pæstum, but of the same type and of the same age, namely, about 500 B.C. Near the great temple is a small one 9 by 12 meters, dating from 700-600 B.C. Not the least interesting part of the finds is a large amount of pottery of the Corinthian and Proto-Corinthian styles, which point to an earlier building. Along with these finds beneath the temple was located a fine Hera Kouroutrophos. In the area between the two temples were found about 1200 objects, mostly ex-votos. From the old temple were recovered two excellent sculptured metopes, one representing the Rape of Latona by the Giant, Tityos, the other, and the better, showing a centaur.

Recent digging on the Aventine in Rome has uncovered a temple of Jupiter Dolichenus and a statue of the god. The figure holds a thunderbolt in its left hand and a double ax in the right. At Rodi an important find has been made of pottery and jewelry in the form of crowns, rings and buttons. The most remarkable find is a large bowl of silver ornamented with palmettes enclosed in spirals, or volutes ending in the heads of swans. During work on the Cathedral at Trieste the workmen uncovered the ruins of a basilica and a theatre.

At Avebury, in England, has been unearthed the largest megalithic stone circle known in the country. The place embraces about 29 acres and was originally enclosed with unhewn stones of different heights. Some of those still standing are 20 feet in height. Evidence points to the theory that the circle is to be associated with different cultures. For example, the stone circle almost beyond doubt belongs to the time of the "beaker" folk, who came into England about 1900 to 1700 B.C. from Holland and Germany.

At Chichester a large Roman amphitheatre has been laid bare outside the eastern city wall. It was built of chalk, limestone, flint, and Roman bricks. It is dated by the discovery of coins of Antoninus Pius and Domitian. At Colchester has been discovered a Roman temple of the 1st century of our era.

ARCHITECTS. THE AMERICAN INSTITUTE OF. A society, founded in 1857 to unite in fellowship the architects of the United States and to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession. The membership of its 68 local chapters in 1935 numbered

more than 3400 of the 7000 practicing architects in the United States.

There was continued, under a modified programme, during the winter of 1935-36, the survey of historic American buildings, inaugurated by the Civil Works Administration and the Department of the Interior so as to provide employment for many architects and architectural draftsmen. With the assistance of the presidents of the institute's local chapters this work was organized on a regional basis. There were filed in the Library of Congress sketches and photographs of many important historic edifices in these districts. Each building was accurately measured and drawn so as to permit its reconstruction, if desired, at some future date.

The official organ of the society is *The Octagon, a Journal of The American Institute of Architects*. The officers elected at the convention held in Milwaukee, Wis., in May, 1935, were: President, Stephen F. Voorhees, New York; first vice-president, Louis La Beaume, St. Louis, Mo.; second vice-president, Francis P. Sullivan, Washington, D. C.; secretary, Charles T. Ingham, Pittsburgh, Pa.; and treasurer, Edwin Bergstrom, Los Angeles, Calif. The executive secretary is Edward C. Kemper. Headquarters are in The Octagon, 1741 New York Ave., Washington, D. C.

ARCHITECTURE. The year 1935 was in many ways a discouraging one, although the amount of building was markedly greater than in the year before. Nevertheless, due to chaotic political and economic problems still unsolved, the production was most uneven in quality. Even along the lines of low-cost housing, where the promise was greatest, the results were generally disappointing; even in England the greater part of the tremendous production of small houses was utterly without any evidence of novel thinking—much less of architectural distinction. In Germany rows of tiny gabled houses, often without conveniences, set out monotonously on unstudied streets, were the rule; in France the H.B.M. (*Habitations à bon marché*) produced generally rather conventional and cramped types of French tenement, though exceptions to this are found. Italy's building efforts seem to have been chiefly along other and more monumental lines. The U.S.S.R., in spite of frenzied building of apartments and houses—many of which were well-planned along modern lines, hardly more than kept up with the enormous annual increase in population. In the United States the great promise of large Federal expenditure for the low-cost housing was pared down eventually merely to build a few "demonstration" units in different parts of the country. The question of adequate housing for a large section of the world's population was thus still entirely unsolved; and, unless legislators and governments generally adopted a much more realistic view of such matters as land values, costs, interests, and subsidies than is now apparent, it would continue unsolved. And in the meanwhile the building industry was working all over the world at a fraction of its capacity, while unemployment in the building trades was heavier everywhere than in any other comparable field.

The United States. The pouring of money into new Federal buildings produced more quantity than quality. The famous Washington Triangle reached substantial completion; its enormous bulk of concentrated office space not only complicated the already difficult traffic problems of the city, but also threw completely out of balance the great main Mall axis through the Capitol. Rich, built of beautiful materials, and majestic with classic

detail as they were, nevertheless as a whole they were so crowded that individual effect is lost; and the classic detail was in many cases so obviously useless, and applied with so little regard to function, that its majesty was severely compromised. Cret, in the Folger Shakespeare Library, and Goodhue, in the National Academy of Sciences, showed the possibilities of building in harmony with the older work in Washington, without ostentatious parade of applied classic forms that have lost their relevance to this age. Somehow, the more pretentious buildings of the Triangle produced even on many laymen the impression of a costume party. The parking problem for employees' cars was a terrific one, and a beautiful circular court—like that in front of the Post Office Department—necessarily loses in effect from being filled with the black tops of automobiles. The Building for the Department of Labor and Interstate Commerce was designed by the Supervising Architect's Office of the Treasury and Arthur Brown; the Post Office Department by Delano and Aldrich; the Department of Justice by Borie, Zantzinger, and Medary; and the National Archives Building at the narrow end of the site, a building undeniably impressive in its unbroken stone walls and monumental Corinthian portico, by John Russell Pope.

The new Supreme Court Building, by Cass Gilbert and Cass Gilbert, Jr., opposite the Capitol, was completed and opened.

Outside of Washington a much more creative spirit fortunately controlled Federal building. Thus the Philadelphia Post Office, by Tilden, Register & Pepper and the Supervising Architect's Office; the Post Office at Trenton, N. J., by the Supervising Architect's Office; the new San Francisco Mint, by C. S. Underwood; and the Minneapolis, Minn., Post Office, by Magnay and Tussler, were all examples of an extremely simple monumental style, distantly based on classic ideals, though without archaeological details, which was more and more becoming the accepted American manner for public buildings. It was even seen in Washington itself in the Central Heating Plant of P. P. Cret. Smaller post offices like those for Chicago designed by H. L. Cheney and J. C. Bollenbacher showed more informal types in the same general style.

The Wichita Art Institute, Wichita, Kansas, by Clarence Stein, was an interesting variation from the usual art museum, very simple, with a rich main entrance decorated with elaborate cast-stone ornament in color. The Prospect Park Zoo, Brooklyn, N. Y., by the New York Park Department architects under Aymar Embury II, was an interesting group in brick and stone that continued the high standard set in the Central Park Zoo, in plan, its greater area allowed a more interesting layout in a wide semicircle. The buildings built by the Indian Bureau of the Department of the Interior, designed by Mayers, Murray, and Philip, were remarkable examples of fresh design whose forms were allowed to grow naturally from the materials used and the local conditions. The Tribunal Council Group for the Navajo Reservation in Arizona, and the Hogan Day School for the Southern Navajo, showed virile and simple masonry forms; the Sawmill School for the Northern Navajo, with its bold use of timber, was strikingly different. Other public buildings worthy of notice were the Library at Cornwall, New York, by E. A. Matthiesen; the American Institute of Pharmacy Building, Washington, by John Russell

Pope; the Custom House Addition, Denver, Colo., by Buell and Mesick; and especially a remarkable Municipal Incinerator, Shreveport, La., by Jones, Roessle, Olschner & Wiener, which showed how pure function could, when rightly handled, produce a structure of marked and expressive beauty. The San Francisco County Jail, by Roller and Reidy, had something of the same direct simplicity, but its relation to its site was harsh and unorganic.

Of the year's hospitals, three stood out; the Miller Hospital, Duluth, Minn., by Ellerbe, Erickson & Co.; the additions to the Meadow Brook Hospital, N. Y., by John Russell Pope and W. F. McCulloch; and the great Los Angeles City General Hospital, by the Allied Architects Association of Los Angeles (Bergstrom, M. Hunt, Davis, S. Hunt, and Richards). The last was magnificent in its powerful, direct, expressive volumes.

Church design in America remained basically conservative. The Trinity College Chapel, Washington, D. C., by Murphy and Olmstead, used an early Renaissance type of decoration on a simple tile-vaulted interior; it was admirable in having no interior columns. St. Augustine's, Bridgeport, Pa., by Henry D. Dagitt and Sons, and the East Liberty Presbyterian Church, Pittsburgh, Pa., by Cram and Ferguson, were both Gothic. The last was one of the most lavish church buildings of recent years. Occupying with its parish house an entire block, the church group was dominated by a great central spire which rose magnificently in a series of decreasing vertical stages so that the whole had a generally spire-like outline. This tower was definitely original and struck a fresh note in modern Gothic design.

Discouragingly few schools or other educational buildings of other than strictly routine types were built during 1935. An exception was the Wyandotte High School, Kansas City, Mo., by Hamilton, Fellows, Nedved, and Radotinsky. This large group, though basically conservative in plan conception, was open, inviting, and much more airy than the usual high school. Much more important for the future of school design, however, were a number of recent schools in Los Angeles, especially those by R. J. Neutra. The Corona Ave. Public School, for instance, with its large glass areas and its pleasant breadth, recalled some of the best of the recent Dutch schools.

The most important competitions of the year were those for the Federal Reserve Board Building, Washington, won by P. P. Cret, and that for additions to the Art Institute, Chicago, won by Holabird and Root. It is noteworthy that this latter winning design was much the most "modern" of those submitted; it included a new façade of daringly simple vertical openings in the centre, flanked by lower, projecting wings treated with horizontal banded windows.

The continuation of financial uncertainty was particularly unpropitious for commercial and industrial building. The largest commercial structure completed was the International Building, Rockefeller Centre, New York, by Reinhard and Hofmeister, Corbett, Harrison, and MacMurray, and Hood and Foulhoux, associated. Its plan was in many ways a marked improvement over that of the main building; the entrance halls and corridors gave more sense of space and direction, and in general its use of materials and its lighting were both more imaginative. Its exterior sculpture, however, was most disappointing. Other interesting commercial buildings were the Remington-Rand Building in Washington, by Holabird and

Root; the Postal Life and Casualty Insurance Building, Kansas City, by E. W. Tanner; the East River Savings Bank Building, New York City, by Walker and Gilette; and the large, "windowless" Sears-Roebuck Store, Chicago, Ill., by Nimmons, Carr and Wright. Among industrial buildings, the Power Plant of the General Electric Company, Schenectady, N. Y., designed by the plant engineers, was revolutionary in cutting the amount of the building to an absolute minimum, leaving much of the machinery exposed in the open air; the effect is distinctly interesting. Another excellent and interesting structure is the Cashman Laundry Building, New York City, by Russell G. and Walter M. Cory.

The Federal Housing Administration seemed to have been eminently successful in stimulating house construction, and the financial recovery that was present in many industries undoubtedly aided as well, so that 1935 was a year in the United States of tremendous increase in the quantity of new domestic work. Much of it was, of course, purely speculative and purely conservative; advance in this type of work was limited strictly to the introduction of more and more gadgets to snare the wily customer—frequently at the sacrifice of real convenience of design and permanence of structure. As a whole, the entire real estate business was still completely cold to any creative innovations in either plan or style. Prefabrication was similarly frowned upon; although there were many large financial interests that were supporting studies along this line, the net results had not been too promising.

In the larger and more costly types of house, the turning to contemporary ideals in both plan and appearance was marked. For the first time these new and glittering houses, with massed windows, great window areas, roof terraces or flat roofs, and usually without ornament, were sufficiently common—especially in Southern California—to allow their evaluation on their real merits and not as curiosities. And any such evaluation must prove—at least to those not in love with some sentimental imagined traditional picture-house—that these new and contemporary houses are more airy, more convenient, more beautiful for us; and that they can be equally well designed to harmonize with any given landscape. Typical of this new acceptance of contemporary architecture was the award of the gold medal of the Better Homes in America annual competition to the Beard House, Altadena, Cal., by R. J. Neutra, remarkable for its simplified, open plan and its great window areas. Other houses somewhat similar in style were the Anna Sten House, Santa Monica, Cal., by R. J. Neutra; the Scheyer House, Santa Monica, Cal., by Neutra and Ain; the Taylor House, Berkeley, Cal., by M. Goodman, interesting for its use of oiled plywood as an exterior surfacing; and the extraordinary Oliver house at Los Angeles, by R. M. Schindler. Contemporary design of a less definitely stylistic type was widespread. Characteristic examples were the Jobyna Howland house, Beverly Hills, Cal., by Lloyd Wright; the Lefferts house, Wilton, Conn., by Evans, Moore, and Woodbridge; a week-end house at Redding, Conn., by Herbert Lippmann; the interesting Burnham villa at Michigan Center, Mich., by John L. Wright, built on a steep hillside; "Square Shadows," Whitemarsh, Pa., by George Howe; and the Enders house, Avon, Conn., by Talcott and Talcott. The two most interesting examples were probably the lavish Mandel Villa,

Mt. Kisco, N. Y., by Stowe and Deskey, using gracious curved forms in a manner recalling some of the best English work; and the unique house in Minneapolis, Minn., by Frank Lloyd Wright, exquisite in the simple directness of its plan and its knowing and beautiful use of materials.

Even in the majority of the houses built with no effort at stylistic modernity, the effects of the modern movement were evident in freedom of plan and treatment. Characteristic were California houses by John Byers, W. W. Worster, and Ralph C. Flewelling, and eastern houses by A. T. Remick, Charles Keefe, and especially the lovely Greek Revival or Directoire house at Peacock Point, Long Island, by Stevenson and Studts.

Of the various types of Federal relief housing, the resettlement and TVA villages were more interesting sociologically and economically than architecturally. Red House and Reedsville, West Virginia; Woodlake, Texas; Osceola, Kansas; and Crossville, Tennessee, were characteristic. Of the large urban groups which were financed through Federal loans, the most interesting were the Carl Mackley Houses, Philadelphia (for the Hosiery Workers Union), by W. Pope Barney and Kastner & Stonorov; and the Hillside Apartments, Bronx, N. Y., by Clarence Stein. T. H. Englehardt's Boulevard Gardens, Queens, N. Y., was more conventional. The Philadelphia group, comprising 284 apartments, was three stories high and attractively grouped around ample open spaces. Social facilities such as kindergarten, supervised play spaces, and a pool were included. Some controversy was caused by the government's insistence on such a high rental level to protect its investment that the project's usefulness to the group for which it was designed was seriously compromised. The Hillside Housing in New York was the largest of the projects, comprising nearly 5000 rooms, in 1416 apartments. Renting at an average of \$11 per room per month, it was obviously a "white collar" project. It consisted of buildings four to six stories high (the six-story unit having elevators), grouped around one very large and several small courts. Playgrounds, an auditorium, and workshops and clubrooms were provided, as well as indoor playing or kindergarten space. The plans were remarkable for the high proportion of units with cross-ventilation and the large size of the rooms. Exteriors were severely—perhaps unnecessarily—plain, but the planting of the courts (designed by Marjorie Cautley) was both practical and extremely effective. Although this group made no pretensions of hitting the problem of really low rentals (for New York \$6 per room per month is all that can be paid by at least a quarter of the population), it was technically perhaps the most advanced study in space utilization America had yet made.

The Federal Housing Administration had 49 projects approved as of Nov. 8, 1935. These may serve at least to demonstrate the possibilities of what a really large scale Federal housing movement might achieve. They have at least demonstrated that *without large public outright grants it is utterly impossible to build in America today to meet the low rentals much of our working population needs*. Naturally real estate interests were usually completely hostile to any such grants, or even to any realistic attack on America's pressing housing problem, and succeeded in having the amounts allocated for housing cut drastically from the original plan. For instance, New York City was originally to have \$45,000,-

000; this was cut to \$17,000,000, covering but two projects—Williamsburg, to contain 1625 units, and Harlem-McCombs Place, to contain 574. Of other approved projects, the largest were those for Boston, Chicago, Cincinnati, Cleveland, Indianapolis, and Memphis. The whole housing movement, which included a number of villages planned by the Resettlement Administration, was still further confused by increasing uncertainty as to the U.S. Supreme Court's attitude towards the problem. If the "general welfare" clause was to be interpreted as narrowly in housing cases as it was in the case of the AAA, it is possible the whole movement would be declared unconstitutional. The resulting chaos, with projects in various stages of construction, could be imagined. Senator Wagner, of New York, sponsored a bill to put Federal aid to low-cost housing on a firmer, continuing basis.

Great Britain. As in the United States, the most interesting building of the year has been public building or residence building. England, particularly, was enjoying a period of intense building activity which, but for its apparent basic soundness, might be termed a boom. And it was almost all building of which the general artistic level (outside of the speculative real estate field) was unusually high. Particularly noticeable was the large proportion of buildings for social advantage, like the large group of pithead baths and employees' facilities built in mining centres. The Pithead group at Sherwood, Notts., by A. J. Saise, was characteristic of the high artistic level reached. Other important work of permanent social usefulness included work at the Hendon Cottage Hospital, by Wallace Marchmont, simply handled in a modern brick and stone version of Georgian; the more conservative Foundling Hospital, Berkhamstead, by J. M. Sheppard; the Infants Hospital, Vincent Square, London, by Hall, Easton, and Robertson, with a lovely treatment, entirely novel, of shining metal-railed sun balconies; the Youth Hostel, Holmbury, St. Mary, by H. V. Lohb; the Talbot High School for Girls, Bournemouth, by J. H. Worthington, and the interesting swimming pool, Woodside Green, London, by R. J. Duke.

The two buildings of this class which best expressed the creative tendencies of present-day British architecture were the Pioneer Health Center, Peckham, by Sir Owen Williams; and the Bexhill Pavilion, by Mendelsohn and Chermayeff. The Peckham building, containing gymnasias, special exercise rooms, and a large swimming pool, was a magnificent example of Sir Owen's virtuosity in handling reinforced concrete and large glass areas; he was rapidly becoming one of the world's most important structural designers in his continuing imaginative exploration of the possibilities of new methods of building. The Bexhill Pavilion is a long, low building with those suave and gracious lines we should expect from Mendelsohn; it contained an auditorium, a library and reading room, and a hall fronting on a wide seaside terrace. Lubetkin and Tecton's Elephant House at the Whipsnade Zoo was an interesting composition of four large circular enclosures tied together with a broad cantilevered slab for a shelter.

The two best examples of government buildings of 1935 were the new Municipal Buildings at Dudley by Harvey and Wicks, and the beautiful group of Hornsey Town Hall by Reginald Uren. The latter was lovely in its simple fenestration and its strong high tower; it somewhat resembled

much modern Dutch work. In commercial work, outstanding examples were a Factory Administration Building at Birmingham, by Bye, Sims, and Gifford and S. T. Walker, associated, interesting in the contrast of long bands of glass with a curved projecting bay; the interesting and unconventional interiors of the motorship Orion, by Brian O'Rourke; and the Car Service Station at Catford, by C. Kirby.

The British system of government-assisted housing seemed to be working well so far as the production of houses was concerned. In the last 10 years a total of 1,232,076 living units (apartments or houses) were built with this assistance—809,000 by local authorities, the balance by private enterprises. About 17,000 units had also been built by local authorities without assistance. This figure of about 1,250,000 units compared with a total of 1,425,000 built by private enterprise unassisted during the same period.

Much interesting urban housing was completed during 1935. The London work included apartment groups in St. Pancras, by Connell, Ward & Lucas, interesting in its use of balconies; but the best examples were St. Andrews Gardens in Liverpool by L. H. Keay and the Smedley Point Group in Manchester by Leonard Heywood. The latter, an oval group stepping down a definite slope, was especially interesting, both in plan and appearance.

Many large apartment buildings for high rentals were built. Representative examples were Landsdowne House, London, by Wimpers, Simpson, and Guthrie; Dorset House, London, by T. P. Bennett and Son; Winchester Court, Vicarage Gate, London, by Martin Smith and Beswick, a beautiful design with a curved end and alternate areas of simple windows and recessed balconies; Cholmely Lodge, Highgate, London, by Guy Morgan, noteworthy for its curved plan along a diagonal street; and especially the High Point Flats, Highgate, London, by Lubetkin and Tecton, a lavish and beautifully handled example of the most advanced and unconventional design. Outside of London, the Palace Court Hotel, Bournemouth, by A. J. Seal and Partners, deserved notice; and Embassy Court, Brighton, by Wells Coates, was perhaps the best example of the advantages of contemporary design for a seaside resort hotel.

Of the great number of beautiful houses of the year, the following were especially successful: a concrete house at Hatfield, by F. R. Yorke; Kinrea, Esher Place, Surrey, by C. Barman; row houses at Plumstead, by Lubetkin and Tecton; a house at Chalfont St. Giles, by Mendelsohn and Chermayeff; and a house at Wentworth, by Oliver Hill.

The most important work in the British Colonies was the large building for the head office of the Hong Kong Shanghai Bank, at Hong Kong, by W. Wilson of Palmer and Turner. This was a tall, American-looking building, with stressed vertical lines; it was remarkable because of its windowless ground floor.

France. Despite financial depression, the amount of building in France continued large, much of it under local or central government auspices. Much school building, continuing the trend of the past two years, was rapidly making France a country of the best and most up-to-date schools, instead of one of the most backward. Especially interesting were the Open Air School at Suresnes, by Baudouin and Lods; and the Groupe Scolaire of Lyons, by Roux-Spitz. Other 'good educational

groups were the Lycée Camille-Sée, Paris, by P. Giroud; the École Nationale professionnelle at Vizelle, by Fournez and Sainsaulieu; and the Cité Scolaire of the École vétérinaire at Alfort, by E. Bois.

The best French public buildings were, as in England, buildings for popular use. Especially fine were the Municipal Swimming Baths at Bordeaux, by Madeline; the sport buildings at Dijon, by Parisot and Barade; the stadium "Suze" at Alfort, by Brillard de Laujardinière and Puthomme; and the "Plage" at Lys-Chantilly, by Tiercinier. All set a standard of gay and clean beauty that was worthy of wide emulation. Interesting also were the Maison du peuple, Belfort, by P. Giroud; the Strasbourg Y.W.C.A., by Jean Sorg; and the large and airy abattoir, La Villette, by Fournier, with a glazed concrete vault.

Of administration and other similar administration buildings, the best were the Paris Post Offices of the 5th Arrondissement and at the Parc des expositions, by Boileau and Azéma; the telephone office building in Paris by Débat-Ponsan; and the beautifully simple storage building for the Bibliothèque Nationale at Versailles, by Roux-Spitz. At Havre, the new Maritime Station for the transatlantic liners of the C.G.T., by Urbain Cassan, showed more careful study of circulation than of appearance; the new railroad station by H. Pacon combined both. Architects had, of course, a large share in the interior design of the great ship *Normandie*; Pierre Patout designed the great dining hall, and other interesting interiors were by de Boijen and Expert, and Pacon. Especially interesting were all-metal staterooms by Mme. Klotz and by R. Mallet-Stevens.

French churches, as in previous years, varied between the traditional and the functionally modern. The attempts at compromise between the two ideals were generally unhappily incoherent; the most interesting were the new church at Gentilly by Paquet and de Vasselot, of generally romanescque inspiration, and the domed church of St. Martin, Paris, by Liétard and Bouterlin.

Low-cost housing was being built on a large scale. Usually it took the form of apartment house groups near industrial centres. Notable was the work at the Cité de Charenton, by Maurey; at Sèvres, by Gutton and Ranfaing; at Le Plessis-Robinson, by Payret-Dortail; at Maisons-Alfort, by Hummel and Dubreuil; and at Colombes, by Tréant-Mathé and Champy. Ali Tur's apartments for the City of Paris were also excellent. Of larger apartments of high class in Paris, the best were those on the Avenue Dode de la Brunerie, by Ali Tur; on the Rue de Cevennes, by C. and H. Delacroix; and the apartment on a long narrow site on the Boulevard Victor, by P. Patout.

Private houses, like churches, seemed often still to be struggling between two conflicting ideals. The more progressive types were well shown in a beautiful house in Paris by C. & H. Delacroix, with a colonnaded roof terrace, and two villas by Le Corbusier and Jeanneret, one near Paris and the other on the Riviera.

Germany. The consistent development of German architecture away from creativeness to sterile sentimentality continued almost unchecked, except that in certain localities—notably the Hamburg district, the Ruhr and Rhenish cities, and, in part, the Stuttgart region—the contemporary, logical approach of the pre-Hitler epoch had become so deeply a part of the tradition that much work there in 1935 was still refreshingly logical and

imaginative. German churches also as a whole were exceptions to the usual sentimentality of the present architectural trend. Thus, the Gynecological Clinic at Stuttgart, by A. Schneck; the Iron Institute Laboratory at Dusseldorf, by P. Bonatz and Petersen and Köngeter; the open, simple, and airy office building in Cologne, by W. Riphahn; various houses near Altona, by R. Lodders; F. Schleifer's houses at Altona and, by exception, at Berlin; and some of the new houses at Stuttgart—these continued earlier advances in design. Similarly, St. Joseph's Church at Hindenburg, by D. Boehm, was interesting in its powerful use of great brick arches; the Protestant Church and Parish House at Stuttgart, by E. Leistner, and the church at Niederbomsfeld in Westphalia, by Wach and Roskotten, were both imaginatively and freshly conceived. Otto Bartning's Markus Kirche, at Karlsruhe, attempted to combine modern rectangularity with traditional forms, its apse was especially good.

The new trend away from all that the 20th Century means was well illustrated by the National Socialist School at Erwitte, built around a castle and decorated with all the old stage-set picturesqueness of high roofs and half-timber, designed by Görres, Kornowsky, and Koch; by the theatrically impressive Hindenburg Monument at Hindenburg, by W. & J. Kruger, built on the plan of a medieval castle, complete with a great court and massive towers; by a number of small Bavarian post offices; and by the rich and meaningless interiors of the Horst-Wesel-Haus in Berlin, designed by the Prussian State Architect's Office.

Of much rural housing, the best example is probably Ramersdorf, outside of Munich, by Guido Harbers. Here at least some attempt was made to give a coherent general plan to relieve the monotony of the tiny high-gabled houses.

Italy. Extravagant building of public buildings of all kinds, and of magnificent public works, continued in Italy. All of it was eloquent of a rather undisciplined but exuberant creativeness and vitality; little by little Italy was developing a vivid style of its own, a synthesis of two movements in earlier work, often conflicting but now harmonized—the movement towards a powerful but heavy neo-classic, and the movement towards pure functionalism. The imaginative and impressive new Post Office at the Lido-di-Roma, by A. Mazzoni, with its circular colonnade around a pool, was characteristic, as was, in a different way, the enormous garage at Venice. Many new buildings in the new town of Sabaudia bore witness to the same taste. They were by Cancellotti, Montuori, Piccinato, Scalpelli, Frezzotti, and Vicario. The Municipal Swimming Bath at Milan by L. Secchi had a most impressive concrete vaulted interior; and the new Elementary School in Trent, by A. Libera, was a most interesting group of novel yet logical forms. Good heliotherapy pavilions were built at Rome (in connection with the Foro Mussolini) by E. Del Debbio, and at Ispra, Lago Maggiore, by A. Mazzoni; Umberto Nardo's day nursery and home in Trieste was characteristic.

The old, neo-classic and neo-baroque manner still governed much memorial and church work. The Chapel of the Institute of the Sta. Corona, at Pietra Ligure, by P. Mezzanotte, was an example, as was the Funeral Chapel at Velletri, by A. Pettrignani. The most successful example was the Cimitero Monumentale del Grappa, by G. Greppi, with sculpture by G. Castiglioni, an impressive

MUNICIPAL INCINERATOR, SHREVEPORT, LA.

composition of low cylindrical stages, rising one above the other like a man-made hill. The same sort of neo-classic influence controlled in the large new group for the University of Rome, by Foschini, Aschieri, Michelucci, Capponi, Pagano, Ponti, and Rapiscardi, under the general direction of M. Piccentini.

The much discussed Railway Station at Florence, completed just at the end of the year, by Baroni, Berardi, Gamberini, Guarnieri, Lusanna, and Michelucci, showed, on the other hand, a predominance of the functionalist approach. Most interestingly composed of simple planes, with an admirable balance of vertical and horizontal motives, and excellently planned, it was one of the outstanding modern stations of Europe. Italian urban housing still remained disappointing in comparison with apartment design in Europe north of the Alps, but many private houses, large and small, ranked high as examples of 20th century domestic architecture.

Scandinavia. Architectural work in the Scandinavian countries continued its progress unabated; its quantity and its quality alike bore eloquent witness to the high standard of living that characterized them, and to the creative zest that seemed to accompany it. Especially important was the large amount of housing that continued to be built around Gothenburg and Stockholm in Sweden, as well as the growing number of single small houses, in attractive and accessible suburbs, built under municipal auspices. The best of the year's Stockholm apartments were the Kungsklippan and Kungsholmen, by Sven Wallender, and others by Einar Eriksson, by Walter Gahn, and by Sven Lind. All were direct, convenient, modern. The most original was the Kollektivhus, Stockholm—a long, narrow studio apartment building, with an interesting arrangement of sitting balconies and an unusually complete assortment of communal facilities. It was designed by Sven Markelius.

Danish work of 1935 was slightly more standardized than that of Norway and Sweden; the simplest rectangular patterning was the basis of most of it, and richness and variety was achieved by grouping and by the use of different materials. The new University Buildings at Aarhus, and the Aarhus Municipal Hospital, both by Fisker, Møller, and Stegmann, were characteristic; the same architects' large group of low-rental apartments in Stockholm revealed a similar kind of design. The large school at Kathrinedal, by K. Gottlob, was an impressive example of the lavishness of much current Danish school work. The Abattoir at Copenhagen, by Holsøe, was important.

In proportion to its population, the building in Finland was amazingly high both in quantity and quality. Finland has made contemporary architecture its own chosen style, and developed freedom within it, with a unanimity unequaled anywhere else. So generally high was the level of achievement that particularizing individual works was difficult. Characteristic and important works are: S. O. K. Building, Jyväskylä, by Aulanko and Rauhama; the Cooperative's Flour Mill, Vupuri, by Aulanko and Huttunen; the Sulphate Mill at Oulu, by Alvar Aalto; the important Helsingfors Fair Building, by Hytonen and Luukkonen; the impressive Town Hall at Kotka, by E. Huttunen; and the Vulcan Co. Match Factory at Aabo, by H. Wahlraas. Among the imaginative if sometimes eccentric Finnish churches, examples by A. Wilberg, O. Kallio, T. Paatela, and E. Pitkanen are worthy of notice. Important residential work includes the large store and apartment building in

Helsingfors by G. Juslen, the Helsingfors apartment house of M. Valikangas, and attractive private houses by E. Seppala and by Vaajakoski.

U.S.S.R. The large construction programme in the Soviet Union persisted; its quality was extremely variable. The desertion of functionalism as a basis had left Russian architects floundering in a strange morass of undigested "styles." The period was one evidently of frenzied experimentation. The lavish stations of the Moscow Metro illustrated this; they varied from such monumentally simple and impressive vaulted interiors as those of J. A. Fomin to the vulgar pseudo Renaissance of the Crimea Place Station by Kroutikoff and Popoff. In general there was in Russia more free expression of individual architects' ideals and less regimentation than almost anywhere else.

Of the more "modern" and functionalist work, the best was centred largely in Leningrad and the Ukraine; Moscow tended to more "classic" types. Le Corbusier's great building for the Ministry of Light Industries in Moscow, the "Centrosius," like the large building for the leather industry by Efimovitch, was of course in the most modern manner, but the new Moscow schools—characteristic examples are by Machinsky, Zvezdin, and Arkin—are chiefly in an amorphous pseudo-classic. The great Lenin Library at Moscow, by V. Stchouko, was expressive of the synthesis of classic dignity and richness with modern functional efficiency, which was the ideal the majority of thinking Soviet architects are aiming at. Eventually a new and characteristic style may grow from this, but in 1935 few architects seemed able to handle this synthesis as well as Stchouko does. The apartment house for the Siroff local Soviet in Leningrad by T. Trotsky, as well as his administration or borough hall there, were excellent; so was the direct expression of the social and recreational building of the Aviochun factory between Leningrad and Moscow, by N. Metlin. It was interesting to note that new buildings in villages and for communal farms generally followed traditional forms and techniques; naturally their plans were entirely different, with a definite attempt to raise living standards. Notable also was the attempt being made to stimulate local styles and traditions in Armenia and in Central Asia.

Other Countries. The depression had apparently brought almost to an end the building of low-cost housing in the Netherlands, and severely restricted other types. Notable achievements of the year were the new Boymans Museum at Rotterdam, by A. Van der Steur, and the new Hague Museum, the last work of the late T. Berlage. The former was carefully planned, effective in exterior design in an unforced simple style; the latter was more complicated, more obviously "modern," but less directly laid out. Both were characterized by carefully studied gallery planning and lighting that is said to make them in these respects the finest museums in the world.

The old leadership in daring and inventive design making the utmost use of new forms and materials that once was Germany's seemed largely in the hands of *Switzerland*. Representative works were the beautiful market hall at Vevey, by Tavernay, Schobinger and Getaz, with a parabolic vault 92 feet in span; the superb new laboratories of the Zurich Polytechnic School, by O. Salvisberg; the Zurich apartment house and restaurant by H. Schneider; and the lovely villa at Basel, by O. Salvisberg. Impressive also were the Infantry Bar-

racks and the superb new Art Museum at Lucerne, both by Armin Meili.

The great 1935 event in the architecture of *Belgium* was the Exposition at Brussels. Its general plan was a judicious blend of formal and informal, preserving a straight avenue, beautifully planted and lighted, as a main axis leading to a symmetrical permanent central building, the Grand Palais, by M. Van Neek, but with free and informal balance across the avenue. The most important Belgian Exposition buildings were, besides the Grand Palais, the Pavillon du Commissariat and the Pavillon de la vie catholique, both by H. Lacoste, and the Pavillon du Gaz, by M. Verwiltge. Good foreign buildings were the Paris Building by Azéma, the Metropolitan France Building by Montarnel and Cartier, the Italian Building by Libera and Renzi, the British Building by White and Robertson, the Colonial Building (in a romantic African type of design) by Schoentjes and Douret, and the Swiss Building by H. Hofmann.

Polish architecture was almost entirely in an erratic and angular contemporary style, often based on the most extreme so-called "functionalist" lines. Precedents—German or French—could often be traced, and the modern effect sometimes gave the impression of being a modernity adopted for stylistic rather than for natural reasons. The best was represented in the Central Institute for Physical Culture, Warsaw, by E. Norwerth, the rather Parisian-looking Patria Hotel, Krynica, by K. Pniewski, the Warsaw housing by J. Szanajca, the Gdynia Navigation School by Tomaszewski, and the country houses of L. Lubinski and Helena and Symon Syrkuv.

Czechoslovak architecture, equally modern, seemed more logical, more natural and "at-home," less forced. It was among the very best purely functional design yet produced, and worthy of careful study. Especially significant were the Pension Office by Havlicek and Honzik and the Offices of the Electric Utility Companies by Bens and Kritz, both at Prague, and the Brunn Students' Building by B. Fuchs.

Hungary selected a more exuberant and a more theatrical type of modern architectural expression. It was at its best in the houses of L. Kozma (one of the greatest living house designers) or of J. Fischer or M. Farkas. The churches, such as those of Gyula (by Rimanoczy) and Bertalan (by Arkay) were manneristic, powerful, but often disturbingly complex. *Turkey*, under the influence of Kemal's modernization, was rapidly developing a flourishing school of contemporary architecture, based largely on German inspiration. Ankara, the capital, was full of buildings that were like German work of 10 years earlier; the Office of the State Monopolies, by Tahir Tug, is characteristic. *Greece* was distinguished by its school building programme. The simple circular columns and flat planes of 20th century concrete seemed especially harmonious with the Greek tradition, and excellent use of them was made in the new schools at Amadalia, Athens, and Kallitheia by P. Karantinos.

The extraordinary economic development of the Jewish portion of *Palestine* has of course produced a flood of new building at Tel Aviv; the greater part of it is excellent 20th century work. E. Menkes's Villa-Sanatorium there is a representative example. The new architectural work of *Japan* was as modern and as closely based on the "International Style" as that of Central Europe; for in Japan, as in Greece, there was some basic harmony between the old traditional forms—logical

results of early construction methods, and new forms—logical results of new construction methods.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A federal republic of South America, consisting of 14 Provinces, 10 Territories, and the Federal District. Federal capital, Buenos Aires.

Area and Population. The area of Argentina is 1,079,965 square miles and the estimated population on Jan. 1, 1935, was 12,164,000 (12,030,000 on Jan. 1, 1934). Estimated populations of the chief cities (1934) were: Buenos Aires, 2,230,946; Rosario, 500,000; Córdoba, 280,000; La Plata, 200,000; Avellaneda, 160,000; Santa Fé, 135,000; Tucumán, 130,000; Bahía Blanca, 100,000; Mendoza, 80,000. Births in 1934 numbered 288,780; deaths, 134,340; marriages, 75,379; respective 1933 figures were 293,728, 133,207, and 70,337. During the period 1914-33, the urban population of towns over 2000 increased 73 per cent as against a 29 per cent increase in the rural population. The population is largely of Spanish and Italian origin. There are estimated to be less than 30,000 Indian aborigines.

Education. The voting population in 1930 had an illiteracy rate of 22 per cent, compared with 35 per cent in 1916, but in the capital only 2.6 per cent were illiterate. Primary education is free, secular, and nominally compulsory. In 1932 there were 11,545 primary schools, with 1,607,547 pupils; 232 secondary, normal and other schools, with 89,595 pupils; and 241 provincial secondary schools, with about 13,700 pupils. There are five national universities at Córdoba, Buenos Aires, La Plata, Tucumán, and Santa Fé (the latter having branches at Rosario and Corrientes), with a total of 20,000 students in 1932. In his message to Congress of May 15, 1935, President Justo announced that a committee of experts had made a survey of the educational system and submitted recommendations for the improvement of secondary and normal schools.

Production. Out of 5,018,000 gainfully employed persons in Argentina in 1933, 2,156,000 were in industry, 756,000 in agriculture, 381,000 in stock raising, 603,000 in commerce, 151,000 in transportation, and 971,000 in other professions. In 1934 there were about 197,688,000 acres of agricultural land, 269,349,000 acres of pasture, and 123,555,000 acres of woodland and forests. The estimated production of the chief crops in 1934-35, with 1933-34 figures in parentheses, was (in metric tons): Wheat, 6,486,000 (7,787,000); barley, 886,000 (784,000); rye, 401,000 (237,000); oats, 970,000 (833,000); cane sugar, 341,000 (315,700); linseed, 1,958,000 (1,590,000); cotton, 45,000 (43,400). The 1934-35 tobacco crop was 51,490,016 lb. (18,903,360 lb. in 1933-34). Corn production in 1933-34 was 5,901,000 metric tons; potatoes, 919,300 tons; wine, 200,150,000 gal (U. S.). Yerba maté, or Paraguayan tea, and quebracho extract, are other important products.

Argentina is one of the world's leading stock raising countries, the 1930 census showing 32,211,855 cattle, 9,858,111 horses, 44,413,221 sheep, and 3,768,738 swine. The 1934 wool clip was about 171,600 metric tons. Animals slaughtered in 1934 for the chilling, curing, and packing industries and in municipal and private slaughter houses included 6,002,000 cattle, 6,425,000 sheep, and 1,383,000 swine. The refrigeration and packing of meat for foreign markets is the principal industry; flour milling ranks second in importance. The production of textiles is increasing. Petroleum production in 1934 was 1,999,000 metric tons (1,951,000 in 1933). In 1933

there were 783 electrical distributing plants, which produced energy totaling 1,673,133,015 kw-hr.

Foreign Trade. Imports increased in value to 1,109,932,444 paper pesos in 1934 from 897,148,929 paper pesos in 1933, while exports totaled 1,438,028,969 pesos (1,120,841,512 in 1933). The favorable trade balance was 328,096,525 paper pesos, against a favorable balance of 223,692,583 paper pesos in 1933. On a tonnage basis, the 1934 imports were 6.2 per cent higher and the exports 10.7 per cent higher than in the previous year. The United Kingdom supplied 22.5 per cent of the 1934 imports (21.4 per cent in 1933); United States, 14.8 per cent (12.7); Germany, 9.7 (10.8); Italy, 6.2 (9.0). Of the 1934 exports the United Kingdom took 34.8 per cent (36.8 per cent in 1933); the Netherlands, 9.4 per cent (9.6); Belgium, 8.8 (10.2); Germany, 8.1 (7.7); France, 5.1 (6.4); United States, 5.1 (7.8).

Leading imports, by major classifications, in 1934 were (in 1000 paper pesos): Textiles and textile products, 275,668; fuel and lubricants, 161,708; iron and steel and their manufactures, 102,799; food products, 81,051; chemicals and drugs, etc., 72,112. Exports of agricultural products in 1934 were valued at 893,580,000 paper pesos (chiefly cereals and linseed), livestock products, 464,007,000 pesos (meat, 200,688,000; wool, 119,058,000; hides, 82,009,000); forest products, 42,432,000 pesos.

In 1935 general imports, excluding gold, totaled 1,175,000,000 paper pesos and exports 1,542,373,000 paper pesos.

Finance. The President's message of May 15, 1935, placed gross public revenues for 1934 at 903,300,000 paper pesos, including loans of 163,800,000 pesos, and the deficit, excluding loans, at about 1,000,000 pesos. The deficit for 1933 was 17,238,000 pesos, excluding loans, according to a report of the General Accounting Office. The accompanying table from the *Statistical Year-Book* of the League of Nations for 1934-35 shows the Argentine federal accounts for the years 1932 to 1935 on a different basis, with credit operations included. In October, 1935, Congress extended the 1935 budget through 1936.

ARGENTINE BUDGET OPERATIONS

[In millions of pesos]

Year	Receipts (incl. loans)	Expendi- tures	Deficit	Debt redemption (incl. in expendi- tures)
1932 ^a	807.6	935.8	128.2	94.7
1933 ^b	754.6	885.5	130.9	102.9
1934 ^b	809.0	980.0	171.0	.
1935 ^c	758.3	905.3	147.0	.

^a Closed accounts. ^b Closed accounts, provisional results. ^c Estimates.

Final budget returns for 1935 showed revenues of 1,246,066,531 pesos and expenditures of 1,254,544,000 pesos.

The Corporation of Bondholders placed the federal debt as of June 30, 1934, at 4,021,609,837 paper pesos. President Justo, in his message of May 15, 1935, stated that the debt as of Dec. 31, 1934, totaled 3,640,000,000 paper pesos. He announced a reduction in the unconsolidated debt from 1,208,000,000 pesos at the end of 1931 to 817,000,000 pesos on Dec. 31, 1934. The Argentine peso was equivalent at par to \$0.9648 in U. S. gold dollars and the paper peso was stabilized until late in 1933 at 44 per cent of the gold peso. On Jan. 19, 1934, the peso was linked to the pound sterling at the rate of 15 pesos to the pound, the rate for other currencies being calculated in accordance with their ratio to sterling. The gold standard was abandoned Dec. 16, 1929.

Communications. Argentina in 1934 had 24,675

miles of railway in operation, of which 5570 miles were state owned. In 1933 the railways carried 140,070,000 passengers and 38,500,000 tons of freight. Work on a railway line from Salta to Antofagasta, Chile, was begun in 1935. At the end of 1932 there were 6733 miles of good motor roads and 133,861 miles of unsurfaced highways. During 1933 and 1934, under the National Highway Law, 1427 miles of additional road were built (paved, 133 miles; improved earth, 108 miles; earth surfaced, 1186 miles). An additional 4252 miles were approved or under construction. Mail and passenger air lines link Buenos Aires with the chief Argentine cities and with the capitals of the Western Hemisphere. Construction of a \$3,283,000 airport in Buenos Aires was authorized in 1935. The net tonnage of vessels in the overseas trade entering Argentine ports in 1934 with cargo and in ballast was 10,295,000 (9,710,000 in 1933) and the tonnage cleared was 9,537,000 (9,673,000 in 1933).

Government. The Constitution of 1853 vests executive power in a president chosen for a six-year term by 376 electors representing the Provinces and the Federal District. The National Congress comprises a Senate of 30 members elected for nine years by the provincial legislatures and a Chamber of Deputies of 158 members elected for four years by universal male suffrage. The governors of the Provinces, elected by local suffrage, exercise extensive powers independently of the Federal Government. President in 1935, Gen. Augustin P. Justo, inaugurated Feb. 20, 1932. Vice President and President of the Senate, Dr. Julio A. Roca.

HISTORY

Economic Developments. The Justo Government successfully continued during 1935 the nationalistic recovery programme launched in the middle of 1933, and the end of the year found Argentina well on the road to economic prosperity. The recovery programme had four major objectives—restoration of a favorable trade balance, the opening up of new export markets, elimination of the unfavorable exchange situation, and encouragement of domestic manufacturing. The key agency in the operation of this plan was the Exchange Control Committee. With control of all foreign exchange transactions as a weapon, the government negotiated a series of bilateral trade agreements in which, in the main, foreign countries were obliged to buy as much from Argentina as Argentina bought from them. Imports from countries which declined to sign such agreements were in general restricted to the value of the exports they purchased from Argentina by curtailment of the amount of exchange made available for such imports. The government also succeeded in developing local industries to supply many articles formerly purchased abroad. Substantial expansion took place in the Argentine textile, glass, cement, furniture, shoe, paper, rubber, and moving picture industries.

In addition to these basic efforts, the government intervened in the economic field in many directions to cushion the effects of the world depression. The far-reaching legislation passed with this end in view in 1934 (see *NEW INTERNATIONAL YEAR BOOK*, 1934, p. 51-52) was supplemented in 1935 by other important measures. An important reform of the banking and currency system was carried out in March, 1935, through six decrees. A Central Bank and an institution for liquidating frozen bank credits were established, a new banking law promulgated, and modifications made in the organic laws of the Bank of the Argentine Nation and the National

Mortgage Bank. In general these measures were in line with recommendations made by Sir Otto Niemeyer of the Bank of England in 1932. A committee of four members, headed by the Minister of Finance, was appointed to put the financial programme into effect.

Simultaneously with the opening of the Central Bank early in June, the gold in the Conversion Office of the national treasury was revalued at 25 paper pesos per gold pound sterling (42,512.34 paper pesos per standard gold bar of 12.441 kilos). By this operation the 246,842,668 gold pesos in the Conversion Office, equivalent at par to 561,006,035 paper pesos, became equivalent to 1,224,417,646 paper pesos, thus giving the Government a profit of 663,411,611 paper pesos. An additional profit of 37,649,156 paper pesos was taken on the gold reserve against nickel and copper coins. The total profit of 701,060,767 paper pesos was used as follows: Transferred to Mobilizing Institute to permit it to pay banks for frozen assets taken over, 380,000,000; Government's subscription to Central Bank, 10,000,000; capital for Mobilizing Institute, 10,000,000, amortization of Government's debt to the Banco de la Nación, 150,000,000; payment of Treasury bills discounted by private banks, 139,471,822; deposit in the Central Bank, 11,588,945. Following the revaluation of the peso, money rates became easier, security prices rose slightly, and the exchange value of the peso increased as against other currencies. A decree modifying the Banking Act in important particulars was issued Aug. 12, 1935.

A Wine Regulating Board, empowered to restrict wine output to the normal requirements of the population, was appointed by the President, together with an advisory committee representing the banks, provincial governments, and organizations interested in the wine industry. The Board began operations with a fund of 30,000,000 pesos at its disposal. A National Cotton Board, to regulate the cultural, technical, and commercial phases of cotton production and manufacture, was likewise appointed in April. The cotton acreage in Northern Argentina had shown a 40 per cent increase in 1933-34 over the previous year. In his message to Congress of May 15, 1935, President Justo announced that a chain of grain elevators would be constructed with profits from exchange control operations. The sum of 110,000,000 pesos was allotted to continue the highway construction programme. The Federal Government continued during 1935 to meet interest and sinking fund payments on outstanding dollar bonds, but dollar bonds amounting to \$92,055,400 issued by the Provinces, Departments, and municipalities were in default as of Jan. 1, 1935.

Political Affairs. The struggle between the conservative government headed by President Justo, representing a powerful minority of large landowners, army officers, and business men, and the opposition Radical and Socialist parties reached the most violent stage since 1895 during 1935. By open force and fraud the government strove to prevent the Radicals from voting their majorities and thus regaining the power lost in the conservative revolution of 1930. Although it displayed marked Fascist tendencies, the government was attacked from the Right by the increasingly vociferous Fascist organizations, who formed a united front against both the government and the Left organizations in October. In a manifesto issued October 31 under the signature of Raimundo R. Meabe, a former member of the Uriburu revolutionary régime, the Fascists demanded the abolition of all political parties and the establishment of a corporative state. The Justo

Government thus occupied middle ground between the progressive and radical elements on one hand and the Fascists on the other. While ostensibly antagonistic to both groups, it was obviously more sympathetic to fascism than to the radicals, whose programme called for the abolition of the privileged position occupied by the landowning aristocracy.

Provincial elections during the year, commencing with that in Entre Rios in March, resulted in resounding Radical or Socialist victories wherever the voting was free from governmental manipulation. Accordingly the government resorted increasingly to the practice of replacing Opposition provincial authorities with Federal "interventors," or appointive governors with dictatorial powers, who usually saw to it that the government candidates won all elections. In Buenos Aires Province, where the overwhelming Radical electoral victory of 1931 was declared void by Provisional President Uriburu, the dictatorial tendencies of the Federal interventor provoked an uprising early in February, 1935. The Federal Government immediately suppressed the revolt and reinstated the interventor, Martínez de Hoz. The latter, however, in defiance of both President Justo and of the party which elected him, installed a Fascist cabinet and undertook to rule by frankly Fascist methods. With the approval of President Justo, he was impeached and ousted, Col. R. Marquez being appointed interventor in his place.

President Justo referred to the Fascist and radical menace in his message of May 15 to Congress. He urged legislation to purge the political parties of evils which he said caused the people "to lose faith in their leaders and, consequently, in our governing institutions." But with the approach of the national elections, scheduled for November, in which half of Congress was to be renewed, the President's supporters resorted to ever more violent methods to prevent the free expression of the popular will. This was in spite of the fact that the Radicals, who had boycotted the polls since the nullification of the election of 1931 in Buenos Aires Province, had been induced to participate in future electoral contests by the President's promise of fair elections.

An opening gun of the Opposition campaign was the charge that the Justo Government favored foreign meat packing companies in Argentina, and indirectly the landowners, at the expense of other producers and consumers. This charge, made in the Senate on July 23 by Sen. Lisandro de la Torre, leader of the opposition Socialist-Progressive coalition, was leveled specifically against Minister of Agriculture Duhau and Minister of Finance Pinedo. The bitter feeling aroused ended in a shooting affray in the Senate in which Sen. Enzo Bordabehere, an Opposition leader from Santa Fé Province, was killed and Minister Duhau and Deputy R. Mancini were wounded.

Another political storm was aroused by the government's decree of July 13 placing newspaper correspondents and news agencies in Argentina under heavy cash bonds and establishing a censorship of all outgoing news. The decree, declared unconstitutional by the Attorney General on August 20, was vigorously criticized by the Argentine press. It also stirred new radical fears of fascism, manifested by a great mass meeting of the Leftist parties in Buenos Aires in August to consolidate their united front against dictatorship.

In September, the government forced through Congress against strenuous opposition protests, a bill postponing until the second Sunday in March,

1936, the national elections scheduled for November. At the same time the electoral law was modified so as to favor government candidates. On October 3 President Justo ousted the opposition government in control of Santa Fé Province and appointed Manuel A. Alvarado, his Minister of Public Works, as interventor. Federal troops and gunboats were sent to the province to prevent a threatened popular revolt. The provincial elections held in Buenos Aires and Córdoba on November 3 were marked by even more flagrant fraud and violence. The *New York Times* reported that in many districts government police and armed civilians ousted Opposition poll watchers and prevented Opposition voters from approaching the polling booths. The Argentine press in general denounced the government's conduct of the elections, declaring that the ruling oligarchy had never before resorted to such flagrant frauds. Despite these methods, Opposition groups elected the mayor of the city of Córdoba and won many of the Buenos Aires election districts. These elections, marked by numerous shootings in which several persons were killed and many injured, were followed by a new outbreak in Córdoba Province on November 17, when eight policemen and a radical leader were killed during elections in the town of Plaza de Mercedes.

Strong criticism of the government's repressive policy continued in the Argentine press to the end of the year. On December 30 President Justo reorganized his cabinet in a form indicating his desire to conciliate the Radical party. He accepted the resignations of Federico Pinedo, Minister of Finance, Luis Duhau, Minister of Agriculture, and Manuel De Iriondo, Minister of Justice and Public Instruction, appointing in their respective places Roberto M. Ortiz, Miguel Angel Carcano, and Ramon S. Castillo.

Foreign Relations. Foreign Minister Saavedra Lamas of Argentina reaped the major share of the prestige accruing to the peace bloc, consisting of Argentina, Brazil, Chile, Peru, Uruguay, and the United States, for their successful negotiation of the truce of June 12, 1935, between Bolivia and Paraguay (see BOLIVIA under *History*). The holding of the peace conference in Buenos Aires was another triumph for the Argentine Government in its rivalry with Brazil and Chile for the political and economic leadership of the continent. An unusually violent demonstration of the mutual jealousy between Argentina and Chile occurred during March. Charges in the Chilean press that Argentina was responsible for continuance of the Chaco War were followed by a statement by President Alessandri of Chile, attributing the failure of the peace efforts to lack of cooperation between the Chilean and Argentinian Foreign Offices. Although the Chilean Government had shortly before announced an exchange of visits between Presidents Justo and Alessandri, the latter now declared that the time was not opportune for the Argentine President's proposed visit to Santiago. About the same time Augustin Edwards, former Chilean Ambassador to Great Britain, openly accused Saavedra Lamas of promoting Argentina's leadership in South American affairs at the expense of the continent's peace and harmony.

These hostile criticisms, which apparently were caused mainly by Argentine opposition to a new Chilean-Peruvian trade agreement, brought the two governments near to the severance of diplomatic relations. The incident was dropped, however, and Argentina and Chile soon afterward commenced joint negotiations with Bolivia and Paraguay,

which, with the support of the other American governments, brought the Chaco War to a close. The friendly relations between Argentina and the United States, restored through the diplomacy of Secretary of State Hull at the Seventh Pan American Conference in 1933, continued undisturbed during 1935. In opening the Pan American Commercial Conference at Buenos Aires on May 26, Foreign Minister Saavedra Lamas seized the occasion to eulogize President Roosevelt, Secretary Hull, and their "good-neighbor" policy. Political and commercial relations between Argentina and Brazil were further cemented by the state visit of President Vargas to Buenos Aires in May and June, returning the visit made to Rio de Janeiro by President Justo in 1933. A number of conventions were signed with Brazil, Chile, and Peru during the year.

Irked by the conclusion of the Peruvian-Chilean reciprocal trade treaty, which gave Chile an advantage over Argentina in the Peruvian wheat market, the Argentine Government on December 5 slapped an additional 50 per cent tariff duty on imports of petroleum from Peru. This action aroused new criticisms in Chile of Argentine "imperialism."

The notorious tardiness of the Argentine Congress in ratifying treaties negotiated by the government was partly responsible for further incidents along the Bolivian-Argentinian boundary. These events increased the mutual hostility of the two nations caused by veiled Argentine support of Paraguay in the Chaco War. A boundary treaty, signed in 1925, had been ratified by Bolivia and by the Argentine Senate but remained ineffective for lack of action by the Argentine Chamber of Deputies. This left in doubt the status of a stretch of frontier region in Jujuy Province and a considerable infiltration of Bolivians took place in territory claimed by both countries. Early in the year a Bolivian recruiting squad shot an Argentine citizen in this disputed region, provoking a vigorous Argentine protest. On September 19 the Argentine Senate held a secret session to consider charges that Bolivian authorities were administering some 2700 square miles of territory claimed by Argentina.

On October 21 the Argentine Government declared its adherence to the statute establishing the Permanent Court of International Justice, subject to Congressional approval. Despite the large Italian population in the country, which organized a boycott against British business in connection with the Italo-Ethiopian controversy, the Argentine Government complied with its obligations under the League Covenant by joining in the application of economic sanctions against Italy.

ARIZONA. Population. On Apr. 1, 1930 (Fifteenth Census), 435,573; July 1, 1934, by latest Federal estimate, 457,000; 1920 (Census), 334,162. Phoenix, the capital, had (1930) 48,118 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1935	156,000	125,000 ^a	\$7,762,000
	1934	136,000	117,000 ^a	8,159,000
Hay (tame)	1935	148,000	402,000 ^b	3,417,000
	1934	147,000	354,000 ^b	4,602,000
Wheat	1935	38,000	836,000	686,000
	1934	50,000	1,000,000	820,000
Corn	1935	40,000	720,000	612,000
	1934	35,000	490,000	519,000

^a Bales. ^b Tons

Mineral Production. The yearly yield of the mines of copper, gold, silver, lead, and zinc rose greatly in total value to \$36,269,000 for 1935, from

\$23,292,150 for 1934. As three-fifths of the recoverable gold mined in 1935 in Arizona and some two-thirds of the silver lay in ores mined principally for copper, the improvement in yield was shared by the three metals. The yields of lead and zinc, while much higher for 1935 than for 1934, accounted between them for less than \$1,000,000 of the year's total value in all five metals.

The mines' production of copper rose to some 270,500,000 lb. (1935), from 178,082,213 (1934); by value, to \$22,722,000, from \$14,246,577. The partial reopening of the United Verde mine in 1935 (it had closed in 1931) had much to do with the increase. The production of gold attained some 226,500 fine ounces (1935) as against 167,000 (1934); the value of the gold produced in 1935, at \$35 an ounce, was \$7,927,500. The yearly quantity of silver that was produced rose to 6,375,000 ounces (1935), from 4,448,474 (1934); the total by value, to \$4,704,750 (1935), from \$2,875,781 (1934).

Education. The Legislature restored in 1935 \$5 per capita of that part which had been cut, in the years of depression, from the State money apportioned to schools; some of the educational features that had been dropped by schools were revived. In common with many States, Arizona was active in developing alterations in the curriculum.

Charities and Corrections. Under the system of State administration in force in 1935 a Board of Directors of State Institutions exercised control over such of these institutions as had the care or custody of persons. Each institution had its superintendent, who was under the Board's authority. The Board had the Governor as its president and the State Treasurer as a member, both *ex officio*; an appointed secretary (in 1935, A. N. Kelley) completed its membership, acting as executive officer and institutional purchasing agent.

In 1935, having given up the committing of delinquent girls to the State School for Girls, the Board delivered such girls to the care either of the Florence Crittenton Home or of the Convent of the Good Shepherd in Phoenix. The institutions maintained by the State were: the State Prison, at Florence; State Hospital for the Insane, at Phoenix; Pioneers' Home, Prescott; State Industrial School, Fort Grant. The Board maintained a State reemployment office coöperating with the Federal Government.

Legislation. The State Senate adopted a memorial asking that the Federal Congress authorize an investigation into religious persecution alleged to be practised in Mexico. The legislature created a position of State's envoy, or agent, at Washington; the post was to carry a salary of \$7500 a year; its duties included the representation of the State government in the increasingly important relations with the Federal administrative agencies. The rate of the tax on retail sales was increased.

Political and Other Events. Governor Moeur's course (in 1934) of halting the construction of the proposed Federal Parker Dam in the lower Colorado River by use of a river boat and a detachment of the National Guard of the State to prevent access to the site on the State's bank of the river was supported by a decision of the Federal Supreme Court, rendered April 27. The construction of the Parker Dam, down stream from Boulder Dam about halfway to Yuma, was regarded as needful to the plan for the aqueduct to the Californian coast and also to the supply of water for the Imperial Valley. Arizona therefore felt its position in the contest for more water from the Colorado River to have been strengthened by the Supreme

Court's decision. The State authorities were reported in September to intend demanding 7,500,000 acre-feet a year of the water from the Boulder Dam, instead of the previously demanded 2,800,000.

The reorganization of the Maricopa County Municipal Water Conservation District No. 1, in default since Jan. 1, 1930, was completed in March, by aid of a loan from the RFC, the old bondholders becoming holders of debentures and income-bonds.

Officers. The chief officers of the State, serving in 1935, were: Governor, B. B. Moeur; Secretary of State, James H. Kerby; Attorney-General, John L. Sullivan; Treasurer, Mit Simms; Auditor, Ana Frohmiller; Superintendent of Public Instruction, H. E. Hendrix.

Judiciary. Supreme Court: Chief Justice, Alfred C. Lockwood; Judges, Henry D. Ross, A. G. McAlister.

ARKANSAS, UNIVERSITY OF. A coeducational State institution of higher learning in Tucson, Ariz., founded in 1885. The 1935 autumn enrollment totaled 2471; the registration for the summer session of 1935 was 469. The faculty numbered 185. The income for the year 1934-35 was \$1,083,382, the university receiving both Federal and State support. The library contained approximately 100,000 volumes. A new museum, humanities building, and women's building were under construction. President, Homer LeRoy Shantz, Ph.D., Sc.D.

ARKANSAS. Population. On Apr. 1, 1930 (Fifteenth Census), 1,845,482; July 1, 1934, by latest Federal estimate, 1,876,000; 1920 (Census), 1,752,204. Little Rock, the capital, had (1930) 81,679 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu	Value
Cotton	1935	2,140,000	890,000 ^a	\$50,062,000
	1934	2,162,000	867,000 ^a	53,031,000
Corn	1935	2,000,000	26,000,000	19,500,000
	1934	2,053,000	15,398,000	14,782,000
Hay (tame) ...	1935	598,000	580,000 ^b	6,496,000
	1934	610,000	507,000 ^b	7,301,000
Rice	1935	138,000	6,348,000	4,126,000
	1934	136,000	6,936,000	5,688,000
Potatoes . . .	1935	44,000	3,476,000	2,607,000
	1934	41,000	2,624,000	1,469,000
Sweet potatoes .	1935	28,000	1,820,000	1,274,000
	1934	27,000	1,620,000	1,442,000
Oats	1935	132,000	2,244,000	1,010,000
	1934	132,000	2,046,000	1,289,000

^a Bales ^b Tons.

Mineral Production. A new field of petroleum was discovered late in 1934. This area, called the Rainbow field, was found in Union County. Its development did not proceed far enough to have any great effect on the year's production of petroleum, which again declined, to 11,139,000 barrels for 1934, as against 11,686,000 for 1933.

More than nine-tenths of the United States' production of bauxite for 1934 came from Arkansas. The year's total for the State was 145,674 long tons, in value \$1,129,053. Arkansas was reported as becoming in 1934 a substantial though as yet a minor producer of mercury, to the quantity of 488 76-pound flasks. The output was from an area on both sides of the Little Missouri River in Pike County, discovered in 1931 to contain cinnabar and prospected in 1932. The area had not yet been thoroughly developed at the end of 1934.

Education. The inhabitants of school age, as reckoned for the academic year 1934-35, numbered 646,881. The enrollments of pupils in the public schools totaled 465,211, somewhat surpassing the total for the year before. Of the enrolled pupils,

407,204 were in common schools or elementary grades, and 58,007 were in high schools. The year's expenditures for public-school education throughout the State were estimated at \$10,500,000. This figure did not differ greatly from the total for the year before. The earlier year's average of teachers' salaries, \$489, was judged to have held with little alteration for the year 1934-35.

Legislation. The State's law prohibiting traffic in liquor was repealed. In its place the Legislature set up a system to limit and control sales, authorizing sale by the package by holders of licenses obtainable after payment of a fee expected to raise the State's revenue materially. Option, however, was allowed to counties, whether to exclude liquor. The new liquor law went into effect immediately.

A tax of 2 per cent on merchants' sales was enacted, with the intention of bringing in \$2,500,000 of yearly revenue, partly for the support of public schools. A system of pensions for the aged poor was created, with a view to enabling the State to obtain Federal contribution to such pensions. The Legislature showed a disposition to lend itself to a proposal of Secretary of Agriculture Wallace, that some State offer itself as a subject for the testing of Federal schemes to meet "the economic needs of the people," through accepting such schemes by referendum. It invited Wallace to submit his proposal to it, but he did not do this in person.

Political and Other Events. The State's sales tax, which went into effect on July 1, met with much opposition at the outset, from a group of merchants. These pledged themselves not to collect the tax from purchasers nor to pay it to the State. In the litigation over the tax, Chancellor Dodge granted, on October 30, a permanent injunction against its collection from sales of automobiles, except if the tax charge were in excess of the cost of the automobile license tag.

The State became the focus, in the spring, of disturbances attending the spread of the Southern Tenant Farmers' Union. Many Negro tenant farmers in Poinsett and Mississippi counties joined this union. Some of the landlords and their overseers exerted themselves to stop the movement. Violence cropped up, chiefly in the way of intimidation of union leaders and raids by "night riders" on Negro tenants' homes. The tenants' economic plight was bad, as the AAA had reduced their allowed acreage, along with that of other growers of cotton, whereby their credit at landlords' stores, being based on the acreages they cultivated, was automatically cut down.

Officers. The chief officers of the State, serving in 1935, were: Governor, J. M. Futrell; Secretary of State, Ed F. McDonald; Treasurer, Earl Page; Auditor, Charles Parker; Attorney-General, Carl E. Bailey; Commissioner of Education, W. E. Phipps.

Judiciary. Supreme Court: Chief Justice, C. E. Johnson; Associate Justices, Frank G. Smith, T. H. Humphreys, Thomas M. Mehaffey, Turner Butler, E. L. McHaney, Basil Baker.

ARKANSAS, UNIVERSITY OF. A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871. In the fall of 1935 the enrollment was 2104, and for the summer session it was 600. The number of faculty members was 224. The endowment amounted to \$132,000, while the income for the year was \$722,000. The library contained approximately 117,000 volumes. President, John Clinton Futrell, LL.D.

ARMAMENTS. See DISARMAMENT; MILITARY PROGRESS; NAVAL PROGRESS; FRANCE, GERMANY, GREAT BRITAIN, ITALY, JAPAN, and other countries under *History*.

ARMENIAN SOVIET SOCIALIST REPUBLIC. A republic of the Transcaucasian S.F.-S.R. of the Soviet Union. Area, 11,945 sq. miles; population (1933), 1,109,200. Chief towns: Erivan (capital), 111,500 inhabitants in 1933; Leninakan, 62,100; Nukha, 25,628; Lenkoran, 15,013; Kuba, 14,374; Karaklis, 11,222. In 1933 there were 202,000 students in the primary and secondary schools. Higher educational institutions numbered 9; technical schools, 64; and workers' faculties, 10.

The total area under cultivation in 1933 amounted to 1,047,280 acres of which 74,100 acres were under cotton. Fifty per cent of the farms were collectivized by Jan. 1, 1934.

ART EXHIBITIONS. Art exhibitions seemed to multiply in 1935 as sales decreased and the number of artists on relief grew larger. Countless exhibitions were held throughout the country to encourage local artists; innumerable traveling exhibitions were circulated by Art Associations; the annual exhibitions held by professional bodies at which many prizes were bestowed took place as usual, in addition to which were many very notable loan exhibitions and memorial shows held in Art Museums, dealers' galleries, and sales rooms.

That the circulating exhibition has become an important factor in the Art Museum's programme was again remarked, and also that the prevalence of loan exhibitions has put the world's greatest masterpieces "on the road." To such an extent was the exchange of such treasures carried in 1935 that the practice seemed to have become an instrument of international good will.

In Paris from May to September an exhibition of Italian Art comprising three hundred paintings from Cimabue to Tiepolo, sculpture, ivories, and laces, lent generously from great public collections by Italy and other nations, was held and very largely attended. That such an assemblage of the world's greatest masterpieces of painting will ever again be held under one roof seems improbable. In Venice a great exhibition of paintings by Titian, to which Spain made especially large contribution, was held during the summer months; while simultaneously at Parma a Correggio exhibition took place.

In London there was opened in November, 1935, to continue until March, 1936, under the auspices of the British and Chinese Governments the greatest exhibition of Chinese Art that has ever been held. To this exhibition, set forth in Burlington House, China, Japan, the United States, and European nations all made contributions. For the first time in history a battleship was used as a carrier of works of art. The British cruiser *Suffolk* brought from the Orient fifty million dollars worth of Chinese works of art for this exhibition and was accorded on arrival at Portsmouth, July 28, a royal welcome.

Museums of France including the Louvre, the Musée Versailles, the Théâtre François and private French collectors loaned their best to a "Survey of French Art" circulated in American Museums, an exhibition of "French Art of the 18th Century" held in the Metropolitan Museum and an exhibition of "Famous Women in French History" put on by the Museum of French Art in New York during 1935. To equally notable exhibitions abroad American Museums and collectors made valuable loans.

Exhibitions of foreign art, both old and modern, took conspicuous place in art events of 1935 in America. Outstanding was an exhibition of Paint-

ings by Frans Hals held in the Detroit Institute of Art in January in which about a sixth of all the works this master produced were shown as loans from American collectors. An important exhibition of Spanish Art was held in the Brooklyn Museum in October. Spanish Art and the development of art in the Southwest were emphasized by exhibitions held in connection with the California Pacific International Exposition in San Diego, California, in 1935.

Earlier in the year an exhibition of Soviet Art, consisting of 140 paintings and 250 prints, had a first showing in the Pennsylvania Museum, Philadelphia, and was later circulated, in part at least, among other museums. Arrangements for this exhibition were made through a Committee in Philadelphia of the Russian-American Institute, headed by Leopold Stokowski, the distinguished leader of the Philadelphia Orchestra, in cooperation with the Society of Cultural Relations with Foreign Countries of the U.S.S.R.

In the Museum of Modern Art, in the city of New York, two very noteworthy exhibitions were held in 1935—one of African Negro Art, sculpture in wood, bronze, and ivory, collected in Europe by Mr. James Johnson Sweeney, and set forth under his direction; the other of paintings and drawings by Van Gogh, one of the greatest of the modernists. The majority of the exhibits in the latter exhibition came from abroad and the total insurance carried was approximately one million dollars, which, in view of the fact that this painter received less than one hundred dollars by the sale of paintings during his entire lifetime, seemed to emphasize his life's tragedy. The attendance at this exhibition was very large.

A retrospective exhibition of paintings and drawings by Cecilia Beaux was held as a tribute to her genius and achievement by the American Academy of Arts and Letters in New York, opening on November 14 and continuing well into 1936. This comprised 45 paintings and 15 drawings, many of well known people, rendered with keen insight, sensitive perception, superb mastery of medium and excellent effect—a magnificent showing.

The Annual International Exhibition of Paintings held by the Carnegie Institute, Pittsburgh, in the autumn of 1935 included for the first time works by artists of South America, Mexico, and Canada, as well as heretofore, those of European countries and the United States. The first prize was awarded to a painting by a Spaniard, Hipólito Hidalgo de Caviedes, for a picture of a Negro boy and girl seated on a sofa. The second and third prizes went to American painters, Charles Burchfield and Henry E. Mattson. None of these works possessed beauty of content but they were less radical and storm provocative than those so honored the previous year.

The Biennial Exhibition of Contemporary American Paintings held in the Corcoran Gallery of Art in Washington in the spring of 1935 strikingly manifested present trends and confusion of ideals but was distinctly conservative as compared with the Annual Exhibition of current American Art set forth in the fall by the Art Institute of Chicago, which, according to the reviewers, was the worst ever held in that city. Director Harshe put the blame on the jury of selection; great dissatisfaction with the prize awards was expressed by some of the donors.

The Painting and Sculpture Section of the Procurement Division of the Treasury Department in October placed on exhibition in the Corcoran Gal-

lery of Art at Washington designs entered in competition for mural paintings in the new Post Office and Justice Buildings in Washington and other Federal Buildings throughout the United States, and models of figures in sculpture, mail carriers in historical sequence, to be placed in niches in the reception room of the Postmaster General.

An exhibition of paintings and drawings made in CCC camps under provision of the Government was first held in the National Museum in Washington and then circulated in units. One group was shown by special invitation in the White House.

Under the patronage of the Secretary of Labor exhibitions of paintings and sculpture by artists who had earned their living by manual labor were exhibited in the Labor Department. The first of these consisted of paintings by the late John Kane of Pittsburgh; later were shown paintings by Henry Bennet and George Haskell of Mount Holyoke, Mass., and sculpture in wood by Henry Geiger of Cedar Rapids, Iowa.

The Metropolitan Museum of Art, N. Y., held memorial exhibitions of paintings by Bryson Burrough, for many years curator of paintings, and of pottery by Charles F. Binns, for long one of our leading American potters.

To a notable exhibition of "The Sea and Ships," held in the Pennsylvania Museum, in November, the President of the United States, Franklin D. Roosevelt, lent several important items from his private collection.

Exhibitions of Persian Art were held in the Museums of Brooklyn and of Toledo; and, of Mexican Art in those of Cincinnati and Baltimore; of Classical Art in the Addison Gallery at Andover; of Chinese Art in Worcester; of 19th Century French Art in Kansas City, and of American Art of the 19th and 20th Centuries in San Francisco. The works of Pennsylvania furniture makers of early days were shown in the Pennsylvania Museum, and those by Connecticut furniture makers of Colonial times in Hartford. Early American portraits were featured by the Museum of Fine Arts, Boston.

An exhibition of one hundred paintings by American artists of to-day selected by Perry B. Cott, assistant curator of the Worcester Art Museum, was circulated in Museums and Art Galleries in Canada, South Africa, Australia, and New Zealand by the Carnegie Corporation of New York in 1935. To artists contributing to this exhibition a rental fee amounting to 1 per cent of the price, per month, was paid, and dealers lending received a flat fee of \$10 for each painting.

Exhibitions of Sculpture by Paulanship, and of Prints and Drawings by Percy Crosby, American artists, were shown in London in the summer of 1935—the former in the Tate Museum, the latter in the Arlington Gallery.

ART MUSEUMS. The announcement made in October, 1935, that the Hon. Andrew W. Mellon had set aside \$10,000,000 for the erection of a National Gallery of Art at Washington, to which he purposed to give his own magnificent collection of paintings by the old masters, was, with its far-reaching significance, sufficient to make this year outstanding. Stipulation was made in connection with this gift that the building should not bear the donor's name but be known as "The National Gallery of Art"; that only works of outstanding merit and quality should be permanently placed therein,

West Gallery

Opened in New York City, Dec. 11, 1935

ART MUSEUMS

and that the project should not be delayed beyond June 30, 1941. It was further revealed at this time that when Mr. Mellon conveyed the title to his collection, valued at over twenty million dollars, and including several world-famous paintings from the Hermitage collection, to an Educational and Charitable Trust, which he had set up, as announced in November, 1934, it was with the intention that it should form the nucleus of a great National Gallery to which it was his hope and belief that other collectors would make contributions. "The object of such a Gallery," Mr. Mellon stated, "should be the education of the people of the United States in the fine arts and the cultural advancement of mankind." His collection comprising 60 paintings of the rarest value was, he said, assembled by him during a long period of years with the idea that it would be made available to and become the property of the people of the United States.

Another munificent gift for the extension of art knowledge was that of a fund of approximately \$2,500,000 given by John D. Rockefeller Jr. to the Metropolitan Museum of Art, New York, for the erection of a building on a site donated by him in Tryon Park to take the place of the old Cloisters, purchased from George Gray Barnard, which would house most appropriately the Museum's Mediæval collections and the additions made thereto by himself over a period of years. Plans for the building, which will take the form of a Mediæval monastery, drawn by C. Collens, were exhibited at the time this announcement was made. This building will crown Washington Heights and splendidly exemplify the period for which it stands.

At the same time that this donation was made public a second and scarcely less generous gift from Mr. Rockefeller was announced by the President of the Metropolitan Museum of Art. This was a set of six French 15th century tapestries, "The Hunt of the Unicorn," formerly hung in the Château of Verteuil, the seat of the La Rochefoucauld family, and purchased by the donor 13 years ago for \$1,100,000. They will hang in the new Cloisters. Then in the late autumn of 1935 announcement was made that Mr. Rockefeller had purchased, for installation in the Cloisters, the chapter room of the Abbey of Pontaut—a very splendid acquisition.

In 1925 the Metropolitan Museum of Art became heir to Frank A. Munsey's entire estate; it was not, however, until January, 1935, that the beneficiary was able to announce the full amount of this beneficence. It was \$10,000,000, the greatest single benefaction received by the museum since its founding. The income from this fund, it was stated, made it possible for the museum to go through the years of depression without curtailment of activities.

Art Museums have profited indirectly but very materially by the Federal Government's relief measures and appropriations under which labor, and in some instances skilled service, became available without cost. Through substantial government aid of this sort, buildings for a State Art Museum in Richmond, Virginia, and for Art Museums at the University of Virginia, Charlottesville, the University of North Carolina and at Charlotte, North Carolina, were erected and practically brought to completion in 1935. The Museum at the University of Virginia, designed by E. S. Campbell, head of the Department of Architecture, colonial-classic in style, was opened in June. The State Museum at Richmond, a Georgian building of limestone and brick, to which the late Judge John Bar-

ton Payne left his art collection, \$100,000 for erection and \$50,000 as an endowment fund, was opened unceremoniously in October. An art museum, built in part through Federal Government aid, was opened in Wichita, Kansas, in September, 1935. Designed by Clarence Stein in the Spanish-Aztec-Indian style, this building is of cast concrete.

The Minneapolis Art Institute, in March, on the death of its president, John R. Van Derlip, and by his bequest, received a most valuable collection of rare and early European paintings, sculpture, and other works of art, besides, as his residuary legatee, a substantial sum for further acquisitions through purchase. These gifts were in memory of the donor's wife—Ethel Morrison Van Derlip. The collection was exhibited in the Institute in May.

The Brooklyn Museum made extensive physical changes and improvements in 1935, removing the monumental flight of steps leading from the street to its main entrance, creating new entrances on the ground floor, and (dispensing with its auditorium) a handsome entrance hall and a series of new galleries. The opening of these new galleries was inaugurated by a loan exhibition of Spanish Art.

On Jan. 18, 1935, the new San Francisco Museum of Art was formally opened. This museum with its 14 well lighted galleries is located on the fourth floor of the War Memorial building in the Civic Center adjacent to the Public Library and Opera House. It has no connection with the two San Francisco art institutions previously established—the M. H. de Young Gallery and the California Palace of the Legion of Honor.

On May 1 the Gallery of French Art in New York took possession of new quarters on the seventh floor of the Maison Française, Rockefeller Center, New York. These accommodations include not only a series of galleries but a roof garden terrace.

The Frick Art Reference Library, begun in 1920 by Miss Helen Frick, and now comprising 200,000 reference photographs, 45,000 books, and 18,000 sales catalogues, took possession, in January, 1935, of its own new building—a Renaissance structure erected, at a cost of \$850,000, from plans by John Russell Pope, architect.

The opening of the Frick Collection, housed in the Frick mansion in New York City, on Dec. 16, 1935, was one of the great events in art during 1935. It is one of the finest collections in the world assembled by a private collector, comparing with the Wallace Collection, London, and others equally famous.

John Russell Pope was also the architect selected by Lord Duveen to design the addition to the Tate Gallery of London given by him to the British Nation in 1935.

The Museum of Modern Art in New York received in May, 1935, a grant from the Rockefeller Foundation for the establishment of a department of motion pictures to be known as the "Museum of Modern Art Film Library." This institution immediately thereafter undertook to make as complete a record as possible of noteworthy moving pictures produced in this country and abroad from 1889 on, programmes of which it will circulate to art museums, associations, schools, colleges, and study groups, after the same manner as exhibitions.

The Art Museum at Worcester, Mass., was given by the Carnegie Corporation of New York, an additional grant of \$15,000 for the continuation of its Regional Art Education programme, initiated in 1932, under a grant of \$10,000 a year for three years from the same organization.

Almost all of the Art Museums increased their educational programmes in 1935 to meet the need for leisure-time occupation of the unemployed or part-time workers. Early in the year the Whitney Museum in New York inaugurated Wednesday evening openings. The Carnegie Institute, Pittsburgh, and the new San Francisco Museum were open every night; Cleveland Museum, three nights; Detroit Art Institute and John Herron Art Institute, Indianapolis, two nights, and Toledo Museum, Worcester Museum and Albright Gallery, Buffalo, each one night a week.

Childe Hassam, distinguished painter and etcher, who died in August, 1935, left by his will all the paintings, drawings, and prints in his studio to The American Academy of Arts and Letters to be sold to establish a fund for the purchase of paintings and prints, by artists of the United States and Canada, to be given to Art Museums in the United States and Canada.

In November, 1935, a collection of over five hundred prints by contemporary artists, chiefly of America, was given by the Chicago Society of Etchers to the Division of Graphic Arts, U.S. National Museum.

Two hundred and seventy-four etchings by George Elbert Burr of Arizona were given by an anonymous donor to the New York Public Library.

Mrs. John D. Rockefeller gave collections of paintings by modern artists to the Museum of Modern Art and Dartmouth College.

Through the bequest of Frank Brewer the Museum of Fine Arts, Boston, received 92 pieces of British silver. The Art Institute of Chicago and the Remington Museum, Ogdensburg, N. Y., each received 40 paintings through the bequest of Frederick T. Haskell. Fifty Renaissance paintings were given to Princeton University by an alumnus, Henry W. Cannon, Jr., in memory of his father.

Despite the paring down of administrative funds there were notable purchases made by Museums in 1935 for permanent collections, presumably from endowments for such purposes. Among the most important were the following:—"Portrait of the Poet Gongora" by Velasquez, "Portrait of Sir William Butts" by Holbein, "Portrait 16th Century French School" by the Museum of Fine Arts, Boston; "Lucretia" by Rembrandt, and "Triptych" by Daddi by Art Institute, Minneapolis; "Judith with Head of Holofernes" by Titian, and Portrait (probably Taddeo Gaddi) by Raphael by Art Institute, Detroit; "Madonna and Child" by Memling, Cleveland Art Museum; "Annunciation" by Giovanni del Biondo, Portrait bust—in plaster—of Mlle. Antoinette Schulte by Despiau, Albright Gallery, Buffalo; "Portrait of Girl" by Dubordieu, Chicago Art Institute; "Maisons a Anvers" by Van Gogh, "Peasant Woman Resting" by Pissarro, by Toledo Museum; "La Songeuse" by Renoir, two Gothic sculptures and Gothic glass window by City Art Museum, St. Louis; four miniatures from the Morgan sale, "Charles de Cosse" by Clouet, "Portrait of a Lady" by Hilliard, "Portrait of a Nobleman" by Isaac Oliver, and "Sir John Maynard" by John Hoskins, by the Metropolitan Museum of Art.

ART SALES. The sale in Christie's auction rooms, London, on June 24-27, of the John Pierpont Morgan collection of miniatures was not only the most notable sale of the year 1935 but of many years. Visitors swarmed the show rooms for days before the sale which was attended by representatives of Art Museums and private collectors from all parts of the world. This sale was successful

even beyond anticipation. The first session, June 24, was especially exciting for then the "Armada Jewel" and the portrait of Mrs. Pemberton by Holbein, two most famous items, came up. The former was purchased by Lord Wakefield for \$14,000, and later presented by him to the British Nation. The latter was secured by Lord Duveen for the record price of \$30,306, the highest figure of the sale, and more than double the price it brought in 1904. A few days later Lord Duveen turned it over to England for the price he paid, the purchasers being Lord Bearsted and the National Collections' Fund. Both of these treasures were deposited in the Victoria and Albert Museum. A portrait of Thomas More by Holbein, which, like the portrait of Mrs. Pemberton, was painted in gouache on a playing card, sold for \$4410. Other interesting items were "Portrait of Nobleman" by Isaac Oliver which sold for \$3215; "Portrait of Charles de Cosse" by Clouet for \$2700; "Portrait of the Duke of Monmouth" by Cooper, bought 20 years before for £70, sold for £735; "Portrait of Lady Hunsden" by Hilliard, bought at 55 guineas, sold for £252. "Henry VIII" by Holbein, sold in 1905 for 95 guineas, here fetched £525. Fifty-six portraits by Richard Cosway brought \$33,389 and 21 by Engelhart about \$1000. John Smart's miniature of Sir Charles Oakeley brought \$3008 and that of Lady Oakeley \$2800. The total for the four days' sale was \$340,651.

Earlier in the year, also with the desire to liquidate some of his assets, Mr. Morgan sold, through M. Knoedler & Co., at private sale, six oil paintings from his collection, receiving therefor \$1,500,000. These were a pair of portraits by Frans Hals, works by Fra Filippo Lippi, Ghirlandaio, Rubens, and Lawrence. The Rubens—a portrait of Anne of Austria—and the Fra Filippo Lippi triptych were purchased by the Metropolitan Museum of Art.

Several noted paintings in American collections were purchased by overseas collectors. Among these were Carpaccio's "St. Eustace" formerly in the Otto H. Kahn collection, and a Fra Angelico owned by Mr. Morgan, both of which were acquired by Baron H. Thyssen of Switzerland, and a series of panels, setting forth the St. Francis legend, by Sassetto, from the collection of Clarence Mackay, purchased by the National Gallery, London.

The Bles collection of English glass brought a total of \$20,000 when sold in London during the 1935 season. One item—a Royal Oak goblet—fetched approximately \$2850.

In Paris, in May, at the sale of the Seligmann collection a painting by Hals—"Les Petits Chanteurs"—brought \$40,000. In Leipzig a fine impression of Rembrandt's etching "Landscape with Three Trees" was sold for \$5000. The National Gallery at Melbourne, Australia, was reported to have paid over \$120,000 for two paintings by Velasquez.

Prices in this country were not as high as abroad. In June, reviewing the season then closing, the American-Anderson Galleries, New York, reported as significant the following sales:—"Singing Boys" by Hals and "Portrait of Lady Lister" by Gilbert Stuart, \$20,000 each; "Portrait of Sir Robert Liston" by Gilbert Stuart, \$10,500, "Le Cavalier dans la Campagne" by Corot, \$13,000. However, the total receipts, from the 68 sales for the season 1934-35, amounted to nearly three million dollars. This included art objects and some rare books as well as paintings and sculpture.

At a sale conducted by this firm in New York in October, 1935, American paintings of considerable note brought very low prices. For "Girl Crochet-

ing" by E. C. Tarbell, which, 20 years ago, was acquired at private sale for fifteen thousand dollars, at this sale brought only \$1800.

The demand for prints as well as for paintings was less in 1935 than formerly, and prices were lower, but a phenomenal record was made at exhibitions of etchings by John Taylor Arms held at the Kennedy Gallery and by Kerr Eby in the Grand Central Galleries, 62 prints being sold from the former and 59 from the latter.

ASTRID (SOPHIE LOUISE THYRA), QUEEN. The Queen of the Belgians was killed in an automobile accident near Kussnacht, on Lake Lucerne, Switzerland, Aug. 29, 1935. She was born in Stockholm, Nov. 17, 1905, the third daughter of Prince Charles, Duke of Vastergotland, brother of the King of Sweden, and niece of the King of Denmark. Her education was that of the average upper middle class Swedish girl, and she was taught the intricacies of housekeeping and cooking, as well as languages, music, and painting.

On Sept. 21, 1926, her engagement to Crown Prince Leopold of Belgium was announced by King Albert. The civil ceremony took place on Nov. 4, 1926, in the throne room of the royal palace in Stockholm, and six days later, the church wedding took place in the cathedral of St. Gudule in Brussels, a dispensation being required as the Princess was a Lutheran. On Oct. 11, 1927, Princess Josephine was born; on Sept. 7, 1930, Prince Baudoin, and on June 6, 1934, Prince Albert. On Aug. 5, 1930, Princess Astrid was received into the Roman Catholic Church by Cardinal van Roey in the Archbishop's palace at Malines.

At the death of King Albert of Belgium on Feb. 17, 1934, the Crown Prince ascended the throne, and Princess Astrid became Queen of the Belgians. Astrid, both as Princess and Queen, won the hearts of the Belgian people by her simplicity and kindness.

ASTRONOMY. Among the outstanding events in astronomy during 1935 was the discovery of the "forbidden" lines of chlorine by R. H. Stoy in the spectra of gaseous nebulae. These lines arise from the doubly ionized chlorine atom and lie in the green at 5538 and 5518 Angstroms.

Since Bowen's fundamental investigations in 1927, it has been known that the lines in the spectra of gaseous nebulae are mainly of the "forbidden" type—which are emitted only by an exceedingly rarefied gas. Now atoms of all sorts have ordinary spectral lines, but only a limited number of atoms (which have spectra more complicated than the average) can show forbidden lines; among the lighter atoms which can do so are carbon, nitrogen and oxygen, following which come silicon, phosphorus and sulphur. By removing an electron from the atoms fluorine is added to the first group in place of carbon, and chlorine takes the place of silicon; another ionization puts in neon and argon. A year or so ago neon was recognized in the nebulae by the presence of forbidden lines of its atoms, some with two electrons missing, some with four. More recently highly ionized argon has been detected in the same way.

The discovery of the lines of chlorine is of much interest since it is the first direct evidence of the

existence of chlorine in an astronomical body. All the first 30 elements in their natural order have now been identified in the depths of space. Those which remain unidentified are all rare on the earth, and good reasons are known why they should be hard to detect with the spectroscope. The last outstanding element of reasonable abundance was chlorine. Now at last it has been detected, and one more confirmation given to the conviction that the general composition of matter is everywhere the same throughout the universe.

Another important event was the discovery by Berman that the star R Coronae is a hot carbon star. There are two kinds of red stars, known as types M and N. The N stars characterized by an abundance of carbon and its compounds, the M stars by titanium oxide; M stars are about 100 times more numerous than N stars of the same apparent brightness, hence excess oxygen is the normal condition in a star, excess carbon rare. So long as the temperature is low enough to permit the formation of compounds in the stellar atmospheres, this distinction between "oxygen stars" and "carbon stars" is the most conspicuous of all spectral differences. For a long time this difference was sought for in vain in the hotter stars. The sun is an oxygen star.

Berman has recently made a very careful spectroscopic study of the remarkable variable star R Coronae. This is one of the strangest stars in the sky. Normally, for years at a time it is of the 6th magnitude with insignificant fluctuations. At irregular and quite unpredictable intervals it drops fairly rapidly to the 11th or even the 13th magnitude—only $\frac{1}{4000}$ th of its usual brightness. It may remain faint for a few weeks or for many months—then it returns to normal, usually more slowly than it faded. The spectrum at maximum is of class F7 on the Harvard System—not very different from our sun's except that it shows conspicuously the characteristics of a super-giant star. Like almost all other intrinsically variable stars it is of high luminosity—greatly exceeding the sun's (possibly when at its faintest it about equals the sun in luminosity). When the spectrum is compared in detail with that of an ordinary super-giant star such as Gamma Cygni, there are two important differences: The hydrogen lines are very weak, as has been noticed before; and a few faint lines of carbon in the blue, which are inconspicuous in ordinary stars, are here remarkably strong. By a detailed study of more than 600 lines Berman analyzed the atmosphere and determined the amounts of more than 20 elements which are present. For the metals the relative proportions are very similar to our sun's, but carbon is enormously more abundant and hydrogen less so.

A comparison with Gamma Cygni which being a highly luminous star is a fairer standard of comparison than the sun, shows that in Gamma Cygni the atmosphere is 99 per cent hydrogen and 0.5 per cent carbon, while in R Coronae there is 27 per cent hydrogen, 69 per cent carbon and 14 per cent of metals. R Coronae has a surface temperature of 5400°; a surface gravity $\frac{1}{4000}$ th of the sun's; a luminosity 1000 times the sun's; and a diameter of 20 or 30 million miles. Although this discovery of Berman's is very remarkable, R Coronae now being the hottest of known carbon stars, it should be remembered that some of the stars in which carbon is relatively rare have surface temperatures as high as 40,000°.

J. C. Duncan made some photographs of the well known ring nebula in Lyra with the 100 inch

telescope at the Mt. Wilson observatory after an aluminum coating for the telescope mirrors had replaced silver, and the photographs obtained show that this nebula has twice the diameter formerly supposed. Much of the radiation from the nebula is in the ultra-violet region of the spectrum. This radiation is invisible to the eye and is absorbed by silver, but strongly affects photographic plates and is reflected by aluminum.

Pannekoek and DeVerwey have calculated, from purely theoretical considerations, the widths of spectral lines of hydrogen. With a formula showing what proportion of atoms in a gas of given density would be exposed to electric fields of a certain magnitude, they computed the smearing effect upon various hydrogen lines; and assuming an atmosphere composed mainly of hydrogen they worked out the combined effect of absorption by layers at all levels, thus finding what the stellar line should look like. Separate computations were made for each of the four principal hydrogen lines, for different values of stellar temperatures, and for several values of surface gravity.

As it is known from atomic theory that the number of hydrogen atoms at work absorbing the red line is much greater than for the blue, while for the violet lines it is smaller still one might expect that the red line would be strongest and widest, and the others steadily weaker. But the Stark effect widening is greater for the blue and violet lines, and the net result of these two influences is to make all four lines almost equal in width; and measures of spectra show that they actually are. At very high temperatures, hydrogen is almost all ionized, and the four lines are weak.

Taking everything into account (including the influence of metallic atoms which are present) Pannekoek finds, for a value of gravity such as exists in Sirius or Vega, the lines should be widest at a temperature of about 8500° (which is probably not far from that of these stars). His curves, showing the width of the lines and the way in which the intensity should change from the centre toward the edge, agree remarkably well with measures of the lines in Sirius and Vega. Now the calculations were made on a basis of pure theory, making no use of any observed property of stars (save that their atmospheres were composed mainly of hydrogen). This agreement with observation is a noteworthy success in the interpretation of nature. The theory predicts precisely what the hydrogen lines in Sirius are like—and could have been worked out in the laboratory by men who had never seen a star.

An equally satisfactory result is the explanation of the abnormal behavior of hydrogen lines in stars of different brightness. If the force of gravity is a hundredfold greater on one star than on another of the same temperature, the formulas show the atmosphere of the first star will be so much hazier that the actual quantity of gas (per unit area) above the level to which one can see will be only one tenth as great as in the second. But the greater Stark effect in the first star will broaden the lines so much that they will be two and one half times as wide as in the other.

The greatest known force of gravity is found at the surfaces of white dwarfs. On the companion of Sirius it is about a thousand times as great as on the sun or on Sirius. One might expect that the hydrogen lines would be correspondingly widened and observation shows they are. However, the atmospheres of white dwarfs should be thin, containing much less material per square

mile, and this accords with the fact that the lines of metals are hardly to be seen in their spectra. Pannekoek concludes that, when the width of these lines has been accurately measured, astronomers may be able to calculate from this alone the force of gravity at the surface of a white dwarf, and thus get an estimate of its mass.

Kuiper has given many interesting particulars about the white dwarf A.C. + 70° 8247 which is, at present, the smallest star known. Its diameter is roughly half that of the Earth. Its surface temperature is $28,000^{\circ}$; and its distance from the sun is about one and a half parsecs. The average density of this star is about 36,000,000 times that of water. Thus, this star is not only the smallest star known, but also is the most dense. Its average density is about 90 times that of van Maanen's star, which has previously been the densest known object in the heavens.

The long-period variable R Aquarii presents a complicated sequence of phenomena which may include features of general astrophysical interest. Merrill has extensively described and discussed its composite spectrum, and compared it with the phases of other variable stars.

Vysotsky and van de Kamp have made an analysis of the proper motions of 18,000 faint stars. From their analysis they concluded that the sun's period of revolution about the galactic centre is 220,000,000 years, and the distance to the centre of rotation is 10.5 kiloparsecs. This result agrees quite closely with an independent study based on a different method of attack made by J. M. Mohr. Mohr concluded that the sun's orbit has an eccentricity of 0.08 and that the sun is now approaching perigalacticum and will reach apogalacticum in about 100,000,000 years.

Jekowsky has calculated the radius of each asteroid by taking its albedo to be equal to the average of those of Mars and Mercury and then considering the radius to be a function of the mean distance from the sun and the stellar magnitude of the asteroid. By plotting the radius against the number of asteroids, he concluded that all asteroids with radius greater than 60 km. have been discovered and that the maximum number of discoveries to-day is of asteroids with radius less than 30 km. The total number of asteroids is found to be 2334 and the total mass, assuming that all asteroids have equal mean density, is 6.4 times greater than the mass of Ceres.

The heavy numerical calculations involved in astronomical work, especially in Celestial Mechanics, are being strikingly transformed by the development of calculating machines, which have rapidly been displacing logarithms during recent years. The British Nautical Almanac Office has been completely mechanized by the adoption and modification of commercial machines to special problems—one machine has been constructed to compute automatically the Lunar Ephemeris. At Columbia University special machines are now in use for the rapid calculation of ephemerides of minor planets with special perturbations included; and under the direction of E. W. Brown, the Lunar Theory, on which Brown spent 20 years of computation, will be done over again in about one year.

The one hundredth anniversary of the birth of Simon Newcomb was celebrated this year. A memorial was unveiled at his birthplace near Wallace, Nova Scotia. Simon Newcomb was one of the three Americans elected to the Hall of

Fame of New York University at the eighth quinquennial election.

Phenomena. Comet 1935a (Johnson), discovered January 8, was the first new comet to be seen since 1933, thus ending an unusually long period with no comet discoveries. Three other comets appeared, including the first return of Comas-Sola since its discovery in 1926.

A minor planet 1935QN was discovered in declination +60°; the orbit is inclined nearly 39° to the ecliptic.

The year 1935 was remarkable for the series of eclipses which occurred. There was the maximum possible number of eclipses, viz., seven, of which 5 were solar and 2 lunar; this is a rare combination—usually when 7 eclipses occur, 4 are solar and 3 lunar. The last year with 5 solar and 2 lunar eclipses was 1805, and the next will be 2485. The small partial solar eclipse of Jan. 4, 1935, in the Antarctic was the 79th and last Saros recurrence of this eclipse; it now passes off the earth, having first occurred August 30, 528 A.D., Old Style, as a small partial eclipse in the Arctic regions.

ATHENS. See ARCHæOLOGY.

ATHLETICS. Track and Field. A one-man show, perfectly staged by Jesse Owens, Ohio State University sophomore, was the outstanding event of the 1935 track and field season, a season of preparation for the rush of an Olympic year in 1936. This young Negro, already a well established star, entered the Western Conference championships at Ann Arbor, Mich. in May and in the course of one sunny afternoon proceeded to shatter three world's records and tie a fourth in the four events in which he competed. He raced the 100 yards in 9.4 sec., equalling Frank Wycoff's mark set in 1930. He then moved over to the broad jump straightaway and leaped 26 ft. 8½ in., more than 6 inches farther than the Japanese star, Chuhei Nambu, had jumped when making the world's mark 4 years before. Jesse Owens then reported for the 220 yard dash final and sped down the track in 20.3 sec., two tenths of a second faster than Roland Locke's standard set in 1926 and a tenth of a second speedier than Ralph Metcalfe's internationally unrecognized collegiate mark. And for a climax, Owens, a novice at hurdling, raced over the 220 yard route of low hurdles in 22.6 sec., eclipsing the 11 year old mark of Charley Brookins as well as all collegiate marks. All of Owens' Western Conference marks set that day at Ann Arbor were duly recognized by the Amateur Athletic Union when that body met in New York late in December.

Owens proved his greatness by winning the four events again in the Central Intercollegiate meet and later, on the Pacific Coast made another four-sweep at the N.C.A.A. championships. But, at the

National A.A.U. meet at Lincoln, Nebraska, in July, Owens fell before Eulace Peacock, a Negro performer from Temple University, in both the 100 yard dash and in the broad jump and these two Negroes, along with Metcalfe, who split them in the 100 yard final at Lincoln, loomed as sure-fire bets for the United States Olympic squad at Berlin.

Aside from Owens' record smashing burst, the record shattering of the year was fairly mild in comparison with the preceding year. Keith Brown of Yale set a new pole vault mark of 14 ft. 5½ in.; Norman Bright set an American 2 mile record of 9 min. 13.2 sec.; and Roy Staley, Leroy Fitzpatrick, Phil Cope, and Tom Moore, all Californians, returned 14.2 sec. for the 110 meter, or 120 yard, high hurdles.

Once again mile running was the feature of the outdoor as well as indoor campaigns, with Glenn Cunningham again in the rôle of star. The Kansan was supreme indoors, with his 1934 rival, Bill Bonthron never able to recapture his old speed. But in the final of the season, at Princeton, Cunningham fell before the style and speed of Jack Lovelock, the New Zealander, who beat Cunningham and Bonthron in 4 min. 11.2 sec.

The United States quarter milers again were superb, with young Eddie O'Brien of Syracuse and Jimmy Luvalle of U.C.L.A. the standouts. O'Brien, a newcomer to the sport, won the National A.A.U. 400 meters at Lincoln and later toured Europe without suffering a defeat. Luvalle, Intercollegiate A.A.A.A. and N.C.A.A. winner, beat O'Brien by a stride in the former meet in 47.3 sec., but that was before the Syracusan settled into his all-winning stride.

The New York Athletic Club squad, headed by Percy Beard, the hurdler, O'Brien, Joe McCluskey, the long-distance runner, and Horace Odell, javelin thrower, won the National A.A.U. indoor and outdoor team titles. The University of Southern California took both the Intercollegiate A.A.A.A. and N.C.A.A. team honors and Manhattan College won the indoor intercollegiate.

Miss Helen Stephens, newest sprint sensation among the women, turned in the only notable achievement of the women's season when she defeated the mighty Miss Stella Walsh indoors and outdoors and shattered most of the existing women's records.

ATOMIC NUCLEI. See CHEMISTRY

ATTERBURY. GEN. WILLIAM WALLACE. An American railway official, died in Philadelphia, Sept. 20, 1935. Born at New Albany, Ind., Jan. 31, 1866, he was graduated from the Sheffield Scientific School, Yale University, in 1886. In that year he became an apprentice in the Altoona shops of the Pennsylvania Railroad, and three years later was made a road foreman on various divisions of the line, being promoted to assistant engineer of motor power of the Northwest System of the Pennsylvania Line in 1892. A year later he was appointed a master mechanic of the Pennsylvania Company and stationed at Fort Wayne, Ind. During the strike of the American Railway Union in 1894 he kept the Western Division of the Line open by running the first train through, and later was successful in disentangling a traffic snarl in Pittsburgh, being rewarded with the post of general superintendent of motive powers on the lines east of Pittsburgh and Erie in 1896. In 1903 he became general manager, and in 1909 was elected fifth vice president in charge of transportation. Two years later he was advanced to fourth vice president,

subsequently becoming vice president in charge of operations.

In 1917, after the United States had entered the War, General Atterbury was asked to take charge of the problem of railroad transportation in France. He accepted and served until 1919, being rewarded with the rank of brigadier-general and the Distinguished Service Medal, as well as decorations from the British, French, and Belgian governments. To erect a railroad system distinct from that of the French railways was one of his tasks and before the end of the War he had built 800 miles of railroad, constructed miles of docks and quays, and had succeeded in linking the English Channel with the Western Front. Fifteen hundred locomotives were operated on this line, 20,000 freight cars were hauled, and a staff of 70,000 was employed.

Upon his return he rejoined the Pennsylvania Railroad, as vice president and in 1925 was elected to succeed Samuel Rea as its president. During his incumbency the electrification of the system running south to Washington began. When, in 1927, the question of running an air transport system in connection with the railroad was brought up, he was skeptical, but a year later changed his views, and the Pennsylvania Railroad became part owner of the newly-formed Transcontinental Air Transport, Inc., of which Col. Charles A. Lindbergh was chosen consulting aeronautical engineer. Under the General's guidance the Pennsylvania made rapid strides, and in 1929 the net operating income rose to \$133,000,000. When faced with the loss of revenue caused by the country's industrial depression, a vigorous policy of retrenchment was the Company's course. In 1932, money was borrowed from the Reconstruction Finance Corporation in order to finance special projects, such as the further electrification of the line, and in 1934, a loan for \$77,000,000 was obtained from the Public Works Administration to be used for furthering the betterment of the road. In April 1935, General Atterbury, having been inactive on the Company's behalf for almost a year, retired.

In 1916, while serving in the capacity of president of the American Railway Association, to which office he had been elected, Atterbury rendered aid to the Government by transporting troops and supplies to the Mexican border. In 1934, when the Association of American Railroads was formed, he was made a member of the board of directors. General Atterbury was honored by several universities, including Yale and Pennsylvania, and was active in many corporations and societies.

AUSTRALIA. A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra.

Area and Population. The area of the six States and two Territories, the census population of June 30, 1933, and the estimated population on June 30, 1935, are shown in the accompanying table.

AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in sq. miles	Population	
		June 30, 1933	June 30, 1935
New South Wales .. .	309,432	2,600,847	2,644,760
Victoria	87,884	1,820,261	1,837,966
Queensland	670,500	947,534	967,947
South Australia	380,070	580,949	584,815
Western Australia	975,920	438,852	445,692
Tasmania	26,215	227,599	228,728
Northern Territory	523,620	4,850	5,111
Federal Capital Territory	940	8,947	9,286
Total	2,974,581	6,629,839	6,724,305

During 1934 births numbered 109,475 (111,269 in 1933); deaths, 62,229 (59,117 in 1933); and marriages, 51,465 (46,595). A total of 53,704 persons entered the country in 1934 and 51,424 departed. The estimated populations of the chief cities (all of them State capitals) on Dec. 31, 1934, were: Sydney, 1,249,040; Melbourne, 1,000,000; Brisbane, 304,930; Adelaide, 313,778; Perth, 208,448; Hobart, 60,500. The population of Canberra was 7500.

Education. Primary education is free and compulsory. In 1932 there were 72 kindergartens, with 3895 pupils, 10,246 State schools, with 934,075 pupils; 1820 private schools, with 220,723 pupils; and six State Universities (at Sydney, Melbourne, Brisbane, Adelaide, Perth, and Hobart), with 9942 students.

Production. The estimated value of production, by industries, for the fiscal years ended June 30, are shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED JUNE 30 [In thousands of pounds sterling]

Item	1932	1933	1934
Agricultural	£ 74,489	£ 75,562	£ 70,700
Pastoral	61,540	64,851	95,600
Dairy, poultry, bee-farming	41,478	39,622	40,300
Forestry and fisheries	7,703	8,470	9,400
Mining	13,352	15,583	17,600
Manufacturing * ..	106,456	114,136	121,800
Total	£ 305,018	£ 318,224	£ 355,400

* Value added in process of manufacture.

A total of 22,454,327 acres were under crops in 1933-34, of which 14,901,271 acres were devoted to wheat. The wheat crop in 1934-35 totaled 133,488,616 bu. (177,337,803 bu. in 1933-34). Other crops in 1933-34 were: Oats, 16,922,031 bu.; corn, 7,494,080 bu.; hay, 3,582,748 tons; sugar cane, 4,898,040 tons. The estimated production of cane sugar in 1934 was 660,000 tons. The number of sheep in Australia in 1934 totaled 114,099,496. The wool clip for the year ended June 30, 1935, totaled 970,000,000 lb. (914,000,000 lb. in 1933-34) and sales for the year totaled £38,526,025 (£52,165,778 in 1933-34). Other livestock (1933) included 13,512,487 cattle, 1,749,040 horses, and 1,046,867 swine. The production of butter in 1933-34 was 450,936,428 lb.; cheese, 38,476,493 lb.; bacon and ham, 71,490,279 lb.

The value of mineral production increased to £20,025,586 in 1934 from £17,607,968 in 1933. The principal minerals, with their values in the calendar years 1934 and 1933, respectively, were: Gold, £7,536,674 (£6,406,061); silver and lead, £2,922,685 (£2,570,274); copper, £397,118 (£531,152); tin, £730,867 (£540,331); coal, £6,303,170 (£5,975,900). In 1933-34 there were 23,297 industrial establishments in Australia, with 405,909 employees and an output valued at £330,134,060 (£129,091,915 exclusive of the value of materials used). In 1932-33 the total manufactured output was valued at £304,797,868 and the value added in process of production was £119,203,148.

Foreign Trade. The trend of Australian for-AUSTRALIAN FOREIGN TRADE, YEARS ENDED JUNE 30TH [British currency values]

	Imports	Exports *	Balance
1929-30	£131,081,320	£125,127,148	£ - 5,954,172
1930-31	60,959,633	89,325,968	+ 28,366,335
1931-32	44,712,868	85,348,607	+ 40,635,739
1932-33	58,013,860	96,597,225	+ 38,583,365
1933-34	60,712,926	98,572,632	+ 37,859,706
1934-35	74,126,586	90,042,228	+ 15,915,642

* Including reexports.

eign trade during the course of the world economic depression is shown in the accompanying table. The figures include merchandise, bullion and specie.

In Australian currency values, exports amounted to £120,943,317 in 1932-33, £123,441,209 in 1933-34, and £112,756,978 in 1934-35. The value of the principal exports (Australian currency values) in 1934-35 was: Greasy wool, £34,208,191; scoured wool, £5,047,884; wheat, £11,612,357; butter, £9,586,776; gold, £9,816,598; wheat flour, £4,607,383; lamb, £3,515,230; beef, £2,547,342; lead, £2,415,392. Textiles, tea, olive oil, iron and steel, automobiles, machinery, printed matter, etc., are the leading imports.

Finance. For the fiscal year ended June 30, 1935, total revenues of the Federal government, including postal receipts and government enterprises, were £77,369,105 and total expenditures were £76,657,900. Returns for the previous fiscal year were: Receipts, £73,941,953; expenditures, £72,640,383. The budget estimates for 1935-36 placed receipts at £77,700,000 and expenditures at £76,628,000, the anticipated surplus being £1,072,000.

The six State governments budgeted for a deficit aggregating £5,524,000 in 1934-35, but the actual deficits totaled £3,765,000. South Australia realized a surplus of £36,000. During the same period the States made payments aggregating £4,600,000 into sinking funds. The Commonwealth public debt on June 30, 1935, totaled £394,151,070 and the aggregate debt of the States was £847,963,751, making a total of £1,242,114,821. Of the latter total £650,093,181 were held in Australia, £546,456,963 in London, and £45,564,677 in New York. The aggregate debt of the Australian municipalities on June 30, 1935, was £85,456,221.

Communications. Federal and State railways open for traffic on June 30, 1934, had 27,130 miles of line; private railways, 847 miles. For the year 1933-34, the government railways reported gross earnings of £37,295,000 and working expenses of £26,916,000. Highways, mostly under State and local control, aggregated about 330,000 miles. There were 455,199 passenger cars and 116,341 motor trucks in Australia in 1934. Air routes in operation on June 30, 1934, extended 8090 miles. There were on the same date 130 public airdromes and 334 landing fields. Air mail service between Australia and London by way of Singapore was inaugurated on Dec. 10, 1934, and the line was opened to passengers in March, 1935. A weekly air service connecting Adelaide on the south coast with Darwin on the north coast was announced in 1935. The net tonnage of vessels entering the ports with cargo and in ballast in the overseas trade during 1934 was 5,353,000, tonnage cleared, 5,411,000.

Government. Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (six from each State), elected for six years, and a House of Representatives of 74 members apportioned among the States on a population basis. The appointment of Sir Alexander Hore-Ruthven to succeed Sir Isaac Isaacs as Governor-General was announced in August, 1935. The composition of the House of Representatives following the election of Sept. 15, 1934, was: United Australia Party, 32; Country Party, 15; Federal Labor Party, 18; Lang Labor Party, 9.

The cabinet appointed Nov. 7, 1934, represented a coalition of the United Australia and Country

parties. Members of the cabinet were: Prime Minister and Treasurer, Joseph A. Lyons; Commerce, E. C. G. Page; External Affairs and Territories, Sir G. F. Pearce; Attorney-General and Minister for Industry, R. G. Menzies; Vice President of the Executive Council and Minister for Health and Repatriation, W. M. Hughes; Defense, Archdale Parkhill; Interior, T. Patterson; Trade and Customs, T. W. White; Postmaster-General and Minister Controlling Development and Science and Industry, Senator A. J. McLachlan.

HISTORY

Internal Developments. The steady economic recovery inaugurated in Australia in 1933 continued during 1935. Although the value of exports declined in the 1934-35 fiscal year, most other business indices were favorable. The advances recorded in agricultural prices, railway earnings, and employment had a favorable effect on Federal and State budgets and on special relief requirements. Factory employment in 1934-35 reached an all-time record. Unemployment among trade union members in the third quarter of 1935 was 15.9 per cent, compared with 20.4 per cent in July-September, 1934. The last quarter of 1935 was marked by satisfactory crops, relative labor tranquility, a broad increase in export prices, and the maintenance of good business volume, particularly in manufacturing and construction.

In his budget speech before the newly assembled Federal Parliament on September 23, Prime Minister Lyons proposed slight reductions in emergency taxation as a result of the 1934-35 budget surplus (see *Finance*) and the continued favorable trade balance. A cut in the special property income tax from 6 to 5 per cent and a lower excise on tobacco were proposed, together with further withdrawals of the drastic salary cuts imposed upon Cabinet ministers, members of Parliament, and other civil servants.

The friction between the Federal and State governments over the distribution of loans—one of the major sources of irritation which led the Premiers of Western Australia, South Australia, and Tasmania to warn the Commonwealth in 1934 that their States might secede if the Federal Constitution were not revised—was again evidenced during the meeting of the Australian Loan Council in May. The Council, established a decade earlier to eliminate competition in the loan markets among the State and Federal governments, agreed upon loans of £31,000,000 during 1935-36, to be spent largely on public works. The public works fund was divided as follows, after a heated debate marked by Victoria's strenuous protests at the larger sum allotted to New South Wales: Commonwealth, £5,750,000; New South Wales, £8,000,000; Victoria, £4,000,000; Queensland, £3,000,000; South Australia, £2,100,000; Western Australia, £2,600,000; Tasmania, £600,000.

Western Australia's efforts to secede from the Commonwealth, in compliance with the mandate received by the State officials in the 1933 referendum, met another obstacle in 1935. Rejected by the Commonwealth Government, the secession petition had been presented to the British Parliament in December, 1934. On May 24, 1935, a parliamentary Joint Select Committee reported that under the Statute of Westminster the Imperial Parliament had no authority to intervene in the internal affairs of a Dominion unless specifically requested to do so. Following the failure of the Western Australian petition in London, the Australian Government

made a new effort to conciliate opinion in that isolated State. The Federal Cabinet in June traveled 2000 miles from Canberra to Perth, the capital of Western Australia, to hold a meeting and took advantage of the opportunity to discuss the economic grievances to which the State was subjected by Federal tariff and other policies. Dr. Earle Page, the Acting Prime Minister, proposed that joint State and Federal councils be established to handle economic issues in the same manner that the Australian Loan Council dealt with financial questions. Premier Collier of Western Australia made it plain that his State had no desire to withdraw from the federation, provided it received fair treatment at the hands of the more populous States.

State elections held in Victoria on March 2 and in New South Wales and Queensland on May 11 retained the existing governments in power. In Victoria the Labor Party won back only one of the 17 seats in the Legislature lost in the 1932 elections. A rift in the United Australia-Country party coalition, however, led to the resignation of the ministry under Sir Stanley Argyle (United Australia party) and the formation on April 2 of a Country-Labor coalition under the Country party leader, A. A. Dunstan. In Queensland, where the Labor party under the conservative leadership of Premier Forgan Smith had suffered only one defeat in 20 years, Labor increased its representation in the Legislative Assembly from 33 to 45. In New South Wales former Premier J. T. Lang, leader of the radical wing of the Australian Labor party, made an unsuccessful effort to oust the United Australia-Country party coalition which overthrew him in 1932. The new standing of the parties was: United Australia Party, 37; United Country Party, 23; Lang Labor Party, 30. One immediate result of the New South Wales election was to strengthen the position of the Lyons Government in the Federal sphere.

Relations with Britain. The outcry raised in the Lancashire textile district of England in 1934 against increases in the Australian tariff on British cotton goods was reciprocated in Australia in 1935 when the British restricted meat imports in the interests of domestic livestock growers. Under the Ottawa Agreements of 1932, and the Anglo-Argentine commercial treaty of 1933, exports of Dominion frozen beef to the United Kingdom had nearly doubled while Argentine exports of chilled and frozen beef to Britain had declined sharply. During this period Australia and New Zealand, through progress in research, developed a successful chilled beef industry also, but its expansion was blocked by the Anglo-Argentine Agreement. The Dominions accordingly agitated for the abrogation of the latter treaty, which they declared a violation in principle of the Ottawa Agreements of 1932.

Meanwhile the British livestock industry had been forced to the wall by cheaper Dominion meat, forcing the London Government in 1934 to advance cattle growers a subsidy of £3,000,000. In order that the value of the subsidy might not be lost through excess imports, Britain sought to induce the Dominions to limit their meat shipments. The Australians refused to consider such action until the British Government early in 1935 announced plans for levying a tariff on imported meat, the proceeds of which would go to subsidize the home producers. Faced with the loss of a vitally important market, the Lyons Government on Jan. 11, 1935, restricted beef exports to Britain for a three-months' period. Restrictions on exports of mutton and lamb were announced in March and shortly

afterwards a new tariff schedule, providing for important reductions on British goods, was introduced in the Australian Parliament.

Extended negotiations followed in London, in which Prime Minister Lyons and the other Dominion Premiers present for the King's Jubilee participated. In return for the temporary retention of the British preferential quota and an apparent promise that their chilled meat would receive preference over the Argentine product at the expiration of the Anglo-Argentine Agreement on Oct. 31, 1936, Australia and New Zealand agreed to keep their exports of mutton and lamb within fixed limits to the end of 1936, the quantities varying in proportion to the United Kingdom demand. The Dominions also agreed to specified restrictions on exports of pork, veal, and beef to the end of 1935. The British agreed to postpone the tariff on imported meat until Oct. 31, 1936. This agreement was favorably received in Australia and New Zealand.

Foreign Relations. Realizing that Australia could not hope to dispose of its entire exportable surplus in Great Britain, the government vigorously strove during 1935 to find new outlets in Italy, France, Germany, Belgium, Czechoslovakia, Japan, and the United States. Prime Minister Lyons discussed the trade problem with Washington authorities en route home from London. A trade mission was sent to India. A Japanese good-will mission, headed by Katsujō Debuchi, received a cordial welcome when it arrived in Australia in September to return the visit of an Australian trade mission to Japan the previous year.

While anxious to develop trade with Japan, Australia continued to view the Japanese expansion with suspicion. At a dinner given Mr. Debuchi, Sir Frank Clarke, president of the Victoria Legislature, bluntly warned Japan against expanding southward in Australia's direction. Fear of Japan, together with disturbed conditions elsewhere in the world, led to a substantial increase in Australian arms expenditures during the year. Defense preparations included the motorization of military forces, further coast defense rearmament, establishment of a local anti-aircraft gun factory, and the increase of the air force to 200 machines. A public works project for standardizing the gauge of the main railway systems to facilitate mobilization also was considered.

The development of the Anglo-Italian crisis over Ethiopia commencing in September produced a bitter internal debate in Australia on the issue of supporting the mother country. The Lyons Government in September decided to back Britain to the limit and the Australian delegate to the League of Nations actively supported the application of sanctions against Italy. Australian warships also joined the British fleet in the Mediterranean. The Lang Labor Party, however, won unexpected support for a resolution opposing Australia's involvement "in a second World War developing out of a conflict of imperial trading interests, notwithstanding any decision recorded by the League of Nations." The resolution was defeated in the Federal House of Representatives by a vote of 27 to 21. When William M. Hughes, vice president of the Executive Council who was Prime Minister of Australia during the World War, dissented from the government's policy on sanctions Mr. Lyons on November 6 forced his resignation from the cabinet. See GREAT BRITAIN under *History*.

AUSTRIA. A federal state of central Europe comprising the nine provinces of the City of Vien-

na, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna (Wien).

Area and Population. Austria has an area of 32,369 square miles; the population at the census of Mar. 22, 1934, totaled 6,759,062 (6,534,481 at the 1923 census). The 1934 census showed 3,248,000 males and 3,512,000 females. Living births in 1934 numbered 91,294; deaths, 85,387; marriages, 44,122. Emigrants in 1933 numbered 1404 (2129 in 1932). Provisional 1934 census returns for the chief cities were: Vienna, 1,874,581 (850,019 males and 1,024,562 females); Graz, 152,627; Linz, 108,854; Innsbruck, 61,003; Salzburg, 40,364; Wiener Neustadt, 36,812; St. Pölten, 36,283. At the 1934 census, there were 6,131,463 Roman Catholics, 236,262 Protestants and other Christians, 209,065 Jews, and 170,036 others.

Education. Primary education is compulsory. In 1934 there were 886,500 pupils in 5335 public and private elementary schools; 66,020 pupils in 169 secondary schools; and 16,281 students in the three state universities (Vienna, Graz, and Innsbruck). There were also various commercial, theological, and vocational schools.

Production. Agriculture, manufacturing, mining, and lumbering are the principal occupations. Production of the chief crops in 1934, with 1933 figures in parentheses, was (in metric tons) wheat, 360,300 (397,800); rye, 607,000 (687,000); barley, 298,100 (332,900); oats, 500,500 (502,800); corn, 149,800 (136,600); potatoes, 2,795,400 (2,354,900); sugar beets, 1,341,400 (1,067,500); raw flax fibre, 2200 (2800); linseed, 500 (440). The wine yield in 1934-35 was 789,000 hectoliters (hectoliter equals 26.4 U. S. gallons). The forests, covering 37 per cent of the total area, are an important source of income. Mineral and metallurgical production in 1934, with 1933 figures in parentheses, was (in 1000 metric tons): Coal, 251 (239), lignite, 2855 (3014), iron ore, 464 (266); pig iron, 134 (88); steel ingots and castings, 313 (226). The industrial census of 1930 showed 367,652 industrial establishments, with 1,438,967 employees. The clothing industry was the most important but a wide variety of articles were manufactured.

Foreign Trade. Imports in 1934 were valued at 1,154,191,000 schillings (1,148,121,000 in 1933) and exports at 863,024,000 (774,730,000 in 1933). Of the 1934 imports Germany supplied 17.1 per cent; Czechoslovakia, 13.7; Hungary, 11.2; Yugoslavia, 8.5; and United States, 5.3 per cent. Of the exports Germany purchased 15.8 per cent; Hungary, 11.6; Czechoslovakia, 7.4; Yugoslavia, 6.2, and the United States, 1.5 per cent. Coal, coke and briquets, swine, chemicals and drugs, corn, and raw cotton were leading imports, while the chief exports were iron and steel, wood, paper and cardboard, nonferrous metals, and electric machinery.

The favorable balance on foreign tourist traffic in 1935 was estimated at 150,000,000 schillings and receipts from exported electric power at 18,000,000 schillings, thus offsetting the adverse trade balance for the year.

Finance. The 1935 budget estimates placed ordinary receipts and expenditures at 1,846,700,000 schillings and 1,899,900,000 schillings, respectively. Extraordinary expenditures, to be raised through new loans, were fixed at 100,000,000 schillings. Budget deficits had been continuous since 1930. Final returns for 1934 showed revenues of 1,348,000,000 schillings, ordinary expenditures of 1,464,000,000 schillings, and extraordinary expenditures of 110,000,000 schillings. National defense expenditures,

which rose to 254,000,000 schillings from the estimates of 191,000,000 schillings, were chiefly responsible for the unexpectedly large deficit.

The national debt on Dec. 31, 1934, totaled 3,526,500,000 schillings (3,287,800,000 on Dec. 31, 1933). The 1934 debt was divided as follows: Internal, 1,113,500,000 schillings; external, 2,413,000,000 schillings. The schilling (par value, \$0.2382) exchanged at an average of \$0.1542 in 1933 and \$0.1879 in 1934.

Communications. Of the 4174 miles of railway line open in 1933, 3611 miles were owned or operated by the state. In the same year the state lines carried 59,997,000 passengers and 18,510,294 metric tons of freight. The motor services of the Federal Railways in 1934 carried 5,000,000 passengers and 65,000 metric tons of freight. Highways extended about 8650 miles. State-subsidized air lines operate within Austria. Vienna was an important junction of the European air network.

Government. The Constitution of May 1, 1934, declared Austria "A Christian, Federal State on a corporative basis." Repudiating the liberal, democratic provisions of the previous republican constitution, it provided for an "authoritarian" or Fascist régime, in which the Roman Catholic Church occupied a privileged position. Extensive powers were placed in the hands of the President, to be elected for seven years by the burgomasters (mayors) of Austria from three candidates selected by the Federal Assembly. He was empowered to appoint and dismiss the Chancellor at his discretion. The press, the theatre, and the radio were placed under strict government control. In place of a representative assembly, provision was made for four appointive advisory councils, as follows: (1) A Council of State of 40 to 50 "worthy citizens," (2) a Federal Cultural Council of 30 to 40 representatives of legally recognized churches, educational bodies, sciences and arts, (3) a Federal Economic Council of 70 to 80 representatives of agriculture, industry, commerce, and finance, and (4) a Provincial Council, including the Governor and a financial representative from each province. The Federal Diet, which was to pass on legislation submitted to it by the government, consisted of 20 members of the Council of State, 10 members of the Cultural Council, 20 members of the Economic Council, and 9 members of the Provincial Council. Another body, called the Federal Assembly, was to consist of all the members of the four Councils. Its function was to nominate three candidates for President, to authorize a declaration of war, etc.

President in 1935, Dr. Wilhelm Miklas, who assumed the office in 1928 Federal Chancellor and Minister of Defense, Education, and Justice, Dr. Kurt Schuschnigg. Other members of the cabinet at the beginning of the year were: Vice Chancellor and Minister of Security, Prince Ernst Rudiger von Starhemberg; Finance, Dr. Karl Buresch; Commerce and Communications, Fritz Stockinger; Social Administration, E. Neustadter Sturmer; Interior, Emil Fey; Agriculture and Forestry, Josef Reither; Foreign Affairs, Egon Berger-Waldenegg.

HISTORY

Internal Affairs. The Fascist-Clerical dictatorship established by Chancellor Dollfuss to check Adolf Hitler's forceful drive for Austro-German union had gained a new lease on life by the bloody repression of the Austrian Socialist and Nazi movements in 1934 (see 1934 YEAR BOOK, pp. 65-

67). In 1935 it steered a precarious and wavering course amid growing dangers at home and abroad. The illegal Nazi and Socialist organizations, undoubtedly controlling between them a strong majority of the population, continued their bitter underground struggle against the government. Dissensions within the Cabinet became increasingly violent, the antagonisms arising from domestic issues being fanned to greater intensity by serious divisions on foreign policy.

The Nazi movement within Austria, despite sporadic propaganda campaigns, remained relatively quiescent throughout 1935. Following the German victory in the Saar plebiscite of January 13, the Austrian government took extreme precautions to check a threatened uprising, but the Nazis contented themselves with a few peaceful demonstrations. In some quarters the apparent weakening of the Nazis was attributed to the incompetence and corruption of their leaders, and a drift from Nazi to Socialist ranks was reported. Other authorities held that for reasons of internal and external policy Hitler had called a temporary halt to the activities of his Austrian adherents. Another explanation advanced was the fear of the government instilled by heavy sentences imposed on Nazis convicted of complicity in the abortive *putsch* of July, 1934, in which Chancellor Dollfuss was killed. Of 752 Nazis tried up to December, 1934, 31 were sentenced to death, 42 to life imprisonment, and the remainder to prison terms aggregating 1967 years. The trials continued with similar results during the first part of 1935. Seventeen defendants were sentenced to death by a Salzburg court early in March for smuggling explosives from Germany shortly before the *putsch*. Later the same month Dr. Anton Rintelen, former Austrian Chancellor; Major Selinger; and Police Commissar Gotzmann, former commander of the Storm Troops in Vienna, received life sentences. Rintelen, then Ambassador to Rome, had been named by Nazi conspirators, who seized the Vienna broadcasting station during the *putsch*, as the successor to Chancellor Dollfuss.

In contrast with Nazi quiescence, the Social Democrats and other radical and liberal groups appeared to be rapidly reorganizing their forces, which had been shattered by the savage civil war of February, 1934. Government efforts to repress the Socialist resurgence were only partly successful. The police, aided by Prince von Starhemberg's reactionary Heimwehr troops, arrested some 200 Socialists during the first anniversary of the February, 1934, struggle. In April, 21 officers of the Republican Defense Corps (Socialist Schutzbund) were convicted of treason and sentenced to varying terms in prison.

Spurred, perhaps, by these developments, the Social Democrats in July reached an agreement with their former enemies, the Communists, for the establishment of a united front against the Fascist government. Shortly afterwards the radical leaders were able to realize in part their programme for merging in their united front other discontented elements, such as liberals, deserters from the Nazi ranks, and even Catholic trade unionists. Meanwhile the illegal Social Democratic trade unions were resuming their once dominant position in Austrian industry and radical workers were resorting increasingly to strikes and passive resistance in the face of harsh penalties.

Government Dissensions. The reorganization of the forces attached to the principles of the former democratic republic was favored by the schisms within the government, which was split into four

main groups. The Clericals, headed by Chancellor Schuschnigg and supported by a private army called the *Sturmscharen* (Storm Troops), worked in close collaboration with Cardinal Innitzer and the Vatican. Their strongest rivals were Prince Ernst Rudiger von Starhemberg and his Fascist private army, the Heimwehr. The Prince espoused fascism on the Italian model and was a close friend and admirer of Mussolini, from whom he was said to have received funds and armaments for his Heimwehr army. A third group consisted of Catholic workers, led by Herr Winter and Herr Kunschak and organized as the *Freiheitsbund*, who were separated from both Clericals and Fascists by their attachment to democratic principles. A fourth group which was opposed to democracy, clericalism, and fascism of the Italian model alike came to the fore during the year. Composed of members of the former Agrarian and Pan German parties, the so-called National Action or German National party was in close sympathy with Nazi aims, though never formally identified with the Nazi movement. Although lacking a private army, the German Nationalists had powerful support from certain members of the Cabinet, the governors of several of the Provinces, and from Col. Franz von Papen, the German Minister to Vienna.

The conflicts among these groups and their leaders were carried on within the Cabinet and the so-called Fatherland Front created on May 1, 1934, to replace all existing political parties. Prince Starhemberg's nominal leadership of all the private military groups within the Fatherland Front was extended to the regular army of 38,000 men on May 24, 1935, when the army was officially incorporated in the Fatherland Front. (Shortly before the powers had consented to an increase in the Austrian army by 8000 men above the 30,000 limit fixed in the Treaty of St. Germain.) Throughout 1935, however, there were reports of clashes between Starhemberg's Heimwehr and the Catholic Storm Troops, accompanied by evidences of a vigorous struggle between Starhemberg and Schuschnigg for control of the government. On May 26, for instance, Prince Starhemberg announced that the private armies were to be reduced by the dismissal of all members who had joined subsequent to Feb. 1, 1934. The order was ignored by the Catholic Storm Troops and the Catholic workers' *Freiheitsbund*. Most of their members had been recruited after the date mentioned, while the Heimwehr had been organized long before that date. Consequently observance of the order would have left Starhemberg in virtually complete control of Austrian military organizations.

Anti-Hapsburg Laws Repealed. Fearing that Mussolini's absorption in the conquest of Ethiopia would open the way for another attempt by Hitler to win control of Austria, the government on July 10 secured the Federal Assembly's approval of a bill repealing the anti-Hapsburg laws passed in April, 1919. The law removed the restrictions placed upon the residence of members of the Hapsburg family in Austria and provided for the restoration of the confiscated Hapsburg family properties, with certain exceptions. The measure was apparently designed to strengthen the Cabinet's position by placating Monarchists and Catholics and to pave the way for the early restoration of the Hapsburgs in the person of Archduke Otto. This would automatically erect a barrier to Austro-German union.

The immediate result of this move was to

strengthen the position of Vice Chancellor Starhemberg, who had urged eventual restoration of the monarchy with himself as regent. About the same time the Prince announced plans for unification of the various private armies in a national militia, to be dominated by the Heimwehr.

Reorganization of Cabinet. A counter-move by the German Nationalists against Prince von Starhemberg followed soon after. Their spokesman, Governor Rehrl of Salzburg, was reported to have conferred with Chancellor Schuschnigg on August 2 and urged an alliance against Starhemberg and his Italianophile policy. The pro-Germans demanded the right to carry on open propaganda for Austro-German union and to establish their own private army. They wanted the government reorganized on a pro-German basis and all of its anti-German political and economic measures withdrawn. Starhemberg and all his partisans in the cabinet were to be eliminated and a new cabinet formed with Governor Gleissner of Upper Austria as Chancellor. The German Minister, von Papen, strongly supported these proposals. He promised that if they were accepted, the Austrian Nazis would end their efforts to overturn the government by revolution and that the Reich government would grant Austria important economic concessions, including large orders for armaments.

Only the main outlines of the subsequent realignment of forces within the government were clear at the end of the year. At first it appeared as though the pro-German policy was to prevail. The government checked press criticisms of German leaders and institutions, arranged for the resumption of mutual Austro-German radio broadcasts, released a number of Nazi political prisoners, and promised early freedom to Anton von Rintelen. Believing that the wind was blowing against Starhemberg, Maj. Emil Fey, commander of the Heimwehr units in Vienna, entered into negotiations with the German Nationalists and was said to have been promised the War portfolio in their prospective cabinet. At the same time Fey's enemies in the Schuschnigg Cabinet began an investigation into charges that he was implicated in the Nazi *putsch* of 1934.

Prince Starhemberg, however, succeeded in turning the tables on his enemies. In October he reached a settlement with Chancellor Schuschnigg of various issues, particularly those involving Catholic youth organizations, which had long divided the Fascists and Clericals. The two groups then united against the pro-Germans and other opponents in the government. Concentrating detachments of Lower Austrian Heimwehr in Vienna to prevent a coup d'état by Major Fey, the Schuschnigg-Starhemberg factions called a Cabinet meeting on October 17 at which the Chancellor tendered his resignation. President Miklas immediately commissioned him to form a new one and he resumed office with a reorganized Clerical-Heimwehr Cabinet from which Major Fey and his friends were eliminated. Besides Prince Starhemberg as Vice Chancellor, the new ministry included Dr. Egon Berger-Waldenegg (Heimwehr), Foreign Affairs; Maj. Bahr von Bahrenfels (Heimwehr), Interior and Security; Dr. Ludwig Draxler (Heimwehr), Finance; Dr. Robert Winterstein (Catholic), Justice; Dr. Dobretsberger (Catholic), Social Welfare; Fritz Stockinger (Heimwehr), Trade and Transport; Ludwig Strobl, Agriculture; and Dr. Karl Buresch (Catholic), Minister without Portfolio.

The cabinet reorganization left Prince Starhem-

berg virtual dictator of Austria, subject however to the still-powerful influence of the Clericals. He proceeded immediately to unify the various private armies in a national militia under his command, although the Catholic Storm Troops were permitted to retain their former uniforms. At the same time Austria adopted even more openly a pro-Italian policy with respect to League sanctions. The Heimwehr leader in some quarters was charged with scheming to establish himself as Regent and then as King of Austria. In an important speech to the Heimwehr on December 11 he announced that the question of restoration of the monarchy would be subordinated to the creation of "a 100 per cent Fascist state." Throwing down the gauntlet to Hitler and the pro-Germans in Austria, he declared that the question of Pan-Germanism could only be solved under Austrian leadership.

The end of the year thus found little if any improvement in the basically weak position of the Schuschnigg Government. By the cabinet reorganization of October 17 it had made bitter enemies of the German Nationalists, a strong bloc of the Vienna Heimwehr which remained loyal to Major Fey, and the Catholic workers whose leaders had also been ousted from government posts and whose military defense group, the *Freiheitsbund*, was being destroyed. At the same time, the government's efforts to gain the support of the Social Democrats through the unqualified Christmas amnesty extended 154 Socialist political prisoners on December 23 seemed unlikely to succeed. Nazi prisoners shared to a lesser extent in the amnesty proclamation.

Foreign Affairs. With the great powers playing feverishly for high stakes, Austria remained throughout 1935 a key pawn on the European diplomatic chessboard. The rapprochement between France and Italy produced by Hitler's efforts to absorb Austria in 1934 bore fruit in the Franco-Italian agreement of Jan 7, 1935 (see FRANCE and ITALY under *History*). One feature of the agreement was a proposal for a Danubian pact to safeguard Austria's independence against Germany. This proposal received British backing in the Franco-British communiqué of February 3, and at the Stresa Conference, where France, Britain, and Italy reiterated their support of Austria's independence, the Danubian conference was tentatively set for May 20 in Rome.

In preparation for the conference the Foreign Ministers of Italy, Austria, and Hungary, which had established a politico-economic bloc in 1934, met at Venice on May 4-6. Further conversations between Mussolini and Chancellor Schuschnigg were held in Florence on May 11. The Danubian conference was not held during 1935, due chiefly to the break in the Stresa front resulting from Britain's opposition to Italian policy in Ethiopia (q.v.). However the preliminary conversations at Venice and Florence resulted in an agreement by which the Little Entente agreed to an increase of 8000 men in the Austrian army. Austria agreed in return not to insist upon territorial revision or restoration of the Hapsburgs. The subsequent repeal of the Hapsburg Exclusion Law on July 10 produced a furore in the Little Entente states, although the Vienna Government emphatically declared that it did not signify immediate restoration of the monarchy or even the return of Archduke Otto to Austria. The Little Entente again gave warning, however, that their armies would mobilize immediately if any attempt were made to restore the Hapsburgs.

At Geneva on October 11 Austria was recorded

as voting with Hungary and Albania in opposition to the application of economic sanctions against Italy. Early in November when a delegation of Austrian officials visited London to seek an extension of a large credit advanced by British bankers to the government-controlled Credit Anstalt in Vienna they were met with a curt refusal. Several days later (November 12) the Austrian Foreign Minister announced that Austria's position on sanctions had been misunderstood as a negative vote when in fact Austria stood strictly behind the League. About the same time it was learned that the two munitions factories in Austria had been ordered to cease deliveries to Italy. The Austrian Government explained that it was forbidden to export arms under the Treaty of St. Germain. It was well known, however, that secret armament shipments between Austria, Hungary, and Italy had gone on previously with the government's tacit consent, if not active participation.

These developments appeared inconsistent with Prince Starhemberg's recent triumph over the Pro-Germans and other anti-Italian elements. But as the year ended the government-controlled press in Austria gave strong indication that a new turn in Austrian foreign policy was taking place. It was believed that the Vienna authorities, sceptical of Italy's ability to preserve Austrian independence and yet fearful of Germany, was gradually moving under the inspiration of Britain, France, and the Vatican to alignment with the Little Entente. Late in December the International Committee of Creditors of the Credit Anstalt, in which British interests dominated, accepted the Austrian Government's offer to pay about 43 per cent of the outstanding "live claims" of about 180,000,000 schillings. The Christmas amnesty to Socialist political prisoners, vigorous criticism in the Austrian press of Italian policies in the Tirol, and a scheduled visit of Chancellor Schuschnigg to Prague in mid-January, coinciding with the drastic reduction of British claims, were considered significant steps away from Austria's close political understanding with Italy. See CZECHOSLOVAKIA, GERMANY, GREAT BRITAIN, and HUNGARY under *History*; LITTLE ENTENTE.

AUTHORS' LEAGUE OF AMERICA. A national organization of authors, dramatists, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The league includes the dramatists' guild, the authors' guild, and the screen writers' guild. Closely affiliated with it is the Authors' League Fund, an agency formed by the league to meet its obligations with respect to the care of the sick, the aged, and the unfortunate. The officers in 1935-36 were: President, Marc Connelly; vice-president, Elmer Davis; secretary and treasurer, Luise Silcox. Headquarters are at 9 East Thirty-eighth Street, New York City.

AUTOGIROS. See *AERONAUTICS*.

AUTOMOBILE RACING. The attaining of his goal, that of whizzing along in an automobile at the rate of five miles a minute, by Sir Malcolm Campbell, British sportsman, was the outstanding achievement of 1935 in the motor racing field. Twice within a seven-months span, the Briton piloted his *Bluebird* over a measured mile at bet-

ter time than the world's mark at the start of the year. The 50-year-old driver raced over the sands at Daytona Beach, Fla., in March at 276,816 miles an hour, bettering his previous mark of 272,108. He sailed to England and returned later in the year and on the Bonneville Salt Flats in Utah in September negotiated a measured mile in 11.995 sec. (301.1292 m.p.h.).

Kelly Petillo won the 1935 national championship by virtue of his fine triumph in the annual 500-mile race at Indianapolis on Memorial Day. For that victory, achieved at an average speed of 106.240 miles an hour, the fastest winning time for the event, Petillo gained 600 points towards the championship. He won 290 more points during the year to finish first, ahead of Bill Cummings, 1934 winner of the Indianapolis race and who finished third in 1935, and Wilbur Shaw, runner-up to Petillo at Indianapolis. George MacKenzie won the Eastern States title and Babe Stapp the Midwestern States honors.

AUTOMOBILES. More and more, as automobiles could be improved less and less mechanically, it has been the practice to resort to eye appeal and rely on changing style to stimulate new car buying. Gradually the introduction of new models became an annual event for all makers and coincidental for most—the chosen time for the new announcements was the annual national automobile show in New York in January. As a result the business became decidedly seasonal and with a correspondingly fluctuating employment factor. The winter was the slackest period and the worst time for those out of work to find other employment. With the aim of relieving labor of that hardship and of more nearly stabilizing employment throughout the year, the manufacturers agreed during 1935 to advance the announcements of new models and hold the automobile show, in New York City, during the first week in November, 1935. Local shows throughout the country were likewise advanced with the result that more new cars were sold in November and December than in the corresponding months of any previous year, consequently the year's production was larger than it would have been without this artificial stimulant. This fact must be borne in mind in judging the industry's current recovery from the depression, for the production of 4,182,491 motor vehicles in 1935 was a 46 per cent increase over 1934.

That there were two changes of models during 1935 whereas there will be only the usual one next year, must also be remembered when 1936 figures are analyzed. Many think, however, that the usually heavier spring buying will still be experienced because the replacement market is still far from satisfied, as indicated by the large number of old cars yet in operation.

Since reliability and performance have been more nearly uniform the car makers have vied with each other to set the style. When one was outstandingly successful the succeeding year's offerings showed its influence. This was strikingly evident this year. The Oldsmobile was the fortunate one and the 1936 cars very generally adopted similar lines, particularly in front-end treatment, the narrow high oval grille being found on most of the new cars. Only two cars—the Cord and the Lincoln-Zephyr—were radically original and both were newcomers although products of old manufacturers. The Cord was a revival of an old member of the Auburn line, that had latterly been discontinued. It had a front-drive as before but in an entirely new guise. The

hood has neither lateral taper nor front vertical slope. The two sides were parallel and blended into the vertical rounded front and all around were horizontal louvres resembling blind shutters. The body and fenders were more in the current mode but the roof was only 60 inches from the ground and running boards were entirely absent.

The Lincoln-Zephyr had little external resemblance to the Cord but had two features in common with it—the hood was fixed and the top of it, in one piece hinged at the back, could be lifted to give access to the power plant; the body and frame were consolidated—a practice introduced by Chrysler in the airflow line during the previous year. There was no separate chassis as such and the body-frame members contributed to the structural strength and rigidity of the ensemble to which power plant, drive, wheels, and their suspension were then affixed, instead of first assembling them on a frame to which the body was added.

While there was comparatively little that was new in the new cars as a whole they were considerably improved in appearance, somewhat in convenience and reliability of operation, and decidedly so in comfort. From past experience that diminishing major changes and relative standardization in all but decorative treatment presages a marked departure in practice, many predicted the approach of a revolution in general design. The Cord and Zephyr may be harbingers of such a change and possibly have set examples that will be followed by others, unless the industry goes still more radical and inclines toward the lines of Stout's Scarab announced early in 1935 and refined in exterior lines late in the year. Reversing present practice the engine is at the rear and the luggage and spare tire compartment at the front. The body and fenders are blended into a beetle-like shell from which the car derives its name. This car had no separate chassis frame and was constructed more like an aeroplane fuselage. The passengers were all seated between the axles on seats that can be disposed at will.

All cars now provide baggage space behind the rear seat. Some make it accessible from within the car by hinging the back cushion, but more have a door on the back and opening all the way down, instead of top lids only, as formerly found on the built-in trunks. These spaces generally receive the spare tire also so that external mounting at the rear or in fender wells is unnecessary except where unusual luggage space is required.

The complete all-steel body, i. e. roof included, is now almost universal. Its advent was a blow to radio installations as it did away with the roof antennae, in lieu of which a less efficient mounting under the running boards had to be accepted. Reo, Dodge, Chrysler, and De Soto, however, have insulated the roof section from the rest of the body so that it may be used as the radio aerial.

Nearly all power plants received some refinements but there were no outstanding changes in engines or clutches. Transmissions came in for the most attention. Helical gears were the rule, not only for high and second speeds, but for low and reverse as well. Silent shifting was introduced in nearly all power plants. Overdrives, introduced by Chrysler and Auburn a year ago, were offered by several other makers.

Independent front wheel suspension was continued on the lines that had it previously. Hudson and Terraplane discontinued the option of the axleflex substituting, as standard equipment, an axle trunnioned in the saddles of leaf springs shackled at both ends, and positioned by two radius arms which

take the thrust, including that of steering and braking. The springs being relieved of all but load carrying functions can be softer and more resilient.

Trucks had their best year since 1929 being only 10 per cent under that peak in production and 30 per cent under in dollar volume. The latest models showed the passenger car influence of more attention to style and comfort, and streamlining has added to their appearance, if not to their performance. Safety has had much attention, brakes particularly, so that trucks stop as quickly or quicker than any lighter vehicle. In the past eight years truck accidents have increased only 10 per cent, while passenger car accidents have increased 60 per cent. Bus accidents have declined. Diesel engine powering is being studied by the truck makers and 600 units were put out with such engines in 1935.

Statistics. Preliminary facts and figures released by the Automobile Manufacturers Association placed the total production of passenger cars in the United States and Canada at 3,425,578 and trucks at 756,913. Of the passenger cars 99 per cent were closed models. The wholesale value of cars was \$1,810,000,000 and of trucks \$392,000,000, or a total vehicle value of \$2,202,000,000. Car buyers not only spent 58 per cent more for cars than in the previous year but many bought better cars because the average factory price was \$705 as against \$663 in 1934. The average factory price of trucks showed little change, \$691 instead of \$696. Tire shipments were estimated at 50,000,000 casings. Those sold for replacement on cars in use represented a wholesale value of \$248,000,000—about \$3,000,000 more than the year before. This and a \$530,000,000 increase in retail value of gasoline consumed pointed to a greater use of vehicles, although the gasoline figure was augmented by the increase in number of cars registered. In 1935 the total figure for retail value (including taxes) of gasoline sold was \$3,260,000,000. The wholesale value of parts and accessories for replacement and service equipment was \$565,000,000, so the industry's total business for the year was \$3,015,000,000—a 36 per cent gain over 1934.

Motor vehicles registered were approximately 26,000,000 divided as 22,450,000 cars and 3,550,000 trucks. This was the second year of advance from the previous decline and showed over 1934 a 4¼ per cent gain for cars and a 4 per cent gain for trucks. World registration of motor vehicles was probably 36,500,000; therefore the United States could claim 71 per cent of them. Farmers owned about 18½ per cent of America's passenger cars (4,134,675) and about 25 per cent of the trucks (900,385). Further analysis of the operation of the total trucks in use in the United States showed 780,000 operated in fleets and 28,035 fleets of more than five trucks each. While trucks constituted only 13½ per cent of all motor vehicles they paid 24 per cent of all motor taxes. The sum of truck taxes in 1935 was \$314,000,000. Operation of trucks gave employment to 2½ million drivers and 48,000 communities depended exclusively upon trucks for their service.

Motor buses added nearly 4 per cent to their number, reaching 116,500. Of these 45,000 were in revenue service, 18,380 in local or transit service, 70,500 were used by 23,650 consolidated schools, 12,600 by 190 street railways, and 65 by steam railroads. Buses in city service were operated by 825 companies including street railways.

Again the taxes paid by motor users went up 1 per cent in relation to total taxes collected by Federal, State, and local governments, being 13

where they were 12 per cent in 1934 and 11 per cent in 1933. While there was some increase of gasoline tax rates (see below under *Legislation*) the foregoing comparison is in revenues and means mainly that motor revenues increased more than others. Their total for 1935 was \$1,288,000,000, or 6 per cent over 1934, and included \$804,500,000 of Federal, State, and municipal gasoline taxes. Increase of the latter from the 1934 assessment of \$745,100,000 was nearly 8 per cent, but the gasoline consumption increased nearly 12 per cent, indicating that cars are more freely used in States having lower gas taxes.

The automotive industry is the best customer of many of its supplying industries. Of gasoline it takes 89 per cent of the total consumption, of plate glass 77 per cent, rubber 75 per cent, lubricants 59 per cent, lead 39 per cent, nickel 33 per cent, steel and iron 23 per cent, copper 22 per cent, tin 20 per cent, aluminum 16 per cent, zinc 15 per cent, and lumber and hardwood 8 per cent. Gasoline used by motor vehicles during the year amounted to 16,150,000,000 gallons and lubricants 485,000,000 gallons. The crude rubber that went into vehicles totaled 885,000,000 pounds and cotton for tires 210,000,000 pounds. Of the total freight handled by the railroads, 3,422,000 carloads were automotive.

The retail motor vehicle business considerably improved for at the end of the year there were 39,400 car and truck dealers, nearly 7 per cent more than a year before. Garages, service stations, and repair shops remained about the same—98,169. Total retail outlets, duplications eliminated, were 105,330, a slight decline from the 105,944 in 1934. Wholesalers increased from 5465 to 5932 and retail gasoline outlets from 317,000 to 320,000.

Foreign sales had increased continuously since 1933. In that year they were 29 per cent above 1932. In 1934 they bettered the preceding year by 75 per cent, and in 1935 the gain was 32 per cent. The exports of United States factories combined with the output of their Canadian plants numbered 565,000 motor vehicles. This amounted to 13.6 per cent of the total production.

Legislation. Forty-four State legislatures held regular sessions in 1935 and 15 had special sessions. About 7000 bills were introduced affecting motor vehicle manufacturers, dealers, and users, of which over 1200 were enacted into law. Most of the measures that drew serious opposition from the highway users were defeated; some that were not too popular did pass, but the greater part of the new laws were acceptable at least and many decidedly gratifying. The last may be said especially of those that were aimed toward greater safety.

Specifically in this class were the adoption of financial responsibility laws by five more States—Arizona, Colorado, Ohio, Oregon, and West Virginia—bringing the number of States having such laws up to 26. The District of Columbia was also added to the list by Congress. Colorado, Montana, North Dakota, and Oklahoma established highway patrols, leaving Georgia now the only State without such protection. Seven other States increased their patrol forces. Safety glass was made a requirement for vehicles operated in 15 more States; the total number of such States was 23. In this respect the manufacturers had been rather ahead of the laws, most of them providing safety glass as standard equipment throughout (not simply in windshields where it had been standard for some years) instead of an option at extra cost. Compulsory periodic motor vehicle inspection was

spreading. Five States in 1935 (Colorado, Connecticut, Iowa, Utah, and Vermont) put it on their statute books and many others had it in prospect. Drivers' license laws became more universal. Idaho, Montana, North Carolina, and North Dakota joined the list in 1935 bringing the total number of States having them to 33 and the District of Columbia.

On the adverse side of the legislative picture the principal element was the still upward trend of taxes, however at a declining rate of increase. Bills to increase gasoline taxes were introduced in 32 legislatures in 1935, but were passed in only five States. Connecticut, Delaware, Nebraska, New York, and Pennsylvania each added one cent, but in only two of these were they permanent. The last three States named passed them as emergency measures automatically terminating in one to three years. These were ear-marked for diversion. Most of the proposals for diverting motor vehicle revenue to other than highway purposes were defeated. Colorado reduced its tax rate from 5 to 4 cents a gallon.

Registration fees on the other hand showed a downward trend. Eight states—Connecticut, Minnesota, North Carolina, Ohio, Tennessee, Utah, Vermont, and West Virginia—either reduced fees directly or changed the determining base in a way that effected a reduction on passenger cars. Trucks likewise escaped nearly all of the efforts to increase their fees.

Nor did trucks suffer in any of the revisions of size and weight restrictions made in a few States, for, of the downward revisions, only one went below the dimensional standards of the Uniform Code recommended by the American Association of State Highway Officials and most were even more liberal.

Port of Entry laws are something new to harass interstate commerce. Kansas initiated the type in 1934. It subjected common carriers entering the State to inspection as to equipment, cargo, and overloading; declaration of point of departure, destination, and route to be covered through the State, and exacted a mileage fee therefor before issuing clearance papers. Delaware, Nebraska, New Mexico, Oklahoma, and Maine enacted similar laws in 1935 but few were as drastic. Delaware will not enforce it unless neighboring States adopt such laws, so it seems to be a measure of preparedness. Nebraska's law affects only vehicles carrying petroleum products; Maine's also provides for checking up intrastate trucks to impose the higher fees required if they are overloaded.

Connecticut, Rhode Island, and Delaware joined the States regulating the rates and services of common and contract carriers leaving now only two States that do not. Delaware included private carriers and Colorado, Nevada, North Dakota, and Wyoming amended their motor carrier laws to include some regulation of private operators hauling their own merchandise between cities.

The Federal Government, for the first time, passed a law regulating rates and services of interstate common and contract carriers. Administration is in the hands of a new Motor Carriers Bureau of the Interstate Commerce Commission which has the power also to prescribe regulations of the qualifications and hours of service of drivers, equipment standards, and safe operation of shippers' trucks engaged in interstate commerce, if it finds such regulation necessary. In that event the Act includes the right of the Commission to inspect property, records, accounts, and correspondence.

One other act of Congress was of direct concern to the automotive field—continuation for another year of the excise taxes that were to have expired at the end of 1935. The desire of the Treasury Department to have these made a permanent part of the national taxation system was not granted.

In several States compulsory liability insurance bills were introduced but none were passed. Massachusetts still has the distinction of being the only State having such a law.

What are known as "caravanning" laws were enacted by several Western States. In general they require permits or registrations and the payment of fees for all vehicles driven or towed into or through the State intended to be sold at destination. Arkansas, California, Nebraska, New Mexico, and Texas passed such laws and Nevada a similar law for vehicles towed or carried and Wyoming one applying only to towed vehicles. See INSURANCE.

AVIATION. See AERONAUTICS.

AZERBAIJAN (a'zér-bi-jan') **SOVIET SOCIALIST REPUBLIC.** A republic of the Transcaucasian S.F.S.R. of the Soviet Union. It includes the Nakhichevan Soviet Socialist Republic and the Nagorni Karabakh Autonomous Region. Area, 32,686 sq miles, population (1933), 2,891,000. Baku, the capital, had 709,500 inhabitants; Gandzha, 74,331. During 1933 there were 428,000 students in the elementary and secondary schools, and 12,000 students in 17 institutions of higher education.

Production. The main industry was the production of petroleum (in 1934 the output totaled 19,019,956 tons). Fishing, textiles, copper, salt, and agriculture were important industries.

AZORES, a-zôr' An archipelago 800 miles west of Portugal of which it is a province. Area, 922 sq miles; population (1930), 253,935.

BADEN. See GERMANY.

BAHÁ'Í FAITH. A religion upholding the principle of the oneness of mankind and asserting that the world has entered a new cycle of evolution in which will be established a world order and universal peace. Its Herald was Mirza Ali Muhammad, known as the Báb (the Gate), whose announcement on May 23, 1844, revealed the dawn of the new day. The Báb was martyred in the city of Tabriz on July 9, 1850, by order of the government instigated by Mohammedan leaders. Its Author and Source was Bahá'u'lláh (Glory of God), who ascended in 1892 at 'Akká, Syria, after 50 years' imprisonment and exile. Bahá'u'lláh's eldest son 'Abdu'l-Bahá (Servant of Bahá), the appointed Interpreter and Exemplar of the Faith, promulgated its teachings in the Orient and Occident, traveling through Europe and America between 1911 and 1913. Since 1921, Shoghi Effendi, 'Abdu'l-Bahá's grandson, has been Guardian in accordance with 'Abdu'l-Bahá's testament.

The Bahá'í teachings include spiritual and social principles: the continuity of divine revelation; the identity of aim and spirit in all prophetic religions; the essential harmony of science and religion; abolition of the institution of professional clergy; the spiritual importance of useful daily work; equality of men and women; universal education; and universal peace, based upon the union of peoples and of governments for the attainment of the true purposes of human life.

The administrative order of the faith contains local, national, and international institutions and is regarded by Bahá'ís as the true pattern of world unity. The local community elects annually a spirit-

ual assembly of nine members who are responsible for local Bahá'í activities and welfare. The community also elects delegates to an annual meeting at which is elected a national spiritual assembly of nine members. The national assemblies will in future be electoral bodies for the formation of an international assembly, of which the Guardian will be the chairman. The twenty-seventh annual meeting of American Bahá'ís in 1935 noted the increase of local assemblies from sixty to seventy, and the largest increase in the number of individual believers recorded for any one year.

On August first was completed the external ornamentation of the clerestory section of the Bahá'í House of Worship at Wilmette, Ill., at a cost of \$45,000. During the year important accessions to the literature of the Faith were: *Gleanings from the Writings of Bahá'u'lláh*, *The Bahá'í World*, Vol. V, *The Promise of All Ages*, by Christophil, and *Security for a Failing World*, by Stanwood Cobb. *The Bahá'í Magazine* was combined with *World Unity* under the new title, *World Order*.

The Bahá'í literature of fundamental importance includes: *Gleanings from the Writings of Bahá'u'lláh*, *Tablet of Iqán* (Book of Certitude), *Hidden Words*, and *Tablets*, by Bahá'u'lláh; *Some Answered Questions*, *Promulgation of Universal Peace*, *Tablets*, and *Mysterious Forces of Civilization*, by 'Abdu'l-Bahá; *Bahá'í Administration* and *The World Order of Bahá'u'lláh*, by Shoghi Effendi. Official publications in the United States and Canada are: *World Order*, a monthly magazine, *Bahá'í News*, *The Bahá'í World* (a biennial international record). A national office is maintained at 130 Evergreen Place, West Englewood, N. J. The world centre is at Haifa, Palestine.

BAHAMAS, ba-há'maz. An archipelago of the British West Indies. Area, 4404 sq. miles, population (1934 estimate), 62,679 compared with 59,808 (1931 census). The main islands were New Providence (containing Nassau the capital); Eleuthera and Harbour Island; Andros; Long Island; Abaco, Cat Island, Extuma; Fortune Island Group; Grand Bahama; and Inagua.

Production and Trade. Sponges, shells, tomatoes, pine lumber, and sisal were the principal products. During 1934, exclusive of bullion and specie, imports were valued at £725,480; exports were valued at £148,615. The U. S. A. sent £264,954 of the imports; Great Britain, £182,531; Canada, £135,100. A total of 25,609 tourists landed at Nassau between Dec. 1, 1934, and Mar. 31, 1935.

Government. In 1934-35, revenue amounted to £277,544, expenditure, £276,961; public debt, £180,000. The colony is ruled by a governor who was aided by an executive council of 9, a legislative council of 9, and a representative assembly of 29 members. Governor and Commander-in-Chief, Sir B. F. H. Clifford.

History. During Sept. 27-28, 1935, a hurricane killed 16 people and ruined many houses on Grand Bahama and northeast Abaco; ruined food crops and houses on Little Cayman and Caymanbrac; and destroyed 60 per cent of the houses on Bimini.

BAHRAIN ISLANDS. See under ARABIA.

BAKER, GEORGE PIERCE. An American educator, died in New York City, January 6. He was born in Providence, R. I., Apr. 4, 1866 and was educated at Harvard University, graduating in 1887. He returned to the University in 1888 and became an instructor in English, teaching forensic from 1889 to 1892 and English from 1892 to 1895. In 1905 Baker became full professor of English, a

position he held until 1924. His twenty-year occupancy of the chair of English was notable for his success in teaching the technique of playwriting to his students. He was the first to introduce courses in dramatic writing in his classes, and in 1906 a course in playwriting was added to the curriculum and promising pupils from Radcliffe College and Harvard were admitted to it. These classes were known as 47 and 47a. The students wrote long and short plays which were discussed in class and, if presentable, were produced at Agassiz House at Radcliffe. Their successful production gave added impetus to the Little Theatre movement then in its infancy.

From 1907 to 1908, Mr. Baker was Hyde Lecturer at the Sorbonne, Paris, and during the World War he served on the committee on public information in the United States.

One of the earliest of Mr. Baker's pupils to achieve fame was Edward B. Sheldon, whose play, *Salvation Nell*, was produced by Mrs. Fiske in 1908. The Broadway producers were attracted to the Workshop, and among his pupils who became successful in the theatre were Eugene O'Neill, Philip Barry, Sidney Howard, and Robert Edmond Jones. The success of the playwriting course at Harvard led to the formation of such classes in other colleges throughout the country.

In 1924, Dr. Baker resigned as professor of English at Harvard and the following year accepted the post of professor of history and technique of the drama in the newly-organized department of the drama at Yale and director of the University Theatre there donated by Edward S. Harkness, which was formally opened Dec. 10, 1926. This theatre was fully equipped and to it was attached a staff of dramatists and special directors to teach the elements and technique of playwriting and production. The curriculum included, besides the instruction in playwriting, courses in the history of stage designing and costuming, lighting, criticism, and pageantry. In 1933 Professor Baker retired as head of the Department.

He was the author of *The Principles of Argumentation* (1895, new ed., 1905); *The Development of Shakespeare as a Dramatist* (1907); *Technique of the Drama* (1915); and edited *Specimens of Argumentation* (1893); *The Forms of Public Address* (1904); *Belles Lettres Series*, Section III, "The English Drama"; *Some Unpublished Correspondence of David Garrick* (1907); *The Correspondence of Charles Dickens and Maria Beadnell*; also, various Elizabethan plays; *Plays of the 47 Workshop*, series I-IV; *Yale One-act Plays*, I; *Yale Long Plays*, 4 vols. In 1921 he wrote and directed the *Pilgrim Spirit*, Massachusetts Tercentenary Pageant, produced at Plymouth, Mass., during July and August of that year.

BALI. See NETHERLAND INDIA.

BALKAN ENTENTE. A bloc of Balkan states—Greece, Rumania, Turkey, and Yugoslavia—which by the treaty of Feb. 9, 1934, mutually guaranteed their frontiers against aggression by any of the Balkan states. The treaty pledged the four governments to undertake no political action and assume no political obligation toward any Balkan country not a signatory of the pact without the consent of the other contracting parties. In general they agreed to adopt a unified foreign policy on intra-Balkan issues. The entente represented an effort to stabilize the territorial *status quo* in the Balkans and at the same time to free the Balkan states of their traditional diplomatic

dependence upon the great powers. At the fifth conference of the Foreign Ministers of the Balkan Entente held at Bucharest May 10-11, 1935, they consented to the limited rearmament of Hungary and Bulgaria, provided these two countries accepted the territorial *status quo*. They also joined forces with the Little Entente (q.v.) in declaring they would regard any move toward restoration of the Hapsburgs in Austria or Hungary, or both, as a breach of the peace treaties. In October the Balkan Entente gave strong support to the application of League sanctions against Italy. See GREECE, RUMANIA, TURKEY, and YUGOSLAVIA under *History*.

BALKAN STATES. The states of the peninsula south of the Danube, and bounded by the Adriatic, Ægean, and Black seas. See ALBANIA, BULGARIA, GREECE, RUMANIA, TURKEY, and YUGOSLAVIA.

BALTIC ENTENTE. A bloc comprising the three Baltic states—Estonia, Latvia, and Lithuania—established in 1934 for the joint protection of their mutual interests. By a treaty signed Sept. 12, 1934, and which went into effect November 30, the three governments agreed to cooperate on all matters of foreign policy, to confer together at least twice annually, to settle their mutual disputes peacefully, and to establish closer cooperation among their diplomatic representatives abroad and at international conferences. All three states had previously concluded non-aggression pacts with the Soviet Union. See ESTONIA, LATVIA, and LITHUANIA under *History*.

BANGKA. See NETHERLAND INDIA.

BANG'S DISEASE. See DAIRYING

BANKERS ASSOCIATION, THE AMERICAN. The dominant national organization of banks in the United States, having a membership of about 12,000 banks out of a total of 15,500. Its four major divisions are devoted to the special interests, technical advancement, and general welfare of the following classes of banks. National, savings, State, and trust company. There also are two sections devoted to general banking interests, the American Institute of Banking section and the State secretaries section. The former, which is the educational arm of the organization, has an enrollment of 36,000 students from banks in all parts of the country and a general membership of 65,000; the latter forms a link between the national organization and the 48 State bankers' associations.

The association's protective department prosecutes continually a nation-wide campaign of prevention, protection, and investigation for all member banks in respect to criminal operations. It also has a legal department which keeps bankers informed on developments in the field of banking law, while its State and Federal legislative committees and councils attempt to safeguard the interests of banking institutions and the public in both State and Federal banking legislation.

Through its economic policy commission and other special bodies the association conducts studies of such subjects as insurance and guaranty of bank deposits, the entry of the Federal government into banking activities, branch banking, causes of bank failures, proposed remedial legislation, supervision of the dual banking system under State and national charters, bank chartering policies, and basic changes in bank credit conditions and methods. Its public education commission conducts lectures on banking in public and private schools and before civic clubs throughout the United States, and its bank management commission develops active tech-

nological studies and methods for more scientific bank management.

The association held its 1935 convention in New Orleans, La., November 11-14. The chief topics of discussion were coöperation with the Federal government (the association having taken the lead in bringing banks into close practical coöperation with government housing and other measures), the need for the retirement of the government from fields of private enterprise, government fiscal policies, and general taxation. The national officers elected for 1935-36 were: President, Robert Vedder Fleming, president, Riggs National Bank, Washington, D. C.; first vice president, Tom K. Smith, president, Boatmen's National Bank, St. Louis, Mo.; second vice president, Orval W. Adams, vice president, Utah State National Bank, Salt Lake City, Utah; and treasurer, Arthur B. Taylor, president, Lorain County Savings and Trust Co., Elyria, O. National headquarters are at 22 East 40th St., New York City; Fred N. Shepherd, executive manager.

BANKS AND BANKING. If it had not been for the pressure of government financing, the year 1935 would probably be regarded as marking a decided turn for the better in the banking situation, as viewed historically from the standpoint of the panic and depression ensuing upon the year 1929. The year 1934 witnessed the completion of the major elements in the programme of bank reorganization which had followed after the banking holiday of 1933. While statistics have been very sparingly published with regard to bank failures, the data made public shortly before the end of 1934 showed the closing or disappearance of some 2500 banks during the years 1933-34 inclusive, while with the opening of 1935 the number of closings and mergers began to decline. During the year there was a slight indication of improvement in commercial banking business, and at some banks the daily routine began to take on a more normal complexion.

What with the reduction of bank failures and the moderate turn for the better in general business demand, the fact that banks almost uniformly showed small earnings or even a negative earnings position for the year 1935, was to be reckoned as of secondary importance. The real problem in connection with banking in 1935 was furnished by the fact that there had been no indications of a lessening of government requirements, but, on the contrary, there was every reason to think that the policy of putting government securities into the hands had by no means run its course. While the Banking Act of 1935, adopted in August, introduced several important innovations, it in the main merely improved and continued, in its final form, the legislation that had been undertaken in 1933; and while the President retained the power to devalue the dollar still further, no such step was taken.

This fact and the action of the Supreme Court in the so-called "gold decisions" of Feb. 18, 1935, which, on the whole, although somewhat hesitatingly, confirmed the action of Congress and the administration in changing the weight of the dol-

lar, tended strongly to confirm the opinion that the "New Deal" monetary policy had largely run its course—certainly for the present—and strengthened the community in the belief that business conditions were now for the first time more or less stable and hence to be moderately counted upon. Relationships with foreign countries, however, continued uncertain and the year witnessed no progress in international monetary stabilization or in the approximation of the American banking system to those of other countries in the matter of credit policy. The Act of 1935, although it introduced some important changes in the structure of the Reserve system itself, had not come into final working order during the twelve-month of 1935 but still remained as a factor in the future reconstruction of the Reserve system, its administrative provisions going into operation during the first weeks of the new year, 1936.

The experience of the national banks after 1932 had largely deprived them of any exceptional prestige or standing that they might formerly have possessed. Recognizing this fact, the administration became more than ever convinced that the restoration of the national banks to their older position was dependent upon making them obviously "sound" and "safe." The result of this feeling was the incorporation into the first draft of the Banking Act of 1935, which made its appearance about mid-winter (Feb. 18, 1935), of provisions calling for the improvement of the Federal Deposit Insurance Fund, in which the national banks were, of course, compulsory members. As finally adopted, considerable modification of these provisions of the law took place, but the outcome of the discussion was to limit the insurance of bank deposits to accounts of not to exceed \$5000, while the rate at which contributions were to be made was fixed at $\frac{1}{2}$ of 1 per cent upon demand deposits.

The question whether State banks should be compelled to comply with these requirements as well, was discussed throughout the first half of the year, and finally resulted in the provision that such State institutions should be deprived of membership in the Reserve system unless before the end of 1937 they took out insurance under the proposed insurance fund. This is evidently an indirect use of the Reserve system to compel State banks to assume the same burdens which had been imposed upon the national institutions, and was correspondingly unpopular. A considerable number of national banks left the system but their place was taken by others, so that at midyear, it was 5425 strong, as against a membership of 5417 at the opening of the fiscal year (July 1, 1934). From time to time utterance was made by the President and other members of the administration, who reassured the public concerning the condition of the national banks, furnishing expressions of opinion that in absorbing the current deficit of the government the banks were not going too far. Frequent exhortations to lend more freely and to be more helpful to the community continued to be directed toward all of the banks, but particularly toward those possessing national charters. As the year drew to a close, controversy over banking conditions became sharper, and the meeting of the American Bankers Association in New Orleans, at about the end of November, was characterized by bitter debate, unusual at the meetings of the Association, which in years past had usually presented a "cut and dried" character.

In the following table is shown the situation of the national banks at mid-year during the past few seasons. The figures show an advance in deposits, largely due to the loans made by the national institutions upon government bonds growing out of the inflation of an unbalanced Federal budget, while they also show the continued growth of excess reserve deposits at Reserve banks.

institutions was toward the working out of new lines of business calculated to afford a better field for the activities of the State banks by eliminating those branches of activity which had been largely occupied by the government itself and had thus become unprofitable. In a carefully compiled report submitted by a special committee of the New York State Bankers Association at the annual

State Banks and Trust Companies. The banking holiday had left many State banks and trust companies in a difficult situation and the Reconstruction Finance Corporation had devoted itself steadily during the latter part of 1933 and throughout 1934 to the upbuilding of the institutions which had been thus weakened, by putting in their hands fresh capital against the issue of preferred stock. In this way many State banks and trust companies had been saved from the necessity of closing and had been retained as units in the systems to which they belonged.

The opening of the year 1935 in the case of the State institutions, as in that of national, found the general attitude and tone of the community improved, although in the course of the year there had been a reduction in the total number of banks which amounted to 57, all but one of which were State institutions. These were all licensed institutions. The total number of non-licensed banks (all State institutions) placed in liquidation or receivership during the year 1934 had been 927, of which 506 were non-member State institutions. The year 1935 saw a great decline in this total, and only 30 licensed State institutions and 48 non-licensed were placed in receivership.

On the whole, the general tendency of State

convention of the association in June, 1935, such a shifting of the basis of banking was recommended as a deliberate policy, and a like point of view had been developed in various other States. During the year, the Federal Deposit Insurance Corporation began an effort, authorized by the Banking Act of 1935, adopted in August, to strengthen the general structure of banking by eliminating from it through liquidation and merger, institutions which it believed were not as strong in their capital structure as was desirable.

The midyear reporting period (end of June) found the total number of banks in existence reduced to 15,990 as against 16,024 at the last preceding reporting date; while during the latter part of the year bank closings and retirements from the Reserve system reduced both the aggregate number of banks and the number of members. Losses were particularly noteworthy among national banks and were aggravated during the latter months of the year by the fact that not a few national institutions surrendered their charters and entered the State systems. On the whole, the year's development tended quite strongly toward the shifting of banks into State systems and the emphasizing of trust operations as compared with commercial, while the year also had the effect of

confirming in the State banks, as in the national, the tendency to give a place of preponderating importance to government bonds in the portfolios of the different institutions. The table at the foot of page 70 presents the salient features in the trust company development

National Banks. National banks had not shown material difference in development as compared with State and private institutions during the past few years, nor had they since the beginning of the depression given evidence of that superior strength and soundness which had been customarily attributed to them. The year 1935 was chiefly interesting in their growth for the continuous absorption by the national banks, at the request of the Treasury Department, of large quantities of government notes, bills, and bonds, and, at the same time, for the final organization of the Federal Deposit Insurance Corporation, entrusted with the mission of guaranteeing the deposits of the national banks and of such State banks as might choose to adhere to the Federal Reserve system

The adoption of the Banking Act of 1933 had given the signal for the installation of two so-called systems of funds designed for the guaranty of bank deposits—the first, the so-called “temporary fund”; the second, the “permanent fund”;—the first intended to apply to deposits below \$5000 and the other intended to provide for all deposits. From the beginning of the year, it was the demand of the banks and especially the national banks that this situation should be modified and that the so-called permanent fund when it came into definite existence should be limited to deposits of \$5000 and under,—the larger deposits being thus left to take care of themselves unless their owners chose to break them up into a series of accounts not one of which was in excess of \$5000 balance

Fearing that no such modification of the act would be possible, not a few national banks withdrew from the Reserve system and gave up their charters, while still others have made all necessary preparations to go out of the system. The final adoption of the modified depositors' guaranty provision, in August, relieved these apprehensions and left the banks in very much the same position as before, with a tax of $\frac{1}{2}$ of 1 per cent levied upon the net deposits of all contributing banks, regardless of the average size of their deposits,—the Federal Deposit Insurance Corporation assuming the liability of deposits of \$5000 or less in the event of failure. This action served to hold the national banks practically in status quo, and the close of the year found them only moderately altered in numbers.

Another outstanding feature of the year was the announcement of the Treasury's intention to retire the national bank notes which were still outstanding, amounting to some \$680,000,000, by the use of a corresponding amount drawn from the “profit” which had been made by the devaluation of the dollar. This operation was carried through and the national bank notes disappeared as a factor in American currency. Their place was taken so far as currency was needed, by issues of Federal Reserve notes. With this change the national banks still further lost their distinguishing characteristics and became, in effect, identical with the State institutions which were members of the Federal Reserve system. The major statistical changes occurring in national bank portfolios dur-

ing 1935 are presented in the accompanying table (000,000 omitted).

MAIN ASSETS AND LIABILITIES OF REPORTING MEMBER BANKS [000,000 OMITTED]

Federal Reserve Notes. The year 1935 brought little change to the actual operations of the Federal Reserve system. Actual rediscounting from members continued to be small and even reached a new low point, some increase in the industrial discounting activities of the Reserve banks took place but these operations were always unimportant and continued to be so. The large portfolio of government securities, amounting to \$2,430,000,000, which Reserve banks had been carrying during the year, was maintained intact, notwithstanding continuous discussion as to the best method of getting rid of these frozen assets

The table on page 72 reflects the status of the twelve Reserve banks at the close of the year as compared with the corresponding status a year earlier.

Discount policies remained practically stable throughout the entire year 1935. The constant pressure for easy money applied by the Treasury in the effort to keep the cost of its own financing down to a very low level had been reflected in the action reducing the rate at the Federal Reserve Bank of New York to $1\frac{1}{2}$ per cent, while other Federal Reserve banks had followed the New York example by cutting their rates at various dates during the spring of 1935. At the close of the year no rate for ordinary rediscounts at Federal Reserve Banks was above 2 per cent, with New York and Cleveland at $1\frac{1}{2}$ per cent each. The low rates, however, did not stimulate the growth of member bank borrowing; and during the year, although a feeble upward trend was observable, the aggregate of business paper for the close of the twelve-month was only about \$3,400,000,000 at reporting member banks,—a slight advance of less than \$200,000,000 above the status of a year previous. Loans to brokers continued low and at the end of the year were around \$850,000,000, a gain of only about \$25,000,000 during the twelvemonth, notwithstanding that there had been very decided activity in the stock market.

Nevertheless, the great upswing in the turnover of the stock market led during the autumn months

to continuous consideration by the governing authorities of the Reserve system of the question,—whether some kind of “credit control” ought not to be applied. Ever since the beginning of 1934 there had been a tendency on the part of member banks to carry with Reserve banks very much larger balances than were required by the provisions of law. These so-called “excess reserves” had, by the close of November, reached the enormous sum of about \$3,000,000,000, and there was widespread opinion to the effect that they constituted a menace, as they evidently provided an existing fund of credit which could be drawn without further application to or permission of the various banks by those who were desirous of financing large stock market operations. Fears under this head gave rise to lengthy consideration of the subject at meetings of the Board of Governors and of the Open Market Committee of the system in Washington, and finally led to the publication of a statement of opinion by the Governor of the Federal Reserve Board in which he expressed the view, there was nothing that could or should be done in connection with the control of credit for the time.

The Banking Act of 1935, adopted August 19, had authorized the raising of Reserve requirements to not over double the then existing level. The proposal to have the Board take some action under this grant of authority was particularly dis-

tasteful to the governor of the Reserve Board, in the statement already referred to he described it as being a useless and undesirable remedy. After the publication of his statement, the Advisory Council of the Federal Reserve system passed a resolution requesting that the Federal Reserve Board direct Reserve banks to reduce their line of government securities but with the general understanding that both the governor of the Reserve Board and, indeed, the Board itself was opposed to permitting any such action to be taken. General uncertainty in the Federal Reserve system prevailed throughout the latter part of the year due to the fact that the act of revision adopted in August had provided for terminating the service of the old members of the Federal Reserve Board, early in 1936;—they to be succeeded by a new Federal Reserve Board taking office on the first of March, the Secretary of the Treasury and the Comptroller of the Currency being, by law, dropped from membership in the governing body.

Bank Credit. As we have fully noted, there had been continuous political urgency to have the banks lend more freely and more cheaply; and nearly all of the higher government authorities had been steadily preaching the necessity of more credit and the ease with which the banks could relieve the situation by enlarging the accommodations which they hoped to extend. Total deposits on the books of the banks continued to grow larger

as a result of the action of the Treasury in discounting more and more paper which were paid for by the writing up of bank credit on the books of the member institutions. As a result it was noted with satisfaction by politicians that the average deposit level had been forced back to about the same point as was reached prior to the panic of 1929; but critics of every kind were quick to observe that these "deposits" were nothing more than the book representatives of government bonds and had no relation whatever to the volume of business likely to be developed.

On the other hand, the credit extended by government institutions of all sorts, of which some 25 had now been brought into existence, with 17 reporting monthly considerable amounts as periodically shown in the Federal Reserve Bulletin, was steadily enlarged, and toward the end of the year amounted to fully \$13,000,000,000.

The President of the Reconstruction Finance Corporation, in addressing the American Bankers Association at the annual convention at New Orleans about the end of November, took occasion to deny that there was any desire on the part of the government to remain in the banking business although he admitted that at that time the government was the proprietor of preferred stock in some 6000 institutions. This stock, said Mr. Jones, could be paid off at any time the banks felt disposed. He, however, later issued a letter to banks in which he explained that he had not meant to suggest or urge the early payment of the stock; indeed, that the various institutions could take their own time about it. Toward the close of the year, the question became more and more acute in many minds, whether in fact the "left wing" of the administration had not definitely determined upon a policy of "socialization of banking." The close of the year thus found the general credit position in greater confusion than had been the case for several years.

Bank Failures. With the advent of the Federal Deposit Insurance Corporation, the subject of bank failures had become a very sore one in administrative circles. The managers of the Insurance Corporation were naturally desirous of forestalling such failures and thereby easing the possible strain that might be brought to bear upon the insurance enterprise, while they, of course, felt keenly the aspersions directed against the Insurance Corporation when failures occurred. The year 1935 had produced comparatively few failures, the total number reported by the Reserve System up to the end of the year being 29; but it was well understood that numerous institutions that might otherwise have closed, had been prevented from doing so by issues of second preferred stock or enlargements of the preferred stock which they already had outstanding. Effects among the State systems to "clean up" local banking systems resulted in many cases in closing certain banks, although in the case of others "mark-ups," rendered possible by the fact that in 1932 assets had been too severely marked down, gave sundry institutions a false appearance of prosperity. These "mark-ups" in certain cases brought about a rise of the current quotation of the stock of the bank,—a phenomenon which was not very carefully analyzed by the public, and thus led some to the erroneous belief that conditions were growing "more prosperous."

Late in 1935 the Federal Deposit Insurance Corporation initiated a "drive" to bring about the extinction through mergers or combinations of

"weak" banks throughout the country, a policy which placed unnecessarily severe pressure on not a few of the smaller institutions. Although the advance of securities and particularly of second grade bonds during the year improved the balance sheet position of a considerable number of banks, it could not be said that during the twelvemonth there had been any very genuine improvement in banking conditions generally; while the steady growth of the enormous burden of government bonds and other securities in the different institutions, instead of producing the much desired liquidity, had merely made these institutions wholly dependent upon the financing of the Federal government.

International Relationships. International banking has been fully discussed elsewhere (see INTERNATIONAL BANKING). Here we need only note the general changes in the world position of the banking system itself. The year 1935 was a continuation of the anxieties and doubts that previously existed with regard to monetary relationships all over the world, so that both banks and large business houses were less and less willing to maintain balances in foreign trade, expressed in terms of the local currencies of those countries. This unwillingness created a distinct instability of relationship which grew more severe as time went on, and as the apparent danger of devaluation or suspension of specie payment by countries of the "gold bloc" increased.

Foreign financing in the United States, for reasons already sufficiently rehearsed, became less and less frequent, while foreign branch banks, owned by American institutions continued to be closed, either due to political changes abroad or lack of profit, or exchange fluctuations. A like tendency was witnessed with regard to the operations of branches established by foreign banks in New York. The movement of foreign funds toward the United States, as already elsewhere noted, continued active, being reflected in the enormous movement of gold into the United States, which for the year ran well up above \$1,887,000,000; while heavy purchases of American stocks for foreign account continued to take place.

During the last quarter of the year the total amount of foreign buying in the New York market was often as much as 10 or 12 per cent of the entire business on specified days. Further application of the silver buying policy of the government first resulted in forcing up the price of domestic silver to a high level of 77 cents an ounce, while the influence of Treasury buying in the foreign market advanced the price of foreign silver to about 67 cents an ounce. Early in the year the application of the price of silver had driven Mexico off the silver standard, while later on it was the motivating cause of a substitution of a managed paper currency on the coast of China. The currency disorders occurring in various parts of the world as a result of American silver buying led, just at the close of the year, to a suspension of purchasing on the London market and the statement that the Treasury would henceforward confine its purchases to silver-producing countries. This reversal of policy did not, however, bring about any satisfactory improvement in the bullion market, which continued to be disturbed and irregular up to the close of the year, with unaccountable fluctuations which resulted only to the advantage of the speculative elements.

Discussion and Criticism. During the first half of the year the major foundation for discus-

sion of banking conditions was furnished by the so-called Eccles bill, reference to which has already been made in the present article in various connections. The Eccles bill had not only broadened and confirmed the Federal Deposit Insurance system, altered to some extent the management of the Reserve system, and changed the conditions of rediscounting, but it also revealed the general banking policy of the administration of the nation, as had never been done before. It revealed the so-called "New Deal" as a scheme for continuous inflation and an attempt at control of prices through banking manipulation, one incidental end being the appropriation of large fortunes and the making of gifts and inheritances so expensive as to be hardly worthwhile (see PUBLIC FINANCE).

The failure of the act to pass in its original form was reached only after a bitter discussion, most of it behind the scenes, in which the Roosevelt administration came to realize that it had gone too far and that it must take a less advanced position. The best thing about the controversy was the fact that it tended to focus the attention of the banking community upon various phases of existing financial organization which had previously had much less study than they were entitled to, and one result of the debate was the revival of an interest in banking conditions which had seemed to be almost dead during the preceding two years. The extraordinarily submissive attitude which had been forced upon the banks ever since the holiday in 1933 seemed to be ended, and during the autumn months conspicuous bankers turned their attention to the question whether the policy of the Treasury Department and its effort to transfer the whole national deficit to the banks was not likely to prove dangerous—even suicidal.

Stabilization Fund. As has been noted in former issues of the YEAR BOOK, Congress had provided for a Stabilization Fund, by the act of Jan. 30, 1934, and this Stabilization Fund had been tentatively used for the purpose of controlling exchange. The year 1935 witnessed a considerable expansion and enlargement of its operations along the lines of the British Equalization Fund. Pressure on the French franc made itself definitely felt in the very early spring of 1935 and was followed by a change of front on the part of the Treasury, the Stabilization Fund being continuously used for the purpose of bolstering the franc and assisting the Bank of France to supply gold. Similar application of the services of the fund have been in connection with the troubles in Belgium, especially for the purpose of easing the transition of Belgium to a new standard of value, which occurred in the early spring. The Stabilization Fund was also employed in the effort to keep the British pound sterling high at a figure just below \$5, and at a quotation that varied only slightly from day to day.

Originally Congress had limited the operation of the Stabilization Fund to two years, which would have ended it on Feb. 1, 1936, but as the close of the year 1935 drew near, it became more and more evident that the politicians had made up their minds to secure a further extension of it. The public began to reckon with it then as a more or less continuing element in Federal monetary policy and to expect of it the smoothing out of exchange fluctuations such as might occur from month to month. As no accounts of the operation of the fund were ever published, the year 1935 end-

ed with the general status of the undertaking still obscure to the rank and file of financial authorities.

BAPTIST CONVENTION, NORTHERN. This body of the Baptist denomination, according to the *Annual of the Northern Baptist Convention*, was composed in 1935 of 36 conventions in 33 States, the District of Columbia, and Puerto Rico. It reported 406 local associations, 7741 churches, nearly 9000 ordained ministers, 59,067 baptisms during the year, 1,480,231 members, 6272 Sunday schools, and 1,131,927 Sunday school pupils. Church property was valued at \$218,473,366. The contributions for current expenses amounted to \$12,926,668, and for beneficence to \$3,069,397.

The twenty-eighth annual meeting of the Northern Baptist Convention was held in Colorado Springs, Colo., June 20-25, 1935. Its general theme was "I Am Recreating All Things," the keynote address being delivered by the Rev. Avery A. Shaw, D.D., president of Denison University. The officers elected for 1935-36 were: President, the Rev. James H. Franklin, D.D., president of Crozer Theological Seminary; first vice-president, Rev. Gordon Palmer, D.D. Pomona, Calif.; second vice-president, Mrs. Jessie Burrall Eubank, Cincinnati, Ohio; corresponding secretary, the Rev. Maurice A. Levy, D.D., Williamsport, Pa.; recording secretary, the Rev. Clarence M. Gallup, D.D., New York, N. Y.; and treasurer, Orrin R. Judd, New York, N. Y.

In 1935 the Northern Baptist Convention maintained 64 educational institutions, including 10 theological seminaries, 6 training schools, 19 colleges, 10 junior colleges, 12 academies, and 7 Negro schools. These institutions had 32,667 students, 2924 instructors, 738 buildings, property aggregating \$111,324,686 in value, endowments valued at \$161,100,885, and an annual income for the year of \$18,683,266. The leading denominational papers were *Baptist Banner* (Parkersburg, W. Va.); *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Iowa), and *Watchman-Examiner* (New York, N. Y.).

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, with 610 missionaries. In 1935, churches numbered 3226 with 352,413 members; native workers, 10,529; Bible schools, 2916 with an enrollment of 119,351 pupils; and hospitals and dispensaries, 84. The field of the home mission societies included, in addition to the United States and its dependencies, Mexico, the West Indies, Central America, the Canal Zone, and South America. Their greatest activity was among the Negroes, Indians, and new Americans. The denomination also maintained 7 hospitals, the largest being the New England Baptist Hospital in Boston and the Northwestern Baptist Hospital in St. Paul, 16 homes for the aged, and 15 children's homes.

Headquarters of the General Council, the executive body to which is entrusted the work of the convention between annual meetings, are at 152 Madison Avenue, New York, N. Y. In cooperation with its subsidiaries, the Council of Christian Education, the Council of Finance and Promotion, and the Council on World Evangelization, it administers the unified missionary and educational interests of the denomination and, together with some 20 other committees, conducts the principal convention affairs. Two major boards are the Board of Education, which with assets of approximately \$220,000 cares for the work and property

of the denominational schools and colleges, and the Ministers and Missionaries Benefit Board, which with assets of over \$20,000,000 supervises the pension and emergency aid work for ministers, missionaries, and their dependents. The American Baptist Home Mission Society is situated at 23 East Twenty-sixth Street, New York, N. Y.; the Baptist Young People's Union of America, at 203 North Wabash Avenue, Chicago, Ill., and the American Baptist Publication Society, at 1701 Chestnut Street, Philadelphia, Pa.

BAPTIST CONVENTION, SOUTHERN This body of the Baptist denomination was formed in 1845, when Southern Baptists withdrew from the national organization on account of the slavery issue, also for the better administration of the work of the Convention. Since that time it has functioned, not as a new denomination, but as a separate organization for the purpose of directing missionary and general evangelistic work in the white Baptist churches of the Southern and Southwestern States.

According to the official *Handbook* for 1935 the Southern Baptist Convention was composed of 18 State conventions, which reported 24,360 churches, 23,272 ordained ministers, 209,364 baptisms during the year, 4,277,052 church members, 22,072 Sunday Schools, 3,104,411 Sunday School pupils, and 33,864 Baptist Training Unions with a membership of 649,773. Church property was valued at \$202,095,794. The contributions for current expenses and beneficence totaled \$24,653,276. The receipts of the convention's boards in 1934 were as follows: Southern Baptist Foreign Mission Board (Richmond, Va.), \$907,475; Southern Baptist Home Mission Board (Atlanta, Ga.), \$320,031; Sunday School Board of the Southern Baptist Convention (Nashville, Tenn.), \$1,703,885; and Old Ministers Relief and Annuity Board (Dallas, Texas), \$620,737.

The denomination maintained 73 schools and colleges, including 5 theological schools, 29 senior colleges, 21 junior colleges, and 18 academies, with a total enrollment of 27,253 students, 1814 ministerial students, and 1645 instructors. The educational endowment amounted to \$22,437,582, and property was valued at \$34,964,021. It also reported 24 hospitals (two fostered by the Southern Baptist Convention and 22 by the State conventions), valued at \$13,832,745 and treating 81,449 patients during the year, 19 children's homes, with property value of \$5,244,896 and accommodating 4611 children; and three homes for the aged.

The annual session of the Southern Baptist Convention was held in Memphis, Tennessee, May 15-18, 1935. The various boards and agencies of the convention showed decided gains in receipts for the year. The Baptist 100 Thousand Club enlarged its operations, giving greater emphasis to the work of the Promotion Committee of Southern Baptists. The committee sponsored an "Every-Member Canvass" during the week of November 24-Dec. 7, 1935, with the objective of securing weekly subscriptions totaling \$40,000,000. Of this amount \$9,000,000 was to go to the support of the various missionary, educational, and benevolent enterprises of the convention, while the remainder was to care for the local work of the churches. The officers elected for 1934-35 were: The Rev. John R. Sampey, D.D., LL.D., of Louisville, Kentucky, president; the Rev. Frank Tripp, D.D., of St. Joseph, Missouri, and the Rev. J. R. Hobbs, D.D., of Birmingham, Alabama, vice presidents; the Rev. Hight C. Moore, D.D., Litt.D., of Nashville, Tennessee, and the Mr. J. Henry Burnett of

Macon, Georgia, recording secretaries; and the Rev. Austin Crouch, D.D., of Nashville, Tennessee, executive secretary. Headquarters are at 161 Eighth Avenue, North, Nashville, Tennessee.

BAPTIST CONVENTION OF AMERICA, NATIONAL (NEGRO). For the fiscal year ending Aug. 30, 1934, the National Baptist Convention of America reported 1420 associations, with 61 affiliated State conventions. There were 21,692 ordained ministers and a membership of 3,691,525. There were 21,182 organized Sunday schools, and the Baptist Young People's Unions had an enrollment of 2,308,265. Contributions from all sources amounted to \$6,022,908. The next session of the Convention was to be held in Columbia, So. Carolina, in September, 1936. The president in 1935 was the Rev. G. L. Prince, D.D., Galveston, Tex.; secretary, the Rev. C. P. Madison, D.D., Norfolk, Va.; and treasurer, the Rev. A. A. Lucas, D.D., Houston, Tex. Denominational headquarters are at the National Baptist Publishing Board, 523 Second Avenue North, Nashville, Tenn.

BAR ASSOCIATION, AMERICAN. A national organization, founded in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members.

The Association's fifty-eighth annual meeting was held in Los Angeles, Calif., July 16-19, 1935. Scott M. Loftin, the retiring president, spoke at the opening session on "Independence of the Judiciary." Other addresses were made by Benjamin Wham, on "The Barrister and the Solicitor in British Practice. The Desirability of a Similar Distinction in the United States." Earl Warren, Roscoe Pound, George Z. Medalie, and Justin Miller participated in a symposium on "Criminal Law and Its Enforcement." The general topic of "Professional Ethics and Disciplinary Procedure" was discussed by Judge John J. Parker, Charles P. Megan, and Judge Orie L. Phillips. A discussion of "Better Organization of the Bar" was participated in by Jefferson P. Chandler, Walter P. Armstrong, Carl B. Rix, Charles E. Clark, Earle W. Evans, Harry P. Lawther, Frank E. Atwood, and James Grafton Rogers.

Preceding and during the annual meeting there were held sessions of the following sections of the association: Criminal law; insurance law; international and comparative law; judicial; junior bar conference; legal education and admissions to the bar; mineral law; municipal law; patent, trademark, and copyright law; public utility law; and real property law. The Commissioners on Uniform State Laws, the Conference of Bar Examiners, and the National Association of Attorneys-General also met on this occasion.

The membership of the association in 1934 was approximately 28,000. Its official organ is the *American Bar Association Journal*. William L. Ransom of New York City, was elected president for 1935-36, John H. Voorhees of Sioux Falls, S. D., was reelected treasurer and William P. MacCracken, Jr., of Washington, D. C., secretary. Headquarters of the association are at 1140 North Dearborn Street, Chicago, Ill. See LAW.

BARBADOS, bar-bā-dōz. A British West Indian colony east of the Windward Islands. Area, 166 sq. miles; population (Jan. 1, 1935), 182,440 of whom 15,200 were in Bridgetown, the capital and chief port. In 1934, births totaled 5380; deaths, 4176; marriages, 1011.

Production and Trade. The staple products were sugar and cotton. The output of sugar for 1934-35 totaled 80,500 tons (including molasses in terms of sugar). Rum produced (1934) amounted to 267,363 proof wine gallons. In 1934, total imports were valued at £1,914,554; total exports were £1,479,277. Canada received 76 per cent of the domestic exports and Great Britain 12.8 per cent. Sea Island cotton produced in 1935 totaled 40,810 lb.

Government. For the fiscal year ended Mar. 31, 1935, revenue amounted to £479,960; expenditure, £414,109; public debt, £267,920; sinking fund, £45,905. Government was vested in a governor aided by an executive council, an executive committee, a legislative council of 9 members (appointed by the King), and a house of assembly of 24 members (elected annually by the people). Governor in 1935, Sir M. A. Young.

BARBUSSE, bār'bus', HENRI. A French writer, died in Moscow, U.S.S.R., Aug. 30, 1935. Born at Ausnières, France, May 17, 1874, he was educated in the classics and philosophy at the Collège Rollin in Paris and at the Sorbonne. At the close of his studies he entered journalism, and in 1893 won a prize for poetry offered by *L'Echo de Paris*. In 1895 he produced *Pleureuses*, his first volume of poems. Shortly afterwards he became the publishing secretary of the house of Pierre Lafitte, and later was the literary director of Hachette. In 1910 he edited the magazine *Je Sais Tout*.

At the outbreak of the World War, Barbusse enlisted with the 231st Infantry, was wounded three times, and twice cited for bravery. In 1916, he published *Le Feu*, which won him fame overnight. It dealt with the war from the poilus' viewpoint, and depicted the crudeness and brutality of trench life. In 1917 the book was awarded the Prix Goncourt, although condemned by the Government for its defeatism. At the close of the War, M. Barbusse was a dyed-in-the-wool pacifist.

Le Feu was followed by *Clarté* and *La Lueur dans l'abîme, ce que veut le groupe Clarté*, both of which continued the author's purpose of using art as a vehicle for social regeneration. Subsequently, he organized the Clarté movement, which sought to group together the writers of the world and interest them in the social and political progress of humanity. Also he became one of the editors of *L'Humanité* a French radical newspaper. Together with Paul Vaillant Couturier, Raymond Lefebvre, and others, he aided in forming the Republican Association of Former Combatants, which was largely responsible for bringing about the split in the French Socialist Party, that resulted in the formation of the Communist Party in 1920. In 1923 he joined the Communist Party, and thereafter spent much time in Soviet Russia, which he said he found to be the only country where freedom and true pacifism existed. He visited the United States in 1933 and when in New York City addressed a large meeting under the auspices of the United States Congress Against War. At the time of his death he was attending the Seventh Congress of the Communist International in Moscow.

His works, many of which were translated into English, include: *Les Suppliantes* (1903); *L'Enfer* (1908); *Nous autres*, short stories (1914); *Quelques Coins du Cœur* (1921); *Le Couteau entre les Dents* (1921); *Les Enchaînements* (1925); *Les Bourreaux* (1926); *Force* (1926); *Jésus and Les Judas de Jésus* (1927); *Fait Divers* (1928); *Voici ce qu'on a fait de la Géorgie* (1929); *Russie, Ce qui*

fut sera Elevation (1930); *Zola* (1932); *Stalin* (1935).

BARLEY. The 1935 barley production of 36 countries reporting to the International Institute of Agriculture, exclusive of the Soviet Republics and countries south of the equator, was estimated at 1,291,849,000 bu., 10.1 per cent above the production in 1934 and 3.9 per cent below the average for the five years 1929-33. The barley area of these countries in 1935 was reported at 60,315,000 acres, an increase of 11.2 per cent over that of 1934 and only slightly under the five-year average. The yields of the leading countries outside of the United States were reported as follows: Germany 154,107,000 bu., Spain 91,068,000 bu., Canada 87,512,000 bu., Japan 78,610,000 bu., and Poland 65,616,000 bu. The Soviet Republics reported a yield of 360,470,000 bu. in 1934 and Argentina a yield of 42,714,000 bu. in the crop year 1934-35.

The 1935 barley crop of the United States estimated by the Department of Agriculture at 292,249,000 bu., was nearly two-and-one-half times the crop of 118,348,000 bu. in 1934 but was only slightly above the average of 282,841,000 bu. for the five years 1928-32. The area harvested in 1935 was 12,858,000 acres compared with 7,095,000 acres in 1934 when drought and heat reduced both yield and acreage. The larger part of the 1935 increase in acreage occurred in Minnesota and the Dakotas. The average yield per acre for 1935, 22.7 bu. compared with 16.7 bu. in 1934, was practically the same as the average of 22.6 bu. for the 10 years 1923-32. The 1935 farm price based on preliminary estimates was 38.1 cents per bu. and the average price for the crop marketing season of 1934, 68.3 cents. The 1935 barley production of the leading States was reported as follows: Minnesota 58,752,000 bu., North Dakota 45,558,000 bu., South Dakota 43,130,000 bu., California 36,642,000 bu., and Wisconsin 25,878,000 bu. During the fiscal year ended June 30, 1935, the United States exported 4,050,000 bu. of barley and 83,000 bu. of malt and imported 7,824,000 bu. of barley and 131,898,000 lb. of malt. The Missouri Agricultural Experiment Station has developed a variety of winter barley of superior winter resistance and of early maturity.

BARUS, CARL. An American physicist, died at Providence, R. I., Sept. 20, 1935. Born in Cincinnati, Feb. 19, 1856, he was graduated from the School of Mines, Columbia University, in 1876, and subsequently went to Germany to attend the University of Wurzburg, where he studied experimental physics under Professor Kohlrausch from 1876 to 1880 and received his doctor's degree, *summa cum laude*, in 1879. Returning to the United States in 1880 he became associated with the U. S. Geological Survey as a physicist engaged in special research, but in 1892 that work was discontinued by Congress. Then he joined the U. S. Weather Bureau and served for a year as professor of meteorology, which service was also discontinued. From 1893 to 1895 he was a member of the staff of the Smithsonian Institution, when he accepted the Hazard professorship of physics at Brown University, and retired therefrom as emeritus professor in 1926. He became dean of the Graduate Department in 1903, and served until 1926.

As one of the foremost physicists in the world, Dr. Barus was appointed member of a congressional committee of seven appointed in 1894 to draw up the specifications for the electrical standards of the United States. He was elected a non-resident fellow of the American Academy of Sciences of Massachusetts in 1890 and three years later to the National

Academy of Sciences. He served as vice president and chairman of the section of Physics of the American Association for the Advancement of Science in 1897, and became a corresponding member of the British Association for the Advancement of Science. In 1902 Dr. Barus was appointed a member of the advisory committee of Carnegie Institution. As President of the American Physical Society in 1904 he represented American physics at the World Congress at St. Louis. Also, in that year he received the Rumford medal of the Academy of Arts and Sciences for his work in developing methods for high temperature and high pressure measurement, and the application of these methods to problems concerning the dynamics of the earth's crust, the age of the earth, and the determination of its internal state of fusion. In 1905 and 1910 he was a member of the honorary committee of the International Congress of Radiology.

As an author he produced many books and pamphlets which set forth the results of his original experiments in physics, particularly in the field of thermodynamics, magnetism, and laws of gases. Among them may be mentioned: *The Electrical and Magnetic Properties of the Iron Carburets* (1885); *Physical Properties of the Iron Carburets* (1886); *The Measurement of High Temperatures* (1889); *Viscosity of Solids* (1891); *Die Physikalische Behandlung Hoher Temperaturen* (1892); *Compressibility of Liquids* (1892); *Mechanism of Solid Viscosity* (1892); *Volume Thermodynamics of Liquids* (1892); *High Temperature Work in Ignecous Fusion* (1893); *Condensation of Atmospheric Moisture* (1895); *Experiments with Ionized Air* (1901); *The Structure of the Nucleus* (1902); *Nucleation of the Atmosphere* (1905); *Nucleation of the Uncontaminated Air* (1906); *Condensation Induced by Nuclei and Ions* (4 vols., 1907-10); *Elliptic Interferences* (3 vols., 1911-15); *Diffusion of Gases through Liquids* (1913); *Interferences of Reversed and Non-reversed Spectra* (4 vols., 1916-19); *Interferometer Experiments in Acoustics* (3 vols., 1921-25); *Acoustic Experiments with Pin-Hole Probe and the Interferometer* (1927). In 1899, he edited *The Laws of Gases*.

BASEBALL. The Detroit Tigers, led by Mickey Cochrane, again won the American League pennant in 1935 and this time succeeded in taking the World Series, the first time in the history of baseball that the highest honors in the sport had rested in Detroit. But it was in the National League that the thrills of the campaign were retained. As in 1934, the New York Giants seemingly had the National League pennant safely wrapped up in the early summer, but again the Giants tumbled from the lead when their hitters failed to find the range and their fine pitching staff stumbled. The St. Louis Cardinals, 1934 winners of the World Series, then took the lead but they, too, tumbled in the closing days, succumbing before an inspired rush of the Chicago Cubs, who hurtled into the lead on a winning streak of 21 straight games. This long winning streak enabled the youthful Cubs, managed by the veteran Charley Grimm, to burst past both the Giants and Cardinals and win the pennant in the final two days of the campaign. The last two games of the winning streak were employed in beating the fading Cardinals twice, the first victory clinching the flag.

The Tigers won their pennant by an eight game margin over the New York Yankees, who threatened with the Chicago White Sox in the early days of the season, but who faltered before the

excellence of the Detroit nine. The Tigers won the World Series with a smashing display in six games. Cochrane, Tommy Bridges, Goose Goslin, Charley Gehringer, Hank Greenberg, and Schoolboy Rowe were the particular bright lights of the Detroit team. The Tigers sliced the largest World Series purse in history, each Detroit member receiving \$6544 as his share of the booty.

Aside from the actual races in both leagues, the Boston Braves provided the most entertainment. They started the race in financial difficulties, when Judge Emil Fuchs, their owner, was banned by the National League owners from running dog races in Braves Field. Fuchs then obtained the services of Babe Ruth from the Yankees, but Ruth's playing was mediocre and his position as vice-president of the club meaningless. He left the Braves in mid-season and the Boston entry proceeded to set a major league record, losing 115 games in the campaign. Ruth thus was let out of baseball after a most glorious career. Late in the year Fuchs was ousted and at the December meeting of the League, Bob Quinn resigned as business manager of the Brooklyn Dodgers and, with backing supplied by Charles F. Adams, was made president of the Braves for 1936.

Floyd (Arky) Vaughan, Pittsburgh short-stop, won the batting crown of the National League with a .385 average, and Charles (Buddy) Myer of the Washington Senators took the American League crown with .349, the lowest top average in 27 years. Jimmy Foxx, of the Philadelphia Athletics, tied with Greenberg of the Tigers for the American League home run honors, each making 36. Walter Berger, Braves outfielder, was best in the National League with 34. Darrell (Cy) Blanton, a newcomer to the major leagues and a pitcher for the Pittsburgh Pirates, was the most effective hurler of the National League, with Bill Lee of the Cubs and Dizzy Dean close up. Bob Grove, of the Red Sox, staged a remarkable comeback to lead American League pitchers.

Trades were consummated after the season, the news being the strengthening of the Boston Red Sox by the seemingly inexhaustible bankroll of Tom Yawkey, their young owner. Besides purchasing Foxx from the Athletics Yawkey also acquired Johnny Marcum, a pitcher, Eric McNair, infielder, and Roger Cramer, outfielder. The Tigers bought Al Simmons, outfielder, for \$75,000 from the Chicago White Sox, and the Giants acquired Burgess Whitehead, second baseman, from the Cardinals.

Montreal's Royal won the International League pennant, and Minneapolis was first in the American Association. There was no Little World Series in 1935 but late in the year the magnates voted to resume the post-season event in 1936. Atlanta won the Southern League championship and the title in the Pacific Coast League went to the San Francisco Seals. Oklahoma City won the Texas League race and also captured the Dixie Series. Dartmouth was supreme in the Eastern Intercollegiate League and the University of Minnesota won in the Big Ten. Holy Cross had the best record in intercollegiate competition, winning 22 of 23 games played. Gastonia defeated Sacramento for the American Legion junior championship.

BASKETBALL. Introduced into Madison Square Garden in New York where tremendous crowds attended college doubleheaders staged by Ned Irish, the sport of basketball experienced an impressive advance in 1935, which late in the year was furthered by the announcement that

the game would be played in the 1936 Olympic games for the first time in the history of the quadrennial games. Teams from all sectors of the country were brought into the Garden, and the different styles of play as well as the different interpretations of the rules by officials from other districts were carefully scrutinized. A few less than 100,000 persons paid to see the intersectional and intricacy contests and to start the new campaign in December, 17,462 spectators turned out to watch New York University beat the University of California and St. John's University defeat Westminster.

Attendance records were shattered in the South-eastern Conference where Louisiana State and Kentucky, which did not meet, tied for the title with unblemished records. New attendance peaks were reached in the Western Conference, which developed a three-way tie for the championship among the defenders, Purdue, Illinois, and Wisconsin. And greater crowds watched the Southern Conference tournament from which North Carolina emerged victor over the defending champion, Washington and Lee. Ties for league and conference title were unusually numerous. Southern Methodist, Rice, and Arkansas topped the Southwestern Conference and Drake and Creighton split Missouri Valley honors. The University of Pennsylvania five, 1933-34 champion, retained the Eastern Intercollegiate League laurels when Bob Freeman gave Penn a one-point margin in the final second of the play-off game. Pittsburgh won the Eastern Conference race. But Eastern honors as well as most serious consideration for national honors went to New York University, which despite an unexpected defeat by Yale, a quintet hapless in other games, won 19 of 20 games, numbering among its victims such powerful teams as Notre Dame, Kentucky, Georgetown, Temple, Navy, and Rutgers. Long Island University was another strong team, winning 24 of 26 games and scoring more than a thousand points. The Kansas City Stage Lines A.A. took the National A.A.U. championship and the women's honor's went to the Tulsa Stenos A.A.

BASQUE PROVINCES. The north central Spanish provinces of Alava, Guipúzcoa, and Vizcaya (Biscay). Total area, 2739 sq. miles; population 929,739 (Jan. 1, 1934 estimate). The province of Navarra, which had a large Basque population, was not a part of the Basque Provinces. See SPAIN under *History*.

BASUTOLAND, ba-sōō'tō-lānd'. A native territory in South Africa. Area, 11,716 sq. miles; population estimated at 570,000 compared with 498,781 in the 1921 census. Maseru, the capital, had 2319 inhabitants (1921) including 1890 natives. During 1934 there were 810 elementary and primary schools (including 10 institutions for specialized training) with a total of 71,764 students enrolled.

Production and Trade. Maize, kaffir corn, and wheat were the main grain crops. Wool, mohair, and cattle were other important products. Livestock (Jan. 1, 1935): 1,673,800 sheep; 544,850 goats; 400,000 cattle; 75,350 horses; 15,000 donkeys, and 1100 mules. In 1934, imports were valued at £566,767 exclusive of government imports of £62,550; exports, £284,522 of which wool (5,093,858 lb.) represented £118,744; wheat, £88,919; livestock, £55,960; hides and skins, £6605.

Government. For 1933-34, revenue amounted to £246,144; expenditure, £292,114. Administration was by a resident commissioner who was under the direction of the British High Commissioner for Ba-

sutoland, etc., who possessed legislative authority which was exercised by proclamation. Resident Commissioner, E. C. Richards (Mar. 20, 1935). See SOUTH AFRICA, UNION OF, under *History*.

BATES COLLEGE. A nonsectarian college for men and women at Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1935 was 644. In the 1935 summer session there were 212 students. The faculty numbered 42. The endowment amounted to \$1,713,189. Total income was \$284,915, of which \$120,612 was from interest on investments, \$160,463 from student fees, and \$3839 from gifts. The library contained 67,525 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

BATTLESHIPS. See NAVAL PROGRESS.

BAVARIA. See GERMANY.

BAY BRIDGE. See BRIDGES.

BEAUX-ARTS INSTITUTE OF DESIGN. A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris and organized in 1916 by the Society of Beaux-Arts Architects. The enrollment during the year 1934-35 consisted of 1450 architectural students, 134 students of sculpture, 115 students of mural painting, and 69 creative design students. Due to a lack of support the Department of Sculpture has been temporarily discontinued beginning with the school year 1935-36. The most important prize is that given by the Society of Beaux-Arts Architects, which amounting to \$3600 affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. There was also a traveling scholarship for sculptors amounting to \$1200, the winner being required to spend three months at the Fontainebleau School of Fine Arts and to travel abroad. The director in 1935 was Whitney Warren, the secretary was Henry R. Sedgwick. Headquarters are at 304 East 44th Street, New York City.

BECHUANALAND (bēch'ōō-a'na-lānd' or bēk'ū-) **PROTECTORATE.** A British territory in South Africa. Area, 275,000 sq. miles; population (1921), 152,983 of whom 1743 were Europeans. The principal villages were Serowe with an estimated population of 25,000, Kanye, 12,000; Molepolole, 9000, Mochuli, 8000; Maun, 5000; and Ramoutsa, 3500.

Production and Trade. Animal husbandry was the main industry. Grain crop production was dependent on the rainfall. Livestock (1934) 1,450,000 cattle; 315,000 goats; 170,000 sheep; 8484 donkeys; and 3064 horses and mules. The output of gold and silver mined during 1933-34 was valued at £22,327. Custom duties were collected by the Union of South Africa and paid into the Union Treasury which paid an annual lump sum to Bechuanaland. For that reason full figures for imports and exports were not available. In 1933, exports of dairy products (by European settlers) totaled £26,889; hides and skins, £4200 (1931); hides and karosses of wild animals, £922. Imports (1933) by traders were valued at £150,896.

Government. The protectorate was administered by a resident commissioner (Lt.-Col. C. F. Rey in 1935) with headquarters at Mafeking, Union of South Africa, under the British High Commissioner for Basutoland, Bechuanaland, and Swaziland (Sir W. Clark in 1935) who had the power to legislate through proclamation. See SOUTH AFRICA, UNION OF, under *History*.

BETTERIES. See ENTOMOLOGY, ECONOMIC.

BELGIAN CONGO. See CONGO, BELGIAN.

BELGIUM. A kingdom of Western Europe. Capital, Brussels. Reigning sovereign in 1935,

Leopold III, who succeeded to the throne Feb. 23, 1934.

Area and Population. Including the cantons of Eupen and Malmédy ceded to Belgium by Germany in the Treaty of Versailles, Belgium has an area of 11,775 square miles. The estimated population on Dec. 31, 1933, was 8,247,950 (8,092,004 at the 1930 census). Living births in 1933 numbered 135,769; deaths, 108,377; marriages, 65,098; emigrants, 16,229; immigrants, 19,325. The chief towns, with their estimated populations on Dec. 31, 1933, are: Brussels, with suburbs, 891,422; Antwerp (Anvers), 289,478; Ghent (Gand), 168,319; Liège (Lüttich), 164,908; Mechlin (Malines), 61,757; Borgerhout, 55,970; Bruges (Brugge), 52,289.

Education. Besides the numerous private and free schools, many of them under clerical control, there were on Dec. 31, 1933, a total of 8587 primary schools, with 973,989 pupils, 4057 infant schools, with 257,747 pupils; and 1135 adult elementary schools, with 30,030 pupils. For secondary and higher education there were in 1932-33, 167 higher grade schools, with 44,048 pupils; 70 preparatory and other schools, with 16,949 pupils; and four universities, the enrollment of which in 1932-33 was: Brussels, 2828; Ghent, 1851; Liège, 2812; and Louvain, 3965.

Production. Highly developed manufacturing, mining, and agriculture enable Belgium to support a population of 700 per square mile, or one of the densest in Europe. About 40 per cent of the area is under cultivation and 18 per cent is covered by forests. Production of the chief crops in 1934, with 1933 figures in parentheses, was (in metric tons): Wheat, 389,800 (410,100); rye, 528,400 (566,700); barley, 105,200 (100,400); oats, 684,200 (830,500); potatoes, 3,178,600 (3,689,300); sugar beets, 1,607,000 (1,515,800); tobacco, 6400 (6200); flax, 20,600 (16,900). Livestock on Jan. 1, 1934, included 1,812,607 cattle, 233,289 horses, and 1,352,526 swine.

Among the wide variety of industrial products, the most important are iron and steel, rayon, glass, automobiles, lace, linen, gloves, refined sugar, distillery products, margarine, and matches. The mineral and metallurgical production in 1934, with 1933 figures in parentheses, was (in 1000 metric tons): Coal, 26,366 (25,278); coke, 4746 (4393); pig iron, 2907 (2745); steel ingots and castings, 2948 (2731); lead (smelter), 65 (61.6); zinc, 174.9 (137.3). Production of electricity in 1934 from plants of over 100 kw. capacity was 4,023,000,000 kwh. (3,902,000,000 in 1933). A census of Dec. 31, 1930, showed 1,938,118 persons engaged in industry, the industries with the largest number of workers being, in the order named, metals, textiles, construction, transport, and mining.

In 1935 raw steel production was 2,965,665 metric tons; finished steel, 2,303,760 tons; pig iron, 3,060,447 tons; coal, 26,484,230 tons.

Foreign Trade. Under the Customs Union agreement of Mar. 5, 1922, foreign trade statistics of Belgium and Luxembourg are combined. Imports of merchandise in 1934 were valued at 13,702,000,000 Belgian francs (14,822,000,000 in 1933) and merchandise exports totaled 13,443,000,000 francs (14,032,000,000 francs in 1933). The principal sources of imports in 1934 were (in millions of francs): France, 2299; Germany, 2002; Netherlands, 1434; United Kingdom, 1042; United States, 1006. Exports, in millions of francs, went mainly to France, 2325; United Kingdom, 1792; Germany, 1599; Netherlands, 1517; United States, 591.

Imports in 1935 were valued at 17,325,005,000 francs (preliminary) and exports at 16,146,219,000 francs. The 28 per cent change in the value of the franc during the year would be the equivalent of a 41 per cent increase in unit values, for purposes of comparison with the 1934 trade figures. U.S. statistics showed imports from Belgium in 1935 of \$39,759,908 (\$26,174,482 in 1934) and exports to Belgium of \$58,207,891 (\$50,005,704 in 1934).

Finance. Budget figures for the calendar years 1933 and 1934, the 1935 results as estimated Oct. 15, 1935, and the 1936 budget estimates, are shown in the accompanying table from *European Financial Notes* (No. 208), published by the U.S. Dept. of Commerce.

BELGIAN BUDGETS, 1933-36

Year	Revenues 1,000 francs	Expenditures 1,000 francs	Deficit (-) or surplus (+) 1,000 francs
1933	10,356,418	10,357,625	- 1,207
1934	9,928,002	10,227,200	- 299,198
1935	9,909,774	10,108,827	- 199,053
1936	10,429,390	10,402,335	+ 27,055

Actual tax collections in 1935 were 8,333,678,037 francs, as compared with 8,207,370,783 francs in 1934.

Communications. Belgium in 1934 had open to traffic about 3201 miles of state-owned but privately operated main railway lines, 3171 miles of provincial railways, 6465 miles of highways, 1050 miles of navigable waterways, and air lines linking Brussels, Ostend, Antwerp, Liège, and Le Zoute. Railway receipts and expenditures in 1934 were 2,215,171,000 francs and 2,261,000,000 francs, respectively. The Belgian merchant marine on June 3, 1935, totaled 402,200 gross tons. During 1934, 16,609 vessels of 26,033,102 net register tons entered Belgian ports with cargo and in ballast in the overseas trade. Of this total, 11,917 ships of 21,202,581 tons entered the port of Antwerp.

Government. The King exercises executive power through a ministry responsible to parliament. There is a Senate of 159 members and a Chamber of Deputies of 187 members, all elected for four years. Deputies are elected directly by universal male and restricted female suffrage. Part of the Senators are elected by direct suffrage and part are chosen indirectly by the provincial councils. The standing of the parties in the Lower Chamber following the election of Nov. 27, 1932, was: Catholics, 79; Socialists, 73; Liberals, 24; Frontists (Flemish Nationalists), 8; Communists, 3. The standing in the Senate after the elections of Dec. 4, 1932, was: Catholics, 75; Socialists, 65; Liberals, 18; Frontists, 1. Premier at the beginning of 1935, George Theunis (Catholic), heading a Catholic-Liberal coalition. For changes in 1935, see *History*.

HISTORY

Gold Standard Abandoned. Belgium's long struggle to maintain the gold standard was lost in the spring of 1935 when the imminent collapse of the banking system, accompanied by the rapid flight of gold from the country, forced the government to abandon its deflationary policy. The Theunis Cabinet, formed Nov. 19, 1934, was the last of the series of Catholic-Liberal coalition ministries which attempted to ride out the economic blizzard by adherence to orthodox economic doctrines. Like its predecessors, it sought to check the steady decline in Belgian foreign trade by ever more drastic cuts in the cost of production, hoping in this manner to reduce prices of Belgian

export commodities to the point where they could once more compete with similar exports from Britain, the United States, and other countries which had devalued their currencies.

During the first months of 1935 the government continued its policy of ruthless deflation by curtailing government expenditures, slashing doles and pensions, cutting wages and prices, lowering tariffs on agricultural imports, and in many other ways reducing business costs. At the same time it reduced taxes and extended large credits to the banks and to industry on liberal terms. Despite these measures, the export trade failed to respond favorably during the first quarter and unemployment increased. Moreover the policy of deflation, carried out primarily in the interests of the banking, industrial and business classes and bearing heavily upon the wage earners, the unemployed, the civil servants, and the farmers, provoked widespread social unrest. Demonstrations of the unemployed, threats of a general strike, and the withdrawal of the Socialists from the National Labor Commission appointed by King Leopold on February 10 to study the unemployment problem, led the government to take some alleviative measures.

The major factor in the subsequent debacle, however, was the unsound position of the private banks. Their reckless extension of credit during the first years of the depression left them unable to meet the withdrawals of their depositors when the credits became frozen and they were forced to draw increasingly upon the gold reserve of the National Bank of Belgium. The highly unstable condition of the Belgian economic and financial structure was aggravated during February and March by a sharp decline in the pound sterling, placing a new price barrier in the way of Belgian exports. In the second week in March the flight of capital from the country and the depletion of the gold reserve suddenly reached panic proportions. Gold withdrawals from the National Bank totaled 77,000,000 francs on March 13, 180,000,000 on March 14, 354,000,000 on March 15, and 280,000,000 francs during the two-hour banking period on Saturday, March 16. The following day the government abandoned the gold standard by issuing decrees placing all foreign exchange operations and dealings in gold under its control.

The same day (March 17) Premier Theunis and several colleagues went post-haste to Paris in a last minute attempt to induce the French to lower their tariff wall against Belgian goods and thus insure an upswing of Belgian exports which might save the situation. Upon Premier Flandin's rejection of this proposal, the Theunis Cabinet resigned on March 19.

Van Zeeland Forms Cabinet. The collapse of the gold standard marked the end of the Catholic-Liberal coalition rule, which had been almost continuous since 1921. After an extended Cabinet crisis, accompanied by general public uncertainty and speculative activity on the Bourse, a new ministry was formed on March 25 by Dr. Paul van Zeeland. Dr. van Zeeland was vice governor of the National Bank and director of the Institute of Economic Science at Louvain University. His cabinet, representing a coalition of the three major parties, contained six Catholics, five Socialists, and four Liberals. The Socialists were forced to cooperate with their old bourgeois rivals by the strong possibility that the breakdown of parliamentary government at that juncture would result in a Fascist dictatorship.

Dr. van Zeeland presented his programme to

Parliament on March 29. Boldly departing from the orthodox economic policies of his predecessors, he proposed the establishment of a "managed economy" modeled in some respects on the American New Deal. Devaluation of the belga was the major point in his plan for the economic renovation of the country. Supplementary proposals were the establishment of an exchange-stabilization fund from the profit of devaluation, reorganization of the banking system, control of stock-exchange operations, the guaranty of bank deposits, creation of a public-works programme for the relief of the unemployed, conversion of Government bonds to reduce the burden of the public debt, and lowering of interest rates and taxes to lighten the burdens of industry.

Suspension of the gold standard and a 30 per cent maximum devaluation of the belga was approved by the Chamber of Deputies on March 30, by a vote of 107 to 53, and in the Senate by a majority of 110 to 20. The remainder of the Premier's plan was approved in principle and he was granted authority to govern by decree for one year, while putting it into effect. Devaluation of the belga by 28 per cent was decreed the following day. On April 1, also, other decrees were published putting into effect other points in the rehabilitation programme. The same day the Bourse reopened, after a five-day suspension. The first reactions to these developments were favorable. Wholesale prices rose, business spurred ahead, security values increased, and considerable reemployment took place. Conservative fears of immediate uncontrolled inflation were dispelled. The rapid improvement in the monetary situation permitted the Central Exchange Bureau to relax its control and on Apr. 28, 1935, it announced its decision to return to essentially the same conditions as those prevailing prior to March 18. Importers were able to buy foreign exchange freely to meet all their obligations.

The government used the profits of the devaluation of the belga to finance its recovery programme and to reduce its debt to the National Bank from 1,370,000,000 francs (the belga equals five francs) to 500,000,000 francs. Government securities were converted at a lower interest rate, the new average being 4 per cent. Conversion operations saved the Treasury about 620,000,000 francs annually. From the profits on revaluation of the gold reserve a fund of 1,000,000,000 francs was established to support the market for state bonds. By the decree of April 19 a Bureau for Economic Revival was established to execute, coordinate, and supervise the government's recovery measures. This agency, reflecting the authoritarian tendencies of the younger members of the Cabinet, was rendered ineffectual from the beginning by the opposition of the more conservative supporters of constitutional methods. The decrees of April 11 and 13 suspended the gold clause in domestic contracts covering leases and loans and those fixing interest. A decree of June 13 provided for the establishment of the Rediscount and Guaranty Institute as an adjunct of the National Bank, for the purpose of mobilizing banking assets and meeting special credit requirements. More rigid control of Belgian deposit banks was established by the decree of July 10.

The slow but steady economic improvement recorded under the van Zeeland rehabilitation programme led the Premier to declare on July 21 that the country was definitely on the road to recovery. When in August this recovery seemed to be slackening, the Minister of Public Works announced

that the government would spend 3,500,000,000 francs on a three-year public works programme to stimulate reemployment. The most threatening adverse factor in the situation was the failure of exports to expand in proportion to domestic business activity. The retail prices of ordinary foodstuffs also were out of line, having risen much higher than the 8 per cent increase in the retail price index recorded from April to September. At the end of August, the government raised salaries and pensions 5 per cent to compensate for increases in the cost of living.

By the end of the year the success of the devaluation experiment was reflected in practically all business indices. There was a minor boom in the building trade and in railway traffic. Port traffic showed a similar increase and bankruptcies showed an extraordinary decline. Tax returns rose substantially and there was a definite recovery in foreign trade.

In the midst of its recovery effort, the nation was shocked and grieved by the death of Queen Astrid (q.v.) in an automobile accident near Lucerne, Switzerland, on August 29. King Leopold, who was driving the automobile, was slightly injured. A world's fair, opened at Brussels on April 27, attracted numerous tourists to Belgium during the summer and aided appreciably the economic revival.

Foreign Relations. The van Zeeland Government strove to promote economic recovery by its foreign policy as well as by internal economic adjustments. Following the signing of a reciprocal trade agreement with the United States on February 27, negotiations for similar agreements with Australia, the Soviet Union, and various other countries were opened, but without marked success. A new clearing agreement with Germany went into effect August 1. It was expected to stimulate Belgian exports to Germany and permit the settlement of back debts. The political relations between Belgium and Germany remained cool, however, partly as a result of widespread Nazi propaganda for the reincorporation in the Third Reich of the enclaves of Eupen and Malmédy, ceded to Belgium by plebiscite after the World War. Belgian police arrested a number of Nazi agitators in the districts. Belgium joined in the application of League economic sanctions against Italy in connection with the Italian invasion of Ethiopia (q.v.). See *GERMANY under History*.

Consult Henri Laurent, "Belgium Under a New Leader," *Current History*, August, 1935.

BEREA COLLEGE. A nonsectarian, coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1935 was 1723, distributed as follows: College, 699; academy, 584; foundation-junior high school, 399; nurses, 41. The enrollment in the summer session of 1935 was 327. The faculty numbered 109. The endowment amounted to \$9,634,364.99, and the income for the year ending June 15, 1935, was \$524,965.79. The library contained about 71,000 volumes. President, William J. Hutchins, D.D., LL.D.

BERG, ALBAN. An Austrian modernist composer, died in Vienna, Dec. 24, 1935, where he was born, Feb. 9, 1885. While working as a clerk, he studied composition under Arnold Schonberg (1904-08), from whom he absorbed his revolutionary ideas. His first composition was a setting of a poem by Theodor Storm in 1900, *Schliesse mir die Augen beide*, to which he composed an-

other setting in 1925. In 1908, he composed a one-movement piano sonata in B minor which he designated as *Opus 1*. During this same period he also wrote "Four Songs," which were preceded by "Seven Early Songs"; a second group, "Five Orchestral Poems After the Texts by Peter Altenberg," and "Four Pieces" for clarinet and piano, both dedicated to Schönberg. "Three Orchestral Pieces" appeared in 1914 and was followed by "Chamber Concerto" for piano, violin, and 13 wind instruments, and a *Lyric Suite* (1926), in which 12-tones were used in large measure. In 1929 appeared his concert aria, *Wine*.

Berg's chief work, which was also considered the most important opera of the post-war decade, was *Wozzeck*. It was first performed at the Berlin Opera in 1925, under the direction of Erich Kleiber—a performance known for its artistic perfection—and later produced throughout Europe, and, in America, by the Philadelphia Grand Opera Company, under the direction of Stokowski, on Mar. 19, 1931. On Nov. 24, 1931, it was brought by the Philadelphia Opera Company for a single performance to the Metropolitan Opera House in New York. This opera was first begun in 1914 but its completion was interrupted by the World War and was not accomplished until 1922. The story is based on a play of the same name by Georg Buchner. Of this opera, Lawrence Gilman, music critic of the *New York Herald-Tribune*, said that after Debussy's "Pelléas and Mélisande," it was "the most original and seizing thing in the lyrico-dramatic art of the last half-century."

His latest operatic work was *Lulu*, based on two dramas of Frank Wedekind, upon which he was working at the time of his death. This was never performed as a stage work, but the world première of five fragments of it was given at the Berlin Staatsoper on Dec. 1, 1934. These were first presented in America by the Boston Symphony under Serge Koussevitzky in March, 1935, and in New York in April, and in November were again given in New York by the Philadelphia Orchestra under the direction of Otto Klemperer. Critical opinion was divided as to the merit of this last work.

In 1925, Mr. Berg was elected a director of the Austrian Branch of the International Society for Contemporary Music, and from 1930 was a member of the Prussian Academy of Fine Arts.

BERMUDA. A British colony in the Atlantic 580 miles east of Cape Hatteras, comprising 360 small islands (20 inhabited). Area, 19.3 sq miles; population (1933 est.), 21,116. Hamilton, the capital, had 3259 inhabitants. Bermuda was the headquarters for the West Indies and Atlantic Squadron of the British Navy.

Production and Trade. Onions, potatoes, green vegetables, cut flowers, and lily bulbs were the chief products. Bananas, and arrowroot were other products. The value of agricultural production during 1934 was estimated at £201,500. Vegetables exported during 1934 totaled 142,194 bu.; lily bulbs, 2309 cases—the U.S.A. and Canada were the main markets. Total imports during 1934 were valued at £1,340,727; total exports, £294,762. The new channel at the entrance to St. George's Harbor was officially opened during May, 1935.

Government. For 1934, revenue amounted to £363,473; expenditure, £372,065; public debt, £112,756. Budget estimates (1935): revenue, £388,134; expenditure, £394,390; (1936): revenue, £378,356; expenditure, £364,595. The colony was administered by a governor (who also was the commander-in-chief of the military forces) assisted by an ex-

ecutive council of 9 and a legislative council of 9 (both appointed by the King), and a representative assembly of 30 members. Gov. Sir T. A. Cubitt was to be succeeded by Lieut.-Gen. R. J. T. Hildyard during April, 1936.

History. Construction was started in November, 1935, on the new air base which was estimated to cost £47,000 of which £28,000 was a grant from the Colonial Development Fund.

BERNSTEIN, HERMAN. An American journalist, died at Sheffield, Mass., Aug. 31, 1935. Born in Neustadt-Scherwindt, Russia, Sept. 21, 1876, he came to the United States in 1893. Following the completion of his education, he turned to journalism, and from 1900 contributed frequently to the *New York Evening Post*, *The Nation*, and to *Ainslee's Magazine*. From 1908 to 1912 and again in 1915 he served as special correspondent in Europe for the *New York Times*, and interviewed many celebrities, including Henri Bergson, Auguste Rodin, Georges Brandes, Kerensky, Bernard Shaw, and Schnitzler, and published his interviews in *With Master Minds* (1912). In 1914, he founded a Jewish daily called *The Day* in New York, and was its editor for two years. From 1915 to 1919 he filled the chief editor's chair of *The American Hebrew* and was also its publisher. From 1923 to 1928, he served as editor of *The Jewish Tribune*.

Mr. Bernstein made a special study of the condition of the Jewish people in the stricken countries of Europe during 1915 and 1916, and in 1917 the *New York Herald* sent him to Russia to describe the revolution. Through access to official archives, he obtained the telegraphic correspondence between Czar Nicholas and Kaiser Wilhelm during 1904-07, that was published in the *Herald*, and in 1918 issued in book form as *The Willy-Nicky Correspondence*. In 1919, still serving as special correspondent of the *Herald*, he was sent to Japan and Siberia with the American Expeditionary Forces, and in 1920 to the Paris Peace Conference. For the *New York American*, during the year 1920-21, he wrote a series of articles describing the new European nations created through the Treaty of Versailles.

In February, 1930, President Hoover appointed him United States Minister to Albania, and during his incumbency he negotiated the naturalization treaty between the two countries that was signed Jan. 21, 1931, and the extradition treaty, signed Mar. 1, 1932. He resigned in September, 1933, and became editor of *The Jewish Daily Bulletin*, but retired in 1934 to devote his time to literary work.

Mr. Bernstein was an ardent champion of his race and agitated at all times for the improvement of conditions among the Jews. In 1921 he wrote an exposé of the *Protocols of Zion* in *The History of a Lie*. He sued Henry Ford for libel as a result of a series of anti-Semitic articles that appeared in *The Dearborn Independent*, and in 1927 received a personal apology and a general retraction of the articles.

Besides his contributions to newspapers and magazines, he published a number of books, among which were: *The Flight of Time* (poems) (1899); *Contrite Hearts* (1905); *Celebrities of Our Time* (1925); *The Road to Peace* (1926); and *Herbert Hoover, The Man Who Brought America to the World* (1928); translated the works of Tolstoy, Gorki, and Andréev; and adapted the plays, *The Command to Love*, *Katerina*, *The Chief Thing*, and *Anathema*.

BESSARABIA, bēs'a-rā'bī-a. A territory joined to Rumania on Apr. 11, 1918, formerly a province of Russia. Area, 17,146 sq. miles; population, 3,001,472 (1934 estimate). See *RUMANIA* under *History*.

BIBLE SOCIETY, AMERICAN. Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment" and without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without profit and below cost or donated free when circumstances justify. During the 119 years of its existence, the society has issued 261,365,086 volumes and participated in the translation, publication, and distribution of the Scriptures in nearly 300 languages, dialects, and versions.

The work in the United States is carried on through 11 home agencies and some 100 auxiliary, State, and local Bible societies. Latin America and the Near East and Far East are covered by 12 additional agencies, while correspondents help carry on the work in other countries, especially in Europe and Africa. During 1934 the society issued 7,517,548 volumes in 176 languages. The number issued in the United States was 3,404,334, and in foreign lands, 4,113,214. Engaged in this distribution were 3309 agency secretaries, sub-agents, colporteurs, correspondents, and volunteers.

During 1934 a revision of the *Psalms* in Hinghua Colloquial Chinese and a translation of the New Testament for the Cheyenne Indians of Montana were published. Translation was in progress in Guatemala for the Man and Quiche Indians, in the Philippines on the Samareno Old Testament; revisions were advancing in Cebuan and Ibanag. Several other revisions and translations were under way or being studied in languages of widely scattered parts of the earth.

The budget of the society for 1934 was \$986,100. The officers were John T. Manson, president, the Rev. Eric M. North, D.D., and the Rev. George William Brown, D.D., general secretaries; the Rev. Lewis B. Chamberlain, D.D., recording secretary; Gilbert Darlington, treasurer, and Charles W. Fowle, assistant secretary. Headquarters of the society are in the Bible House, New York City.

BICKNELL, ERNEST PERCY. An American Red Cross official, died at Washington, Sept. 29, 1935. Born near Vincennes, Ind., Feb. 23, 1862, he graduated from the University of Indiana in 1887, and turned to newspaper work, serving as a reporter in Indianapolis until 1893. Later he was co-owner, with his brother, of the *Fort Wayne News-Sentinel*. Secretary of the Indiana State Board of Charities in 1893, he became director of the Chicago Board of Charities in 1898 and served till 1908. His first connection with the American Red Cross developed through his directorship of relief during the San Francisco earthquake and fire of Apr. 18, 1906, when he had charge of distributing among the sufferers a fund of \$650,000 raised in Illinois. Following the successful completion of his task he was asked to join the Red Cross, but refused. In 1907 he was persuaded to attend the International Red Cross Conference in London as a delegate, and the following year, Robert W. de Forest, and others interested in the Red Cross, offered him the position of director-general with his salary assured for five years by the Russell Sage Foundation. He accepted in October, 1908, and his long association with the Society was begun.

Mr. Bicknell's first practical experience as director was at Messina and Calabria, Italy, where he was in charge after the earthquake of December, 1908. At the outbreak of the World War he went to Europe to take charge of giving financial aid to stranded Americans. When he returned he became a member of the War Relief Commission of the Rockefeller Foundation and again went to Europe to study the effect of war upon the civilian population of the belligerent nations, with a view to instituting relief measures. He spent eight months of the year 1914-15 abroad with this Commission, which set up a system of relief for 8000 Belgian refugees in Holland, and initiated the American Sanitary Commission, which did so much in suppressing a typhoid epidemic in Siberia. In 1915 he returned to Washington and became director-general of the civilian relief, which post he held until May, 1917, when he again went abroad as a member of the first American Red Cross Commission to Europe, to supervise the relief work for the American Army and the civilian population of the invaded countries. In the fall of that year he went to Italy to superintend the emergency relief after the rout of the Italian Army at Caporetto. On Jan. 1, 1918, he was appointed Red Cross Commissioner to Belgium with the military rank of lieutenant-colonel, and under his leadership, thousands of lives were saved, and the burden of the Belgian peoples considerably lightened.

At the close of the War, the work of the Red Cross was extended to cover all the countries of Europe and in 1919 Mr. Bicknell was made deputy commissioner. He returned to the United States in 1920 and became acting director for foreign operations. Once more he went to Europe as American Red Cross Commissioner, remaining from 1921 to 1922. He returned to America in that year to resume his work as director of foreign operations, and on Apr. 1, 1923, was elected vice chairman of the Red Cross in charge of foreign operations. In 1929 he went to China as a member of the Red Cross Commission sent to study famine conditions there, and in 1931 was a member of the Nansen Refugee Relief Commission at Geneva. About two years before his death, ill health caused his retirement.

Mr. Bicknell's long and outstanding career in the service of the Red Cross was recognized by many nations who conferred many honors upon him. In 1921 the National Institute of Social Science awarded him its gold medal. He represented the United States at many international congresses of the Red Cross, and in 1908 and 1909 was president of the National Conference of Charities and Corrections. He served as a member of the executive board of the Boy Scouts of America, and as director of the National Association for the Study and Prevention of Tuberculosis. His memoirs, *Pioneering with the Red Cross*, were published posthumously in October, 1935.

BILITON. See NETHERLAND INDIA.

BILLIARDS. Welker Cochran, veteran from San Francisco, and Jimmy Caras, youngster from Wilmington, Del., took the most important billiard laurels of 1935. The former, world's 18.2 balkline champion, won the three-cushion title and the latter captured the world's pocket billiards championship by twice defeating Erwin Rudolph, once in a match which precipitated a tie for first place and again in the play-off. Willie Hoppe, the veteran New Yorker, retained the 18.1 title but failed to gain the long-sought three-cushion champion-

ship, bowing to Cochran in the final game of the tournament in Chicago. Hoppe finished second, beating Arthur Thurnblad for the place. The defending champion, Johnny Layton, didn't finish within the first three. Andrew Ponzi, the 1934 pocket billiards ruler, didn't defend his title in the tournament won by Caras in New York late in the year. Caras's victory was achieved by play well beyond his 25 years, but the high spot of the tournament was in Bennie Allen's run of 125, beating Joe Procita, 125-0.

Edward Lee of the New York Athletic Club, won his fifth consecutive national amateur three-cushion title, defeating Joe Deardorff of St. Louis, 50 to 33 in the 61 innings play-off. Howard Shoemaker captured the amateur pocket billiards crown and Edmund Soussa, the Egyptian, took the national amateur 18.2 title. Miss Ruth Harvey of Santa Monica, Calif. won the women's amateur championship.

Billiards, dormant to a great extent in 1934, blossomed in 1935 when the manufacturers of equipment changed the color of the table cloth to mauve from the age-old green and decorated the pocket trimmings with yellow. The balls were made solid-color and the table, chromium plated and streamlined, looked more and more like a piece of drawing room furniture than the implement of destruction to small boys it had been deemed in earlier days.

BIOLOGICAL CHEMISTRY. The impression gained by a survey of biological chemistry and related branches during 1935 is that it was in general a year of development rather than fundamental discovery, although a number of things were reported which were basically new.

Some interesting researches were concerned with determining the effect of deuterium and deuterium oxide (heavy hydrogen and heavy water) on biological material and biological processes. Contrary to earlier expectations, heavy water has not shown either highly stimulating or toxic properties in its effect on plants. Drs. Brun and Tronstad germinated peas in it up to concentrations of 40 per cent D₂O and found no stimulative effects. Drs. Curry, Pratt, and Trelease reported no effect of dilute heavy water (0.46 per cent) on the growth of *Aspergillus* or on the growth of wheat roots. Algal cells in contact with 97 per cent D₂O for 15 hours were not permanently injured. In 99.9 per cent D₂O, however, the rate of photosynthesis was reduced to 0.4 that in ordinary water. Dr. Barborn found that subcutaneous injection of 1 cc. 99 per cent D₂O in a white mouse depressed metabolism to one-half normal in the succeeding 9-12 hours. Larger and repeated doses caused greater depression lasting eight days.

In another type of experiment it was found that certain enzymes such as *Lactobacillus acidophilus* could cause ordinary hydrogen to change places with the heavy hydrogen in heavy water. It is thought that this reaction is not related to the life processes of the organism but resembles similar changes catalyzed by metals. Drs. Schoenheimer and Rittenberg have put deuterium to a very interesting use in biological research: they fed mice on a diet of fats containing deuterium combined chemically. This served to distinguish these food fats from the fats already present in the bodies of the mice, and consequently the course of these fats and their final fate could be determined. While the technique of this use of deuterium as an indicator does not seem to have been perfected, one set

of experiments with mice showed that fat taken as food is not directly consumed by the organism but is first deposited in the fat tissues. Although of quite a different type another indicator for biological processes might be mentioned here. Drs. O. Chienitz and G. Hevesy of Copenhagen fed phosphorus compounds, made radioactive by bombardment with neutrons, to rats and traced the course of the material and its duration in the body by means of instruments capable of detecting small amounts of radioactivity. They found that the average length of time which a phosphorus atom spends in the body is two months. Also by this means the conclusion was reached that the formation of bones in the animal body is a dynamic process involving continuous loss and replacement.

During the year there was great activity among the workers on vitamins, hormones, and related substances. Dr. Evans and co-workers reported an improved method for getting vitamin E from wheat germ oil. He succeeded in obtaining it in crystalline form. It is a complex alcohol. Drs. Ither, Orent, and McCollum described a new process for isolating vitamin B from brewer's yeast. Dr. Banerjee determined the quantity of ascorbic acid (vitamin C) in coconuts, Palmyra palms, and pineapple juice. He found the juice or milk of the coconut to be a very rich source of the vitamin. Dr. B. Ahmad of India estimated the relative amounts of vitamin C in unboiled and boiled vegetables. He found it to be higher in the latter and thinks that it is formed in the boiling process by the decomposition of an ester-like compound. A German physiologist found that vitamin D, the antirachitic vitamin, occurs in quite large amounts in mushrooms.

Some interesting and important work had to do with the effects of vitamins, hormones, and related substances on plants and animals. Laszlo of Hungary found that vitamin C in concentrations of 1 to 5 parts per 10,000 accelerated and increased the growth of shoots of germinating wheat. Synove Hansen experimented with sterile plant cultures and vitamin C and found that addition of the latter substance in small amounts caused an increase in weight of the plants of 35-75 per cent over that in the controls. The greatest differences were noted when the plants were in the flowering stage. Geoffrey, Bourne, and Allen applied the reagent acetic acid-silver nitrate, which gives a black stain with vitamin C, to certain protozoa, bacteria, molds, lichens, and algae. In all cases they obtained characteristic black granules and they suggest that vitamin C is essential to the existence of living protoplasm probably as an integral part of an oxidation reduction system. Glick and Biskind studied quantitatively the distribution of vitamin C in beef adrenal, where it occurs in the highest concentration in the body, by means of a specific reagent called 2, 6 dichlorophenol indophenol. A possible therapeutic use for vitamin C was announced by Drs. Jungblat and Zwerner of Columbia Medical Center and Drs. King and Mentow of the University of Pittsburgh. They found that the vitamin antagonized diphtheria toxins. Dr. Wright of Columbia found that this same vitamin is useful in cases of high blood pressure in that it reinforces the capillaries. A new synthesis was announced for vitamin C by which it can be produced in large quantities. The synthesis requires American corn or a similar grain as a starting material. From the corn, dextrose is produced which is converted into sorbitol, a polyhydric alcohol. Sorbitol by suitable chemical treatment

yields the vitamin. The best known property of vitamin C is its power to prevent scurvy.

Dr. George Wald of Harvard, using as material the eye of the frog, found that vitamin A was involved in the chemistry of vision. The visual purple coating the rods on the retina is changed by light to visual yellow. The latter is transformed to a white substance called retinene and that in turn becomes vitamin A. To complete the cycle the body builds visual purple, in a manner as yet unknown, from the vitamin. It has been thought for a long time that lack of vitamin A resulted in blindness. Dr. Hale also, experimenting with pigs, came to the conclusion that there is a relation between vitamin A and normal eye development and that defective eyes may often be the result of deficiency of vitamin A in the mother and in the ration. Ester M. Tress states that vitamin A added to the diets of school children tended to increase resistance to the common cold. Dr. E. H. Hughes of the University of California found that the reproduction of pigs was increased when fed on a ration high in vitamin A. It was stated by others that the fruitfulness of plants was not improved by the vitamin. Dr. C. C. Higgins reported a possible use for vitamin A as a therapeutic agent. He found that, mixed with an acid producing diet, it helped to dissolve kidney stones.

Dr. Robert R. Williams of Bell Telephone Laboratories determined the chemical structure of vitamin B. The material used for the structure work was obtained from rice polishings. The molecule contains in its make-up a double nucleus, one pyrimidine and one thiazole. Dr. Williams' work clears the way for a synthesis of the compound. A deficiency of this vitamin in food is responsible for the nerve disease, beri-beri. Prof. George Cowgill in his book *The Vitamin B Requirement of Man*, Yale University Press, discusses methods of determining the requirement, and the clinical conditions associated with a lack of the vitamin. He suggests its possible importance in cases of enlarged heart, bradycardia, and diseases of the digestive tract.

Although a number of investigators believe and have reported that vitamin D, the antirachitic vitamin, may exist in more than one variety, Dr. Ottar Rygh of Oslo fed the vitamin obtained from many sources to chickens and could detect no variation in the effects produced by different samples. Dr. C. I. Reed reported that vitamin D was an effective pain reducing agent in cases of arthritis.

H. Blumberg found that material contained in wheat germ oil is necessary not only for reproduction and late growth stimulation, but also for normal early growth, middle growth, and the maintenance of well-being. The effective substance here is either vitamin E or some other yet unrecognized fat soluble growth factor occurring in the oil. Vitamin E, according to Dr. J. R. Davidson of Winnipeg, Canada, increases the resistance to cancer in mice which have been treated with cancer producing agents.

A new food factor necessary for the growth of chickens was discovered by Dr. W. Dam of Copenhagen, and named vitamin K. Another new substance, announced by Dr. W. J. V. Osterhout of the Rockefeller Institute, was found in the protoplasm of unicellular animals and controls in some way the irritability of the cell. The substance is called simply "R." Dr. W. C. Rose and associates at the University of Illinois succeeded in identifying and preparing alpha amino beta hydroxybutyric acid. This compound is unique in that it is said to

be the one amino acid essential for life and growth.

Martin and Gardner performed interesting experiments with glutathione, cystine and cysteine, sulphur compounds which occur in proteins particularly in the hair and nails. These compounds were fed to rats hairless from birth. Glutathione had no apparent effect but cystine, fed at the rate of 5 milligrams per day, grew hair in a month while cysteine in equal amounts produced the same result in two weeks. The conclusion is that the sulphhydryl group, present in cysteine and potentially present in cystine, acts as a powerful stimulant to the hair follicle. Dr. C. W. Best, co-discoverer of insulin, with associates reported that choline, a nitrogen containing compound secreted by the pancreas, was found to be necessary to the functioning of the liver and an important factor controlling the sugar metabolism. It has therefore a possible value in the treatment of diabetes. A new hormone called enterogastrone produced by the upper intestinal walls was announced by Dr. A. C. Ivy of Northwestern Medical School. It is thought that this substance, since it inhibits stomach activity, may prove to be useful in the treatment of stomach ulcers.

The work of Dr. W. M. Stanley of the Rockefeller Institute on the virus which causes tobacco mosaic disease was hailed as an important contribution to our knowledge of virus diseases. Dr. Stanley succeeded in isolating the tobacco virus in considerable quantity and found it to be a crystalline protein like material. This may introduce a new class of disease producing substances and it indicates the possibility that viruses in general may not be living organisms.

The plant hormone, auxin, a substance stimulating growth, was produced synthetically by Drs. Thiamann and Koepfli of California Institute of Technology. Panthogenic acid, believed to be a universal essential of the growth and respiration of cells, was isolated by Dr. R. J. Williams of Oregon State College. Drs. N. K. Schaffer and M. Lee found that the growth hormone from the anterior pituitary is a specific stimulant of protein anabolism. Dr. Leon Velluz at the Paris Academy of Sciences stated that lithocholic acid was the most energetic agent known for the neutralization of the toxin of diphtheria.

The attack on the cancer problem by biochemists and workers in related fields continued vigorously throughout the year. Prof. J. W. Cook of the Cancer Hospital in London said in effect, during a lecture to the Bedson Club of Armstrong College, that certain types of skin cancer were prevalent among workers in coal tar, shale oil industries, and among mule spinners in cotton mills. The carcinogenic agents were found to be certain highly fluorescent constituents of tar, shale and lubricating oils which belonged to the benzanthrene group of hydrocarbons. Many of these compounds were synthesized and found to produce cancer in mice. Drs. Morton, Clapp and Branch reported that malignant growths were caused in 12 out of 60 mice by symmetrical triphenyl benzene and in 8 out of 25 by tetraphenyl methane. Another powerful carcinogenic compound, methylcholanthrene, was prepared by Dr. Fieser at Harvard. The explanation for the appearance of cancer in people not exposed to these chemical compounds has been made along two lines. Professor Cook also announced in his talk that cholic and deoxycholic acids which occur normally among the bile acids of man have recently been converted in the laboratory to a hydrocarbon of the benzanthrene type,

the methylcholanthrene already mentioned. Changes which might produce this compound are known to occur in the body and it may be, therefore, that cancer is due to abnormal decomposition of the bile acids. The other explanation, still in the tentative hypothesis stage, is that there is some relation between cancer and the sex hormones. Drs. Collip, Selye and Thompson at McGill have found that the female sex hormone produces tissue changes similar to the beginning stages of cancer. Also Drs. C. F. Geschickter and Dean Lewis announced during the year that they had found sex hormones in connective tissue tumors.

On the curative side of the cancer problem it has already been mentioned that vitamin E, the fertility vitamin, increases the resistance to cancer in mice. It has been found at the Pasteur Institute, Paris, that the injection of cancer cells into the skin of mice confers immunity to cancer. Along this same line Dr. A. Haddow of Edinburgh University tested the effect of carcinogenic substances on rats in which cancer had already been induced. He found that these compounds inhibited the growth of the tumors. He remarks in his report that the paradox here is only apparent and that x-rays also have the double action of inducing tumor and controlling the growth of tumor already established.

Since 1930 when the female sex hormone was isolated, there has been great interest in the chemistry of sex hormones in general. A male hormone, androsterone, was obtained in crystalline form from male urine by Drs. Butenandt and Tscherning in 1934. This substance plays an important part in the control of the secondary sexual characteristics of the male. Its activity is measured by its effect on the comb growth in castrated cocks. Recently, Dr. Butenandt announced the synthesis of a new compound related to androsterone which is several times more active physiologically than androsterone itself. It was made from androsterone by the reduction of the ketone group in that compound and named androstenediol. Drs. Gallagher and Koch expressed the view that the male sex hormone occurring in the testis is different from androsterone which was obtained only from the urine. That view was substantiated this year by Dr. Laqueur and his associates when they announced the isolation of the testicular hormone in crystalline form. This principle which has been given the name testosterone is several times more potent than androsterone. At the meeting of the American Chemical Society in San Francisco in August, Dr. Ruzicka described the artificial preparation of testosterone from cholesterol.

Drs. A. Butenandt and K. H. Slotta reported that they had obtained from soy beans a substance which has the power to overcome the causes of sterility in some cases. It is called progestin and has the property of stimulating the corpus luteum and preparing the female for a cycle of reproduction. Dr. Lower of the Cleveland Clinic announced the discovery of inhibitin, the counter-hormone of androsterone. He has found it useful in reducing enlarged prostate gland due to senility.

Dr. H. Jensen of the Johns Hopkins University School of Medicine points out, in his article in the *Journal of Chemical Education* for December, 1935, the similarity in chemical structure of such diverse substances of biological and medical importance as the bile acids, ergosterol (the precursor of vitamin D), the sex hormones, the cancer producing agents, and certain cardiac stimulants of both plant and animal origin. The chemical structure of all these is similar in that they have a common central

arrangement composed of three 6-carbon rings and one 5-carbon ring. Such a structure is called a sterol nucleus.

In recent years much information concerning the chemistry of the cardiac stimulating plant glucosides, such as digitalis, has come from the laboratories of Drs. W. A. Jacobs, A. Windaus, A. Tschesche, A. Stoll, and their associates. These substances, used in medicine in the treatment of heart ailments, break down on hydrolysis to sugars and a part called aglucone which is the carrier of the physiological activity. This year Drs. Jacobs and R. C. Edlerfield of the Rockefeller Institute, and Dr. A. Tschesche working independently showed that the carbon skeleton in aglucone is identical with that of the sterols. Such information as this may, of course, lead the way to a synthesis of valuable drug bodies. Related to this is the discovery by Drs. K. K. Chen and L. A. Chen that the poisonous secretions of various toads yield compounds which show a physiological behavior like that of the plant aglucones. Other investigators who have contributed to this work are Drs. H. Wieland, G. Hesse, H. Jensen, and E. A. Evans.

Recently, Drs. Henry D. Dakin and Randolph West of Presbyterian Hospital in New York City, have obtained from liver a substance which is highly potent in the treatment of anemia, many times more so than liver itself. So far the actual chemical nature of the substance has not been determined but it appears to be protein like and to consist of more than one chemical compound. An announcement from the Harvard Medical School by Drs. C. H. Fiske, Y. Subbarow, and B. M. Jacobson has a bearing on this problem. These investigators found that the effect of liver depends upon a mixture of three substances, two of which have been obtained in crystalline form. When administered together the three substances have a strong blood regenerating action, separately there is no effect at all. Another type of anemia, so-called nutritional anemia, seems to be helped greatly by vitamin B₁₂. This was reported to the American Society of Biochemists by Drs. J. L. Kyer and F. H. Bethel of Simpson Memorial Institute of Ann Arbor.

Prof. E. C. Dodds, Director of Courtauld Institute of Biochemistry, London and Dr. R. L. Noble reported the results of some experiments which indicate that the pituitary gland may regulate to an extent at least the reticuloendothelial system, the system concerned with the formation and destruction of blood cells. They found that injections of pituitary extract produce at first anemia in animals. The blood appears poor 4 or 5 days after the injection, but about 2 days later there appear new cells of a type which indicate that regeneration of blood is taking place.

Cortin, the hormone like secretion from the outer layer of the adrenal glands, is coming into more and more prominence in the treatment of certain diseases. It has been used with success in Addison's disease, an ailment definitely due to a deficiency of the adrenal glands, glaucoma, often a cause of blindness in the aged, and in progressive myopia. Dr. M. X. Sullivan of Georgetown University reported this year to the American Society of Biological Chemists that cortin is also useful in controlling a children's disease called muscular dystrophy which has to do with defective nutrition. Drs. E. C. Kendall, H. L. Mason, and C. S. Myers of the Mayo Foundation investigated the chemical nature of cortin. As is so often the case with natu-

ral products they found it to be complex, but were able to isolate three substances possibly compounds: one similar to glucose, another like glycerol, and the third a crystalline alcohol.

In the drug and medicament field a number of interesting items were reported during the year. Dr. H. W. Dudley, biochemist of the Medical Research Council of London together with Dr. Chassar Moir, London University gynecologist, isolated ergometrine, the active principle of ergot, a fungus plant once widely used in child birth. Ergometrine produces uterus contractions after eight minutes.

An organic compound, benzedrine, has been suggested as a substitute for ephedrine in the treatment of cataplexy, a state of muscular rigidity produced by sudden emotion or shock. It also gives relief in cases of narcolepsy (sleep attacks) and has been used in hay-fever and asthma. Its sponsors, Dr. M. Prinzmetal of Los Angeles and Dr. W. Bloomberg of Boston, state that it has a profound stimulating effect on the higher centres of the central nervous system.

The use of non-habit forming alkaloids in the treatment of narcotic drug addiction is not new. Compounds which have been used for this purpose are hyoscine, a derivative of belladonna and pilocarpine, gotten from a plant called *jarborandi*. Drs. Theophil Klingman and William H. Everts of Ann Arbor have, however, suggested a new method of treatment with these compounds. Hyoscine is given to the patient first and it produces mild delirium together with a loss of memory for all occurrences during the treatment. The patient is kept in this state for some time, apparently until his system adjusts itself to the loss of the habit forming drug. Then pilocarpine is administered which restores consciousness. This treatment was given to 57 drug addicts and, after three and a half years 31 remained cured, 7 relapsed after 3-10 months. The other 19 could not be located.

Dr. K. K. Chen and associates of the Lilly Laboratories of Indianapolis found a new way to combat cyanide poisoning. Their method is to make successive injections of sodium nitrite and sodium thiosulfate. It is claimed that this antidote is 10 times as successful as methylene blue which has been in use for this purpose for several years. In one case the method was successful even though the person had taken the usually fatal dose of five grams of potassium cyanide.

Colloidal solutions of metals and salts such as gold, silver, silver chloride, and so forth have been used as therapeutic agents for many years. Recently Drs. A. E. Osterberg, J. A. Barga, and B. T. Horton of the Mayo Clinic at Rochester, Minn., found that colloidal solutions of lead phosphate were useful in the treatment of cancer. Apparent cures were effected in 7 out of 85 advanced and supposedly hopeless cases. It is essential in the treatment that enough of the lead phosphate be given to produce obvious lead poisoning. The effects of the latter are neutralized later by the administration of calcium compounds which bring about precipitation of the lead in the bony structures of the body. Along this same line, Prof. E. F. Burton of the University of Toronto reported to the Colloid Symposium at Cornell University that colloidal metallic arsenic injected into the veins had brought about apparent cancer cures. The colloidal solution was prepared by dispersing tiny particles of arsenic in water and adding gelatin to stabilize the solution and prevent the precipitation of the arsenic.

Bibliography. The outstanding book of the year is the *Annual Review of Biochemistry* edited by James M. Luck, Stanford University Press. It states, by J. B. Sumner, that 6 enzymes and 2 zymogens have been isolated in crystalline form, and that enzyme chemistry is becoming more and more identified with protein chemistry. The book contains a review of the sugars by Sir James Irvine, long considered an outstanding authority in that field. Another chapter describes the synthesis and constitution of ascorbic acid (vitamin C). There are also good accounts of the sulphur chemistry of interest in biological processes, of the plant pigments (carotenes), and auxin a plant hormone. This review is written mainly for the benefit of workers in the field and is not a popular account. Another book worthy of note is *New Conceptions in Biochemistry* by N. R. Dhar, Indian Drug House, Allahabad, India. Dr. Dhar is considered by many to be the greatest of the Indian scientists.

Prizes and Awards. The Davey medal of the Royal Society was given to Prof. A. Harden, formerly of the Lister Institute, for fundamental discoveries in the chemistry of alcoholic fermentation. Dr. Williard M. Allen of the University of Rochester was rewarded for his work on progesterin, a female sex hormone, by receiving the \$1000 Eli Lilly and Co. prize to youthful biochemists. Dr. Karl Mason, Vanderbilt University and Dr. S. B. Wolbach, Harvard Medical School shared the \$5000 award of the Mead, Johnson Co. for researches on vitamin A. The annual \$1000 prize of the American Association for the Advancement of Science was awarded to Dr. P. W. Zimmerman and Dr. A. E. Hitchcock of the Boyce Thompson Institute for Plant Research for their paper on "Response of Plants to Synthetic Growth Substances."

BIRDS. See ZOOLOGY.

BIRMINGHAM-SOUTHERN COLLEGE. A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1935 was 805 full-time students, and 395 part-time students, and for the summer session 399. There were 59 faculty members. The endowment amounted to \$696,191, and the income for the year was \$193,639. There were 40,000 volumes in the library. The construction of a \$20,000 addition to the library has provided stack rooms with a capacity of 96,000 volumes. President, Guy Everett Snavelly, Ph.D., LL.D.

BIRO-BIDJAN. A district in the Far Eastern Region of the U.S.S.R. set aside in 1928 for colonization by Jews and made a Jewish Autonomous Territory by the decree of May 7, 1934. Area, 27,000 sq. miles; population, 50,000 (1934 estimate) of whom 10,000 were Jews and the remainder mainly Russians and Koreans.

BIRTH RATES. See FRANCE, GERMANY, GREAT BRITAIN, SPAIN, ITALY, and JAPAN, and the other principal countries under *Area and Population*; VITAL STATISTICS.

BISMARCK ARCHIPELAGO. See NEW GUINEA, TERRITORY OF.

BLACK WIDOW SPIDER. See ENTOMOLOGY, ECONOMIC.

BOBSLEDDING. The Stevens brothers of Lake Placid, N. Y., who were so prominent in the 1932 Olympics, dominated bobsledding in 1935 to a tremendous extent, one or the other of the brothers figuring in three of the four major titles. Curtis P. was driver of the team winning the North

American four-man championship and also drove the sled that took the national four-man title. J. Hubert and F. Paul took the national two-man championship. Hubert and Paul were third in the North American two-man event, which was won by Ivan Brown and A. M. Washbond, representing the Keene Valley A.A. Robert Martin, Hugh A. Varno, and Crawford Merkle were with Curtis Stevens on the four-man sled. Miss Marian Clark of Baltimore and Miss Jean Wyer of Washington topped men rivals in the race down the Mt. Hoevenberg run at Lake Placid for the national A.A.U. junior championship.

BOHEMIA. See CZECHOSLOVAKIA.

BOILERS, STEAM. Despite the existence of many large water power developments and numerous oil engine installations, the latter mostly in smaller units, steam remains the basic medium for stationary power in the United States. Approximately 60 per cent of the electricity produced by utilities and 85 to 90 per cent of that generated in private industrial power plants is produced by steam. However, no reliable and up-to-date statistics are available as to the number and the aggregate capacity of steam boilers in service in this country.

Along with industrial recovery during the past year has come a noticeable increase in the demand for new boilers. These are partly to replace old, less efficient units and partly to meet the need for greater capacity. In many cases new units of several times the capacity are being installed in the space formerly occupied by the old boilers. Higher pressures, higher steam temperatures, larger units, and the inclusion in the steam generating unit of heat recovery equipment, such as economizers and air heaters, are characteristic of the new installations. Aside from general types, little standardization is possible, except for small units, as each installation is tailored to suit the local conditions and the customer's preferences.

In the industrial field, particularly in the process industries, steam pressures of around 400 lb. per sq. in. are now becoming quite general, although higher pressures of 600 to 1400 lb. are also being employed. The largest industrial plant boiler is that now nearing completion at the Rouge Plant of the Ford Motor Company, Detroit. This is guaranteed to deliver 900,000 lb. of steam per hour at 1200 lb. per sq. in. pressure and 925° F. temperature. The unit is of the bent-tube type and will be fired with pulverized coal. None of the later boilers exceed in pressure the 1800 lb. units installed several years ago in the Philip Carey plant at Lockland, Ohio, which still has the distinction of being the highest pressure plant in commercial service in the United States. A few commercial installations abroad and some experimental units in this country exceed this pressure.

While the record for capacity in the field of central station boilers, namely 1,270,000 lb. per hr., is still held by the pulverized-coal-fired, bent-tube boilers at East River Station in New York, some of the new units now under construction or in the proposal stage will closely approach or exceed this capacity and will operate at much higher steam pressure.

These very large units are all fired by pulverized coal but developments in underfeed stokers, such as water cooling and automatic zoned air control should make it possible to increase greatly the output with this type of firing. To date continuous outputs of over 500,000 lb. of steam per hour have been attained with stoker-fired boilers.

The slagging type of furnace is becoming popular for coals of low ash fusing temperature. These slagging furnaces may be either of the intermittent or the continuous tapping type.

Fusion welding (electric) has played a most important part in boiler construction and is now being employed quite generally in the fabrication of boiler drums, in place of riveting, except for relatively low pressures. For very high pressures fusion welded drums of 4 in. plate thickness are now in service and drums of 5 in. thickness are available inasmuch as X-ray equipment of 400,000 volts and capable of 5/4 in. penetration for examining welds, has been installed by some of the boiler manufacturers. Previous to the present high state of development of fusion welding and its acceptance for such work, the drums of very high pressure boilers had to be forged from the solid ingot, which entailed great expense.

While the past few years has seen much progress in boiler feedwater conditioning, new problems are constantly arising and it continues to form the subject of many studies and research.

The problem of combatting carry-over of solids with the steam to the turbine has resulted in the design of several types of steam washers, placed in the boiler drum, in which the steam has to pass through a sheet or spray of clean feedwater. These washers have proven very effective.

Among other problems that are now occupying the attention of both boiler manufacturers and users is the circulation in certain types of boilers at high pressures and high rates of steaming. To this end numerous studies are now being directed.

Sales of stationary power boilers during 1935, as reported to the U.S. Department of Commerce, totaled 1021 boilers of 3,378,966 sq. ft aggregate heating surface (compared with 852 boilers of 2,436,550 sq. ft. heating surface for 1934).

BOLIVIA. A landlocked Andean republic of South America. Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the government.

Area and Population. The territorial limits of the republic are not definitely fixed, due principally to the boundary dispute with Paraguay. Agreements delimiting parts of the frontiers with Argentina and Peru were still unratified in 1935. The area is variously estimated at from 506,000 to 626,517 square miles, the latter estimate including the disputed Chaco territory. The population at the beginning of 1934 was estimated at about 3,000,000, with Indians comprising 57 per cent of the population; whites, 13 per cent; and mestizos, 30 per cent. Estimated populations of the chief cities in 1932 were: La Paz, 150,898; Cochabamba, 49,612; Potosí, 36,348; Sucre, 26,439; Santa Cruz, 31,691. Spanish is the language of the educated classes; the natives speak Quechua and Aymara. Roman Catholicism is the state religion.

Education. While education is nominally free and compulsory, a large percentage of the population is illiterate. Elementary schools in 1933 numbered 2033, with 161,380 pupils. Secondary schools included 29 colleges, 5 religious schools, and 5 private schools, with a total of 4480 pupils. Eighteen institutions offering university training had 141 teachers and 1682 students. The universities exercised autonomous control of their finances and appointments.

Production. Bolivia's prosperity is largely dependent upon the production and export of tin, which normally constitutes about 80 per cent of the value of all exports. Wolfram, silver, copper,

rubber, bismuth, antimony, lead, wool, hides, cacao, quinine bark, and coffee are the other leading export products. The bulk of the population lives on a bare subsistence level by means of primitive agriculture, the main crops being wheat, barley, oats, corn, rice, and potatoes. With average New York prices for tin the highest since 1927 and the tin export quota of Bolivia advanced by the international tin cartel to 20,994 fine tons, the value of tin shipments increased in 1934 to 106,650,353 bolivianos from 55,634,000 bolivianos in 1933. The 1935 tin quota was reduced to 18,596 fine tons. Despite a marked labor shortage caused by conscription for the Chaco War, import restrictions continued to stimulate the development of domestic manufacturing, especially of tinned milk, textiles, flour, and other foodstuffs. The repeal of the state tobacco monopoly early in 1934 led to an increase in tobacco cultivation and manufactures.

Foreign Trade. The value of Bolivian exports in 1934 was 126,994,000 bolivianos (75,744,000 in 1933) and the value of imports was 72,621,000 bolivianos (41,156,000 in 1933). Although the 1934 exports nearly doubled in value, Bolivia's commercial purchasing power in foreign markets was curtailed by the depreciation of the currency, exchange restrictions, and the government's requisitioning for war purposes of a large share of the foreign exchange received from export payments. The quantity and value of the principal mineral exports in 1934 follow, the figures in parentheses representing metric tons and the others bolivianos: Tin, (23,201) 106,650,353; silver, (162.2) 7,797,086; gold coin and gold in ore, 18,744,735; zinc, (9487) 2,613,816; lead, (11,200) 2,225,261; tungsten, (476) 1,746,644; copper, (1622) 868,367; bismuth, (50) 546,482; antimony, (1201) 517,461. Textiles, wheat, flour, sugar, machinery, iron and steel products, and lumber are leading imports. The United States, Great Britain, and Germany in the order named were the chief sources of imports and the principal export markets were Great Britain, United States, and Germany. Imports from the United States in 1935 were valued at \$2,829,214 (\$5,118,274 in 1934) and exports to the United States at \$362,500 (\$151,999 in 1934).

Finance. The ordinary budget estimates for 1935 balanced at 29,353,000 bolivianos. The largest expenditure item was 7,655,000 bolivianos for the service of the internal public debt contracted after 1930. The payment of interest on foreign and internal loans obtained prior to 1930 remained suspended. In addition to the ordinary budget, there was an emergency budget, estimates of which balanced at 5,895,000 bolivianos in 1935, and an unpublished extraordinary budget covering war and national-defense expenditures. A presidential decree of May 2, 1935, authorized a supplementary budget of 6,610,000 bolivianos to meet additional public works expenditures and the service of the floating debt. The various 1935 budgets went into effect without legislative approval.

The public debt on Dec. 31, 1933, was reported at 383,300,000 bolivianos (279,700,000 on Dec. 31, 1932), of which 158,400,000 bolivianos represented the domestic and 224,900,000 the foreign debt. The boliviano, the unit of currency, is normally worth 36.5 cents in United States currency. Due to the depreciation of the boliviano, however, the official exchange rate was around 4.30 bolivianos to the dollar in 1935 while the open market rate was much higher.

Communications. Bolivia in 1935 had about 1384 miles of railway line, 2400 miles of highway

passable throughout the year, and some 12,000 miles of navigable rivers. The Lloyd Aero Boliviano operated a number of air routes under supervision of the War Ministry, the principal one connecting Cochahamba and Santa Cruz. On June 1, 1935, the Pan American-Grace Airways inaugurated a weekly air-mail and passenger service between Tacna, Peru, and La Paz, the 278 mile trip from the coast to the Bolivian capital requiring only one hour and 45 minutes.

Government. The Constitution of 1880, as amended in 1931, vests executive power in a president elected for four years by direct popular vote and ineligible for reelection until eight years after the expiration of his term. The Congress consists of a senate of 16 members (two for each Department) elected for six years and a chamber of 70 members elected for four years, one-half retiring every two years. The cabinet of six men selected by the President is responsible to Congress. President in 1935, Dr. José Luis Tejada Sorzano.

HISTORY

Chaco War Ended. After three years of sanguinary fighting which cost at least 100,000 lives and impoverished both participants, the war between Bolivia and Paraguay for possession of the Chaco Boreal came to an end on June 14, 1935. A military stalemate and the war-weariness of both nations finally terminated a conflict which all the efforts of the American governments and the League of Nations had been unable to halt. While Paraguay had won possession of the greater part of the disputed territory, the military events of the year clearly demonstrated her inability to invade Bolivia proper and force a conclusive peace.

Military Developments. As described in the NEW INTERNATIONAL YEAR BOOK for 1934, the end of that year found the advancing Paraguayan armies battering at the doors of Villa Montes, the Bolivian general headquarters on the western edge of the Chaco. This strategically important town controlled not only a large part of the valuable oil fields of eastern Bolivia, concessioned to the Standard Oil Company, but also the main road connecting the city of Santa Cruz and the Bolivian Oriente region with the outside world via the Argentine railway terminal at Yacuiba. Gen José Félix Estigarribia, the Paraguayan commander-in-chief, hoped to end the war so far as Paraguay was concerned by capturing Villa Montes and converting it into a strongly fortified barrier against another Bolivian military advance into the Chaco. He apparently realized the futility of attempting to lead his war-worn troops onto the high Bolivian plateau in an effort to force Bolivia's unconditional surrender.

During January, 1935, the Paraguayans made substantial progress towards their goal, capturing one after another of the outlying defensive positions surrounding Villa Montes. In February and March, however, the Bolivians stiffened their defense and with the aid of strong reinforcements repulsed repeated Paraguayan attacks. Towards the middle of March the Bolivian troops took the offensive after a year and a half of defensive fighting and drove their wearied opponents back in the Villa Montes sector. Foiled in his drive on the Bolivian headquarters, the brilliant Paraguayan commander repeated the manœuvre which had proved so successful in the campaign of the previous year against Fort Ballivián. Leaving sufficient troops before Villa Montes to hold the enemy in check, he launched one drive against Boyubí, key

to the Standard Oil Company's refinery at Camiri, and another far to the north across the Parapiti River into Santa Cruz Province in Bolivia proper. On April 6 his veterans forced their way across the Parapiti, capturing the town of Amboro, and struck northward along the road towards Santa Cruz, the capital of Santa Cruz Province. Ten days later they stormed and captured Charagua, an important town of some 10,000 population which was considered the last formidable barrier to the Paraguayan advance on Santa Cruz. In ten days Estigarribia's veterans had seized control of both banks of the Parapiti River for 115 miles and of some 3500 square miles of territory in Santa Cruz Province.

At this juncture the Bolivian commander-in-chief, Gen Enrique Peñaranda del Castillo, launched fierce counter-attacks along the 120-mile front from Villa Montes to Charagua. In the most violent and bloody fighting of the war, the Bolivians during the following month drove the Paraguayans back along the entire front. Charagua was recaptured April 23. On May 6 the Paraguayans retreated to the south bank of the Parapiti, leaving their foes in possession of the major portion of the main road from Santa Cruz to Villa Montes. With the fall of Santa Fé, the last Paraguayan position in the Parapiti River sector, on May 16, the Bolivians announced that they had recaptured more than 7700 square miles of territory in the preceding fortnight.

The tenacity which the Paraguayans repeatedly displayed throughout the war was again evidenced by the resumption of their offensive immediately after such severe reverses. During the last week of May, by desperate fighting, they succeeded in regaining and consolidating their hold on a section of the important Villa Montes-Santa Cruz highway. On June 8, after an eight-day battle, the Paraguayans crushed a Bolivian force of some 5000 troops which had launched an offensive against the strategically important Fort Ingavi, in the north central Chaco. Four days later a truce agreement was signed in Buenos Aires between the Bolivian and Paraguayan Foreign Ministers and on June 14 hostilities ceased. Three years of warfare had demonstrated what neutral military experts had foreseen at the outbreak of the conflict—that the poor state of communications in the Chaco made it practically impossible for either country successfully to invade and conquer the other.

The Peace Negotiations. While the tragic struggle drew towards its conclusion, the League of Nations and the neutral American nations continued their ceaseless efforts for peace. Following Paraguay's indirect rejection of the League's peace plan on Dec. 18, 1934, Secretary of State Hull of the United States proposed that the peace negotiations be taken over by a conference of American states. This proposal was blocked by Foreign Minister Carlos Saavedra Lamas of Argentina, who declined to participate unless the League terminated its efforts.

On Jan. 16, 1935, the Chaco advisory committee of the League Assembly, consisting of representatives of Argentina, Chile, Peru, Mexico, Spain, and Czechoslovakia, met to consider the situation. Holding that Paraguay had violated her obligations under the League Covenant by rejecting the League peace formula, the committee unanimously recommended that the arms embargo against Bolivia be terminated while that against Paraguay should be strengthened. Led by Great Britain and

France, 22 countries accepted the committee's recommendation and lifted in favor of Bolivia the arms embargo previously placed in effect against both belligerents. This drastic action, representing the first League effort to impose sanctions in a mild form, proved ineffective in terminating the war, due chiefly to the attitude of Argentina and Uruguay. Uruguay flatly refused to discriminate against Paraguay by prohibiting exports or transshipments of arms and munitions, while Argentina declared herself legally unable to prevent arms shipments to Paraguay via the internationalized Paraná River.

The League's embargo policy, besides failing to terminate the conflict, provoked Paraguay into announcing on February 23 its withdrawal from the League. The following day the three-month period allowed under the Covenant for the acceptance of the League peace plan expired and the League was confronted with the alternatives of either confessing its impotence or imposing stronger sanctions against Paraguay under Article XVI. When the League's Chaco advisory committee met on Mar. 11-15, 1935, to formulate recommendations for League action, the Argentine, Chilean, and Uruguayan representatives vigorously opposed the application of sanctions against Paraguay. With the exception of Ecuador and Venezuela, whose spokesmen urged resort to sanctions, the other Latin-American states took no positive stand.

The Advisory Committee on March 15 convoked a Special League Assembly for May 20 to consider the Chaco question, but as the League was manifestly unable to take positive action against Paraguay without the cooperation of the neighbor states, the Assembly's advisory committee readily granted the request of Argentina and Chile for permission to initiate new peace negotiations. This request was supported by Brazil and Peru. In addition to the ABCP group, the United States and Uruguay joined in the negotiations which resulted in the truce agreement of June 12, 1935. Meanwhile the extraordinary League Assembly of May 20-21 deferred consideration of the Chaco question to September to give the American governments time to carry out the peace negotiations.

Under the truce agreement of June 12, firing was suspended on June 14 and a neutral military commission, headed by Gen. Martinez Pita of Argentina and including representatives of the other mediating governments, proceeded to fix lines of separation between the two armies. With the ratification of the protocol of truce on June 21, a 12-day truce automatically became effective. On July 1 a peace conference of the six mediating governments and the two belligerents opened at Buenos Aires. Its first act was to prolong the truce until such time as the security measures called for in the truce agreement were carried out. These measures included the demobilization of the two armies, to be carried out within 90 days; reduction of the belligerents' military effectives to a maximum of 5000 men each; prohibition of the purchase of excess war material; and a pledge of non-aggression. The protocol also provided that during the truce and its extension, the lines of separation of the armies would be maintained "under the guarantees of the Peace Conference, for which purpose the neutral military commission will exercise vigilance and control over them." Demobilization of the armies began on July 3 under a schedule fixed by the neutral commission which called for completion of this operation by September 28.

The duties of the peace conference were set forth in Article I of the protocol of truce as follows:

To settle the practical questions which may arise in the execution of the measures of security adopted for the cessation of hostilities

To promote the settling of differences between Bolivia and Paraguay by direct agreement between the parties; it being understood that, should the direct negotiations fail, Bolivia and Paraguay assume through this pact the obligation to settle the Chaco dispute by means of juridical arbitration, forthwith designating the Permanent Court of International Justice of The Hague as arbitrator.

The peace conference will terminate the direct negotiations when in its opinion the time shall have arrived to declare the impossibility of reaching thereby a definite solution; in this event, it will proceed to the question of an arbitral compromise to be concluded between the parties, the peace conference being unable to terminate its functions as long as the arbitral compromise is not definitely agreed upon.

To promote, when it is deemed opportune, the agreement between the parties relating to the exchange and repatriation of prisoners, bearing in mind the practices and principles of international law.

Establishment of a system of transit, trade and navigation, having in view the geographical position of the parties.

To promote facilities and agreements of various kinds, designed to encourage the development of the belligerent countries.

The peace conference will form an international commission which will render an opinion on the responsibilities of any order and any kind arising from the war; if the conclusions of this opinion are not accepted by one of the parties, the Permanent Court of International Justice of The Hague will definitively settle the question.

Although the peace conference opened in a hopeful atmosphere, it was soon deadlocked as a result of the uncompromising positions assumed by the Bolivian and Paraguayan delegations on almost every question at issue. The question of the exchange and repatriation of war prisoners proved an insurmountable obstacle. The Bolivian delegation demanded the immediate exchange of all war prisoners as a preliminary to negotiations on other issues. Paraguay in July released 10,000 Bolivian prisoners without waiting for an agreement, but announced that she would hold about 28,000 additional prisoners in camps near Asuncion until a peace settlement had been definitely agreed upon. Bolivia, with only a few thousand Paraguayan prisoners, was in no position to enforce her demand. In the middle of August, however, Bolivia threatened to suspend demobilization unless Paraguay released the Bolivian war prisoners immediately. Unable to make progress in the face of these obstacles, the conference suspended plenary sessions indefinitely on August 17, while informal negotiations were continued. Thereafter Bolivian-Paraguayan recriminations grew increasingly bitter and Paraguay lent powerful support to a scheme for the secession of Santa Cruz and Beni Provinces from Bolivia and the establishment of a new republic.

Meanwhile the eternal party struggles for political power, which had been suspended during the war, broke out with renewed fury in Asuncion and La Paz. Although the terms of both President Ayala of Paraguay and President Tejada Sorzano of Bolivia were due to expire in 1936 and both Constitutions made the Presidents ineligible for reelection, the partisans of both executives were preparing to retain them in office by amending the Constitutions or otherwise. Opposition groups strove equally hard to overturn the existing governments. With all factions striving to gain partisan advantage from developments at the peace conference, the Bolivian and Paraguayan delegations there feared to make the slightest concession for fear such action would expose their governments to further partisan attacks. Moreover, dur-

ing August, most of the Bolivian and Paraguayan representatives returned to their capitals, apparently to mend their political fences at home. The struggles of the Argentine, Brazilian, and Chilean delegates for economic and political advantages in Bolivia and Paraguay added to the difficulty of reaching an agreement.

Resuming its formal meetings on September 20, the peace conference took up once more the problem of establishing an international commission to determine the responsibility for the war. A tentative agreement reached on this issue August 3 was not placed in effect as it was feared that the attempt to fix responsibilities would render an agreement more difficult. On September 28 the conference voted to establish a commission of three, to be headed by a jurist from the United States nominated by the Supreme Court at Washington. Bolivia and Paraguay were each to request another American government to appoint the two other members. These decisions were embodied in a protocol made public in Buenos Aires October 21. The commission of investigation was to start work within 90 days. If its decision was not accepted by the parties within 30 days, the question was to be submitted to the Permanent Court of International Justice at The Hague. At the end of 1935 the commission had not yet been formed.

At the same time the neutral delegates decided to attempt to reach a solution of the basic territorial dispute independent of the Bolivian and Paraguayan delegations, whose interminable disputes had prevented any progress. On October 23 the conference submitted to the belligerent delegations its formal proposals for a definitive settlement. While the peace formula was kept secret by the conference, the terms were gradually revealed from Bolivian and Paraguayan sources. According to these, the formula called for the division of the Chaco Boreal by a line extending from Bahía Negra on the Upper Paraguay River to the Pilcomayo River at its intersection with the 22d parallel. Paraguay was to grant Bolivia a free port at Puerto Casado, midway between Asunción and Bahía Negra, and the use of the narrow-gauge railway which extends some 200 miles westward into the Chaco from Puerto Casado. Roads linking the railway terminus with points in Bolivian territory were to remain open to both Bolivian and Paraguayan traffic. The signing of the peace formula was to be followed by the release of all war prisoners, the renewal of diplomatic relations, ratification of the non-aggression clause of the June 12 pact of truce, and the conclusion of an agreement establishing guarantees for the maintenance of peace for five years.

The conference's peace formula was rejected outright by both parties. Paraguay insisted that the final boundary line should coincide roughly with lines of military occupation as fixed by the neutral military commission following the truce of June 12. Bolivia, demanding a more extensive waterfront on the Paraguay River, held out for a frontier line extending from Fort Olimpo on the Paraguay River at latitude 21° to Fort Linares on the Pilcomayo River (see map in 1934 YEAR BOOK, p. 90).

Meanwhile the neutral military commission had returned from the Chaco on October 7, having carried out its mission of supervising demobilization of the two armies and fixing the lines of separation between them. On the strength of the commission's report, the conference on October 28 adopted a resolution declaring the Chaco War at an end. The following day Argentina announced the termination

of her neutrality measures and authorized the resumption of normal trade across her northern frontiers with Bolivia and Paraguay. The other neighboring nations followed suit soon afterward. During the remainder of the year the peace conference struggled unsuccessfully with the issue of the exchange of war prisoners and no progress was made toward settlement of the territorial question.

See ARGENTINA, CHILE, and BRAZIL *under History*; LEAGUE OF NATIONS.

Internal Developments. The political struggle in La Paz, which broke out with renewed force upon the conclusion of the June 12 truce in the Chaco, revolved about the somewhat anomalous position of President José Luis Tejada Sorzano. Dr. Tejada Sorzano, then Vice President, assumed the Presidency on Nov. 28, 1934, when President Daniel Salamanca was forced to resign. Subsequently the Bolivian Congress declared null the 1934 elections in which Franz Tamayo of the Genuine Republican party had been elected to succeed President Salamanca upon the expiration of the latter's term on Mar. 5, 1935. This enabled Tejada Sorzano, a Liberal, to continue in office after his constitutional term ended.

On Apr. 12, 1935, President Tejada Sorzano reorganized his cabinet so as to include representatives of the Liberal, Socialist, and Nationalist parties, as well as several non-party men. The Genuine Republicans were excluded. After the convocation of the peace conference in Buenos Aires, the President received much public support for his contention that it would weaken Bolivia's position if a new election were held while the conference was in session. The death of ex-President Salamanca (q.v.) on July 17 removed one of the chief opponents of the acting President and on August 2 Congress voted to extend the mandate of both President and Congress to Aug. 16, 1936.

The Socialists, meanwhile, had withdrawn from the Cabinet on July 27, their places being filled by two army officers. By another cabinet reorganization on September 6, the Nationalists were also eliminated and the Liberals, supported by a few independents and military men, remained in full control of the government. In October it was announced that the convening of Congress would be postponed indefinitely, because of the lack of a quorum in the Senate. This left President Tejada Sorzano with practically dictatorial powers, including the authority to legislate by decree. The municipal elections, scheduled for the second Sunday in December, were postponed indefinitely by the decree of Dec. 1, 1935.

Under the decree of June 5, 1935, the Tejada Sorzano régime established strict governmental control over immigration, including the power to bar the return of Bolivian citizens considered undesirable by the government. All aliens entering the country were obliged to obtain permits before Bolivian consuls abroad could visa their passports. This decree was believed related to the spread of radical propaganda among the Indian masses. Unrest had been stirred also by the rapid rise in prices caused by the depreciation of the currency and the restriction of imports of foreign goods. During March, 1935, prices almost doubled. The government's rigid control of transactions in foreign exchange was tightened by the executive decree of Jan. 24, 1935, in order to provide more funds for purchases of war supplies abroad. Due to this and other circumstances, the American Vice Consul at La Paz reported on Feb. 12, 1935, that a total of about \$700,000 was due to American creditors for

collections. In March a Provisions Control Board began to supervise all imports; from time to time it issued lists of articles the importation of which was prohibited. It also sought to prevent profiteering in necessities by fixing prices on certain commodities and by rationing.

It was reported on September 11 that the Bolivian Government had signed a contract with the Hochschild Company for the construction of one of the largest hydro-electric plants in South America, using the waters of Lake Titicaca. The work was to take five years and to cost about \$25,000,000. In October the government formally charged the Standard Oil Company with having exported oil from its wells in Eastern Bolivia to Argentina by a secret pipe line without paying production fees to the La Paz Treasury. The charge was denied by the company and a commission sent to investigate the matter by the Argentine Government reported that no pipe line across the frontier existed.

BOSTON UNIVERSITY. A nonsectarian institution of higher education in Boston, Mass., founded in 1869. The enrollment for the autumn session of 1935 was 8874, distributed as follows: College of liberal arts, 726; college of business administration, 2680; college of practical arts and letters, 562; college of music, 158; Sargent college of physical education, 210; school of theology, 230; school of law, 448; school of medicine, 248; school of education, 1530; school of religious and social work, 107; graduate school, 360. The enrollment for the 1934 summer session was 1294. The faculty numbered 552. The endowment amounted to \$4,447,249. In the libraries of the University there were more than 175,000 volumes. President, Daniel L. Marsh, Ph D, Litt D.

BOTANY. Botanical research during the past year has been mainly devoted, as heretofore, to plant physiology and its allied subject, phytochemistry, to cytogenetics, and to ecology. In the following summary under appropriate headings it is possible to mention only those papers dealing with broader aspects of the subjects, and those of economic or general interest.

Mention should be made of the sixth International Botanical Congress, held at Amsterdam September 2 to 7.

Cytogenetics. Numerous investigators devoted their attention to the chromosome structure in various plants. M. Simonet (*Ann des Sci. Nat* 16: 229. 1934) made an extensive study of the chromosomes in species of *Iris*. Twenty-two haploid numbers have now been recorded for different species of this genus. Charles E. Allen (*Bot. Review* 1: 269-291. 1935) reported on the cytogenetics of bryophytes and Barbara McClintock (*ibid.* 292-325) on the cytogenetics of maize. F. M. East (*Genetics* 20: 403-451. 1935) reviewed the genetic reactions in *Nicotiana*, covering the questions of compatibility, dominance and phenotypic reaction. C. F. Feng (*Bot. Gaz* 96: 485-504. 1935) presented a genetical and cytological study of species hybrids in Asiatic and American cottons. Judging from the results, the possibility of making fertile hybrids between the two types is remote unless the chromosome difference between them is removed in some way

before crossing. A total of 1708 crosses was made. John H. Schaffner (*Bull. Torr. Bot. Club* 62: 387-402. 1935) made experiments on various monocious and dioecious plants which indicate that any sexual condition of an individual is not determined by Mendelian sex genes but by physiological balances produced through the interaction of the general hereditary potentialities of the cell on one hand and the environmental conditions on the other. The sexual condition of the higher sporophytes thus may change from time to time.

Ecology. H. J. Webber (*Am. Journ. Bot.* 22: 344-361. 1935) presented the results of an ecological study of the Florida scrub vegetation. This is an association of semixerice evergreen shrubs and small trees forming a dense tangle. On account of the sparse evergreen character of the foliage and the bareness of the soil, especially on the margins between the scrub and high pine land, the fire hazard is much reduced. G. E. Nichols (*Ecology* 16: 403-422. 1935) discussed the hemlock-white-pine-northern hardwood region of eastern North America. The three forest regions recognized in this paper coincide in general in their geographical limits with the three temperature provinces recognized by Thorntwaite in 1931 (*Geog. Rev.* 21: 633-655). In connection with the same topic Stanley W. Bromley (*Ecol. Monog.* 5: 61-89. 1935) discussed in detail the forest types of southern New England. Hardy L. Shirley (*Bot. Review* 1: 355-381. 1935) gave a comprehensive account of light and its measurement as an ecological factor. John Phillips (*Journ. Ecol.* 23: 210-246. 1935) analyzed the concepts regarding the climax, or state of dynamic equilibrium, as applied in ecology. He concluded that the only true climax is the climatic one, and that edaphic, biotic and other so-called climax are capable of explanation on this basis.

Morphology. G. E. Smith (*Ann. Bot.* 49: 451-477. 1935) furnished evidence for the existence in many leaves of marked correlation between the direction of the long axes of the stomata and that of the underlying vascular tissue. He suggested that there is often a correlation between stomatal orientation and vein direction. Robert E. Woodson Jr. (*Ann. Missouri Bot. Gard.* 22: 1-48. 1935) presented a study of the inflorescence of the Apocynaceae, and concluded that the dichasial cyme appears to be the primitive inflorescence of the family.

Under this head may also be mentioned the studies in regeneration by Carl D. La Rue (*Am. Journ. Bot.* 22: 486-492. 1935). He found that excised roots of monocotyledons were incapable of regeneration; that seeds of corn, wheat and barley split lengthwise produced roots and shoots, and that embryos of wheat and sorghum, deprived of endosperm, grew into weak, but normal plants. Wheat seedlings from which shoots were removed produced new shoots, but excised shoots of wheat died, while excised shoots of corn, oats, sorghum, etc., developed adventitious roots. Mutilated seedlings showed no capacity for regeneration.

Pathology. Ernest L. Spencer (*Phytopathology* 25: 493-502. 1935) continued his studies on the virus of tobacco mosaic and found that susceptibility to infection was increased by small doses of potassium sulphate, but markedly increased by large doses. J. A. Pinckard (*Journ. Agric. Res.* 50: 933-952. 1935) conducted physiological researches in connection with several pathogenic bacteria that induce cell stimulation in plants. James Johnson and Ismé A. Hoggan (*Phytopathology* 25: 328-343. 1935) offered a descriptive key for plant viruses based on

modes of transmission, whether by sucking insects, or by mechanical means, as grafting or plant extract.

Physiology. The effects of various agents upon plant growth and upon germination of seeds have been studied by many botanists. John M. Arthur and W. D. Stewart (*Contr. Boyce-Thomps. Inst.* 7: 131-146. 1935) found that by using 500-watt Mazda lamps for four hours daily as a supplement to sunlight the rate of growth and flowering of plants in a specially constructed greenhouse was practically equivalent to that in an ordinary greenhouse during the spring months. G. F. Nightingale (*Bot. Gaz.* 96: 581-639. 1935) studied the effects of temperature on growth, anatomy and metabolism of apple and peach roots. The maximum yield of current roots and tops occurred at a temperature in sand of 65° Fahrenheit. According to Roland McKee (*Journ. Am. Soc. Agronomy* 27: 642-3. 1935), the ability of seedlings to recover after having once started into active growth and subsequently dried varies widely. D. M. Simpson (*Journ. Agric. Res.* 50: 429-456. 1935) indicates that ripe cotton bolls contain a considerable proportion of dormant seeds, which germinate freely, however, after a short period of storage. Under ordinary storage conditions, cottonseed deteriorates rapidly after two years. P. W. Zimmerman (*Contr. Boyce-Thomps. Inst.* 7: 147-156. 1935) discussed the anæsthetic effects of CO, CO₂, propylene, butylene, ethylene, and acetylene mixed with oxygen. Ethylene, propylene, and acetylene are most effective on plants, but strangely enough are least so on insects and centipedes. According to László Havas (*Journ. Agric. Sci.* 25: 198-216. 1935) stimulatory effects upon germination and growth were observed in a wide range of dosages upon exposing seeds and seedlings to the emanations from a radioactive mud of Hungarian origin. Harris M. Benedict (*Bot. Gaz.* 96: 330-341. 1935) found that ultra-violet radiations between 2900 and 3100 Å, which have been proved to cause an increase in the calcium and phosphorus content of the blood of animals, produce in plants an increase in calcium but no definite result in the case of phosphorus. F. W. Went (*Bot. Review* 1: 162-182. 1935) studied the effects of auxin, the growth hormone, on plants. W. E. Loomis (*Ann. Bot.* 49: 247-272. 1935) observed that nitrogen synthesized to organic forms in the roots is normally moved upwards in the phloem, but the escape of organic nitrogen into the transpiration stream is not impossible. Walter S. Eisenmenger (*Plant Physiol.* 10: 1-26. 1935) found that organic aluminum compounds exert a distinct toxic effect upon corn, soy, and buckwheat, increasing with the increase of concentration. H. L. Francke (*Flora* 129: 1. 1935) made a detailed study of the symbiotic relationships of *Monotropa hypopitys*. The symbiosis is obligate, since sterile seeds fail to germinate, although a low rate of germination is obtained in presence of the fungus, which is probably a Boletus.

Taxonomy. A study of Elæagnaceæ by Aven Nelson (*Am. Journ. Bot.* 22: 681-683. 1935) led the author to conclude that the three genera into which this family has been divided (Elæagnus, Shepherdia and Hippophaë) may be better included in the single type genus. Charles J. Chamberlain (*Bot. Review* 1: 183-209. 1935) discussed the position of the gymnosperms from the taxonomic, morphologic, and cytogenetic standpoint. Albert C. Smith and Minna F. Koch (*Brittonia* 1: 479-543. 1935) presented a monograph of the South American composite genus *Espeletia*, which is

characteristic of the páramos or alpine meadows of the high Andes. The paper is a study in phylogenetic taxonomy. Henry K. Svenson (*Am. Journ. Bot.* 22: 208-267. 1935) catalogued the flowering plants collected by the Astor expedition of 1930 to the Galapagos and Cocos Islands, with a brief account of the vegetation.

At the general meeting of the Linnæan Society of London in April, 1935, a symposium was held on the species problem in phanerogams, and it was suggested that the word species should be eliminated as a scientific term, and should be replaced by some such word as morph or phenotype. There was general agreement that in view of the modern importance of cytogenetic and other factors the investigation of species should be undertaken with a much more complete analysis of a wider range of characters.

Necrology. Hugo de Vries (q.v.), professor of botany for many years at the University of Amsterdam, and first proponent of the theory that new species arise by sudden changes or mutations; Benjamin Lincoln Robinson, curator for 43 years of the Gray Herbarium of Harvard University; Asa Gray, for 35 years professor of systematic botany at Harvard; Elam Bartholomew, curator of the mycological herbarium at Kansas State College.

Bibliography. H. S. Jennings, *Genetics*, W. W. Norton Co., N. Y.; H. T. MacBride and G. W. Martin, *The Myxomycetes*, The Macmillan Co., N. Y.; *Monocotyledons*, Vol. II, "The families of flowering plants," The Macmillan Co., N. Y.; *The Gramineæ* (A study of cereal, bamboo, and grass), Cambridge University Press; Homer D. House, *Wild Flowers*, The Macmillan Co., N. Y.; *The Botanical Review*, edited by H. A. Gleason and E. H. Hall. Falling of the New York Botanical Gardens, began publication during the year.

BOURGET, bōōr'zhā', PAUL. A French novelist and critic, died in Paris, Dec. 24, 1935. Born in Amiens, Sept. 2, 1852, he was educated at the Lycée at Clermont and the Collège Sainte-Barbe and the École des Hautes Études, Paris. His literary début was made as a poet in 1872 with the publication of *Au bord de la mer*, but not until 1883 did his star begin to ascend, and then with the publication of his essays—*Essais de psychologie contemporaine*, in which his analytical powers, later to be used so successfully in his novels, were introduced. These were followed by *Nouveaux essais* (1885), and three volumes of *Études et portraits* (1888-89, 1906), a description of his visit to England, in which Bourget appears in his own words as "a moralist of the decadence," "a maniac of psychology," and "a passionate lover of analysis."

His visit to England brought forth his first novel, *L'Irréparable* (1884), which was followed by *Cruelle énigme* (1885); *Mensonges* and *André Cornélis* (1887). *Le disciple* (1889), considered one of his outstanding works, together with the two last-named books were compared by some critics with the works of Balzac and Flaubert. The appearance of *Physiologie de l'amour moderne* (1890) and *Sensations d'Italie* (1891), a delightful travel book, enhanced his reputation, and at the early age of 41 he was elected to the French Academy. In 1895 he was made an officer of the Legion

of Honor. His novels have been described as a seductive if somewhat sickly product of the hot-house of an outworn civilization, uniting intellectual keenness with morbid sensitiveness, dealing by preference with the cosmopolitan types of that low life which is usually called "high." His works of the 10 years 1890 to 1900 were concerned mostly with proving the incompatibility of passion and love, and include *La Terre promise* (1892), *Cosmopolis* (1892), *Un scrupule* (1893), *Une Idylle Tragique* (1896), *La duchesse bleue* (1898), *Drames de famille* (1900). After a visit to the United States in 1893, he wrote *Outre-Mer* (1895).

After 1900, Bourget became closely associated with the more conservative Catholic group, and his novel *L'Étape* (1902) was said by Brandes to be the one with which "he enters into the ranks of Catholic zouaves." His chief works of this period, while not always approved by the critics, became standard Catholic novels, and include *Un divorce* (1904), and *L'Émigré* (1907). In 1914 he wrote *Le Démon de Midi*, a valuable Catholic thesis-novel. His style was uneven, affected, incorrect at times, but capable of a terse simplicity that unites strength and beauty to a rare degree. His later work, though characteristic of his style, was somewhat thin and deteriorated in quality from his early successes.

Besides being a novelist of repute, he also won renown for his critical work, which in part was the cream of late 19th century French insight, the most representative being *Pages de Critique et de Doctrine* (1912). His attempts at writing for the theatre were not very successful. *Le Tribun* (1911), though interesting was poorly received, and *Le Crise* (1912), written in collaboration with André Beaumier, was still inferior. In 1913, his *Complete Works* (up to that time) were issued in 12 volumes. In 1922 the post of curator of the Palace of Chantilly was given to him, and in the following year he was made a Commander of the Legion of Honor.

Among other and later works of his may be mentioned. *La vie inquiète* (1874), *Edel* (1878), *Les aveux* (1882), all poetry; *Pastels* (1889), *Nouveaux Pastels* (1891), *Un Saint* (1892), *Un Crime d'amour* (1886), *Un Cœur de femme* (1890), *Voyageuses* (1897), *Recommencements* (1897), *Complications sentimentales* (1898), *Un Homme d'affaires* (1900), *Le Fantôme* (1901), *Monique* (1902), *L'Eau profonde* (1904), *Les Deux Sœurs* (1905), *Les Detours du cœur* (1906), *La Dame qui a perdu son peintre* (1908), *Sociologie et littérature* (1909), *La Barricade* (1910), *L'Envers du décor* (1911), *Un Cas de conscience* (1911), *Le Sens de la mort* (1915), *Lasarine* (1917), *Némésis* (1918), *Le Justicier* (1918), *Anomalies*, stories, (1920), *Laurence Albane* (1920), *L'écuyère*, stories, (1921), *Un Drame dans le Monde* (1921), *Nouvelles Pages de Critique et de Doctrine* (2 vols., 1922), *La Géole* (1923), *Cœur pensif*, ne sait ou il va (1924), *Confits intimes*, short stories (1925), *Le Danseur Mondain* (1926), *Nos actes nous suivent* (1927), *Le tapin*, *L'Enfant de la morte* (1928), and *Quelques témoignages* (1928).

BOURNE, böörn or börn, FRANCIS, CARDINAL. An English prelate of the Roman Catholic Church, died in London, Jan. 1, 1935. Born at Clapham, London, on Mar. 23, 1861, he was educated at St. Cuthbert's College, Ushaw; St. Edmund's, Ware; St. Sulpice, Paris, and at the University of Louvain, being ordained priest at Louvain in 1884. As a curate, he served at an orphan school in Blackheath, at St. Mary Magdalen's in Mortlake, and

at an orphanage in West Grinstead, Sussex. In 1889 he was appointed Rector of the Southwark Diocesan Seminary, which position he held until 1898. He went to Rome in 1895, where he was made Domestic Prelate by Pope Leo XIII. The next year he was elevated to the Bishopric, becoming titular Bishop of Epiphania and Coadjutor Bishop of Southwark, with the right to succession. Following the death of the incumbent, he became Bishop of Southwark and Ordinary in 1897, having jurisdiction over the counties of Kent, Surrey, and Sussex. In 1903, he succeeded Cardinal Vaughan as Archbishop of Westminster, which diocese took precedence over every other one in the country. In 1911 he was raised to the Cardinalate with the title of St. Prudeniziana, the name of Cardinal Wiseman's old titular church in Rome.

At the beginning of his archepiscopate, Bourne was faced with the possibility of the withdrawal of aid to non-provided or voluntary schools, as one of the election promises of the successful Liberal Parliament of 1905 was the undoing of such existing legislation. Backed by the Roman Catholic hierarchy of the country, the Archbishop opposed the Minister of Education successfully three times in the presentation of a bill hostile to the schools.

The Cardinal-Archbishop was always interested in the Eucharistic Congress and attended many of them, visiting the United States in 1910 after the Congress at Montreal. One of the most important events of his Cardinalate he considered the Congress held in London in 1908. During the World War, he was actively engaged in supplying chaplains for the fighting forces, and, being more than interested in the spiritual welfare of the men, made frequent trips to the troops in Belgium and France. In 1921 he aroused the antagonism of the Irish because he condemned the Sinn Féin riots and favored Home Rule. His opposition to the general strike of 1926 was largely instrumental in its failure, for on the first Sunday of the strike, he spoke strongly against it, saying that it had no moral justification and was a sin against obedience. Nevertheless, he was ever a friend of organized labor.

On the 500th anniversary of the death of Joan of Arc at Rouen in 1311, he was appointed Papal Legate, the first English Cardinal to be so honored. In Vatican Circles, the Cardinal was given credit for aid in formulating the principles upon which the government of Mussolini and the Holy See based their negotiations for the establishment of the Vatican as an independent Papal State, as for years he had contended that "civil independence of the Holy See might adequately be secured without detracting from the essential unity of the Kingdom of Italy."

He was known as an able administrator, and under his rule the Church in England grew to new proportions. He founded the National Catholic Congress, and established many churches in London for the convenience of his flock. The Cathedral at Westminster was dedicated early in his régime, and the debt considerably reduced. In 1934, he celebrated his golden jubilee as a priest.

Apart from reprinted pamphlets of his public addresses, his publications were limited to *Ecclesiastical Training* (1927); *Congress Addresses* (1929), addresses made at various meetings of the National Catholic Congress, and *Occasional Sermons* (1930).

BOWDOIN COLLEGE. An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment for the autumn session of 1935 was 620. There were 53 faculty members and five Teaching Fellows. The produc-

tive funds of the college amounted to \$7,692,000, and the income for 1934-35 was \$568,000. During 1934-35 over \$1,000,000 was added to the endowment fund from the estates of Charles P. Kling, John Hubbard, and John C. Coombs. The library contained more than 100,000 volumes. President, Kenneth Charles Morton Sills, LL.D.

BOWLING. Don Brokaw, 116-pound entry from Canton, O., was the surprise of the bowling season, one which showed increased interest in the sport in 1935. Brokaw won the national singles crown at the American Bowling Congress in Syracuse in the spring, bowling 733, a total only surpassed once in the last 10 years of the game. Brokaw's scores were 246, 242, and 245. Ora Mayer, of San Francisco, took the all-events championships, the first time a major title had gone to California.

Akron gained the doubles laurels with the team of Harry Souers and Clyde Sumerix and the five man event was captured by the Wolf's Tire Service Company five of Niagara Falls, N. Y. Hank Marino, of Milwaukee, succeeded Otto Stem jr. of St. Louis as national match champion, beating Stein in a 120-game series. Miss Marie Warmbier of Chicago dominated the women's play, winning the national match game, the women's international singles and the women's international all-events titles.

BOXING. The pugilistic sport, moribund to a great extent in the five previous years, suddenly was raised into a paying trade again in 1935 and indications were that 1936 would be livelier. Arenas were jammed for fights, ticket sellers beamed with delight, gymnasium proprietors gaped at the hordes of youths anxious to learn the game. And the "million dollar gate," almost considered something legendary, returned. And it all happened because of a big Negro boy from Alabama, by way of the automobile factories of Detroit—Joe Louis. He had come sauntering into rings in 1934 and at the close of the year was mentioned as a possibility for heavyweight honors. At the end of 1935 he was considered the uncrowned heavyweight champion of the world, and one of the finest, if not the finest fighting machine in the history of boxing.

Louis engaged in 14 fights in 1935, winning all of them and remaining undefeated in his entire professional career, which started July 4, 1934. He scored 12 knockouts in the 14 fights and easily outpointed his opponents in the other 2. His last 9 fights of the year were knockout triumphs, occupying only a total of 31 rounds. In his last four appearances he stopped Primo Carnera, former champion of the world, in 6 rounds; King Levinsky, feared for five years by most of the heavyweights, in 1; Max Baer, dethroned as heavyweight champion in June by James J. Braddock, in 4; and Paulino Uzcudun, the ancient Basque who had never been floored much less stopped in 10 years of campaigning, in 4, also.

The 21-year-old Negro displayed a punch unequalled since Jack Dempsey's time, but with a finesse and accuracy surpassing Dempsey's best blows. And Louis showed boxing skill worthy of Gene Tunney. None of his 1935 opponents, with the exception of Baer, struck him a clean blow. Baer's punch, struck after the bell ending the second round, was taken with disdain by Louis. This Baer-Louis fight, staged by Michael Strauss Jacobs at the Yankee Stadium in New York late in September, attracted 95,000 persons and a gross sum of \$1,000,000, the first since Dempsey's second battle with Tunney and the first in New York since the Dempsey-Sharkey fight in New York in 1927.

The Negro attracted huge crowds wherever he fought, drawing \$360,000 for his battle with Carnera in June in New York (\$155,000 more than the gate for the surprising defeat of Baer by Braddock) and drawing \$200,000 in Chicago in August for his one round demolition of Levinsky. Louis's share of the 1935 campaign was \$368,000.

The skill and drawing power of the Negro was just the adrenalin the fight game needed and other fighters shared in the profits and the public interest.

Seven new world's champions were crowned in the year. Jimmy Braddock, on the New Jersey relief rolls in January, was heavyweight champion in June. Braddock, a former challenger for the lightweight honors, was inserted into the heavyweight eliminations to select a Baer opponent and, after Carnera skipped to the Jacobs-Louis camp, was given the match. Baer was a one to five favorite at the ringside but Braddock clearly outpointed the champion, who didn't seem to be able to punch at all.

Barney Ross, the Chicago fighter, traded titles during the year. He abdicated the lightweight throne in April and relieved Jimmy McLarnin of the welterweight championship in New York in May. Tony Canzoneri, who had been beaten for the title by Ross, retrieved the lightweight championship in May, by beating Lou Ambers, considered the outstanding contender for the laurel. Bob Olin, who had taken the lightweight championship late in 1934, lost his title in his first actual defense, losing to John Henry Lewis, Arizona Negro, in St. Louis in the autumn. For the first time in almost a decade the muddled bantamweight championship was almost straightened out. Al Brown, the Panama Negro, was beaten by Balcazar Sangchilli, a Spaniard, for the championship, but there were rumors about the inability of both and Lou Salica and Sixto Escobar met in New York for the title, to be recognized by the boxing authorities of the United States. Salica won a disputed decision but in a return bout two months later, indoors, the clever Puerto Rican reversed the decision and became champion.

On the first day of 1935, Teddy Yarosz, middleweight champion (American edition, disregarding the skillful and bald Marcel Thil who fought only in France) was knocked out in an over-the-weight bout by Babe Risko, a Polish bellhop from Syracuse. Risko trailed Yarosz for the rest of the year, finally removing Yarosz's title in Pittsburgh. Risko was stopped in one round in New York in December by England's Jock McAvoy in a non-title bout. Small Montana succeeded Midget Wolgast as flyweight champion, and Freddie Miller, lefthander, retained his featherweight honors through virtue of a triumphant tour of Europe and the British Isles.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Each boy, on joining the organization, takes the scout oath, admonishing him to keep himself "physically strong, mentally awake, and morally straight." The movement is nonsectarian and without military or political connection.

The membership as of September, 1935, numbered 1,006,339, of whom 725,691 were scouts, 53,570 cubs, and 227,078 scouters and cubbers (adults connected with the movement, whether as scoutmasters, counselors, or committee members).

There were 12 regional districts under the direct supervision of the national scout executives and subdivided into 543 local councils.

Among the foremost scout activities are camping and hiking, nature study, sea scouting, and many kinds of athletics, and crafts, such as swimming, first aid, signaling, knot-tying, and bridge making. Successive ranks in membership—tenderfoot, second, and first class—are achieved by passing tests, graded in difficulty. Merit badges, more than 100 in number, may be attained by the scout of first class rank by meeting requirements for each; they cover proficiency in pursuits both of the useful and the hobby type. In order to attain higher ranks in scouting the boy must meet requirements for length of service, develop his leadership ability, and maintain his scout obligations. These and his earning a certain number of merit badges entitle him to the ranks of star, life, and eagle scout.

The official magazine for boys is *Boys' Life*, and for scout leaders, *Scouting*. The national officers in 1935 were: president, Walter W. Head; treasurer, Lewis Gawtry; national scout commissioner, Daniel Carter Beard; chief scout executive, James E. West; deputy chief scout executive, George J. Fisher. Headquarters of the national council are at 2 Park Avenue, New York City.

BRAZIL. A federal republic of South America, comprising 20 States, the Federal District, and one Territory. Capital and largest city, Rio de Janeiro.

Area and Population. With an estimated area of 3,275,510 square miles, Brazil had a population estimated at 47,794,874 in 1935 (30,635,605 at the 1920 census). The people of southern Brazil are chiefly of European descent, with Portuguese, Italian, Spanish, and German strains dominating, but there is a strong infusion of Negro and Indian blood in the north. The chief cities, with their approximate 1933 populations, were Rio de Janeiro, 1,500,000 (1,700,532 in 1935); São Paulo, 1,052,541 (1,151,249 in 1935); São Salvador, 852,081; Recife, 438,159; Belem, 300,233; Porto Alegre, 293,820; Bello Horizonte, 145,206; Fortaleza, 136,386; Maceió, 120,098; Niteroy, 119,297; Curitiba, 110,851. Immigrants in 1933 numbered 46,071; emigrants, 16,987. The language is Portuguese, but Italian and German are widely used in the south.

Education. The bulk of the population is illiterate, although education is free and, in seven States, nominally compulsory. President Vargas stated in 1933 that only 487 out of each 1000 Brazilian children enter primary schools and that barely 30 complete the primary grades. The children of the present generation are said to be growing up only 37.7 per cent "literate." In 1931 there were 33,049 primary schools, 1145 high schools, 87 colleges, 211 normal schools, and 943 special schools, with a total of 2,284,883 pupils.

Production. Over 70 per cent of the working male population is engaged in agriculture; coffee, cacao, sugar, and tobacco are the principal crops. The value of agricultural production in 1934 was 6,022,000,000 milreis (5,104,000,000 in 1933); of industrial production, about 6,000,000,000 milreis (5,500,000,000 in 1933). Brazil is the world's largest producer of coffee, which annually accounts for 60 to 75 per cent of the value of all exports. During the crop year ended June 30, 1935, Brazil delivered 14,859,421 bags (1 bag equals 132 lb.) out of total world coffee deliveries to consumption of 22,679,955 bags. In 1933-34, total world deliveries were 24,452,460 bags and Brazil's share was 16,-

062,870 bags. Brazil sells the bulk of its coffee output to the United States (11,561,955 bags in 1934-35 and 12,092,460 in 1933-34). The collapse of coffee prices from 24.8 cents per lb. in March, 1929, to about 7 cents in October, 1931, profoundly disrupted Brazil's economic system, the prosperity of which is largely dependent upon profitable prices for coffee. To maintain coffee prices, the Federal Government undertook to burn the coffee produced in excess of the demand, the destruction programme being financed by a tax of 15 shillings a bag on new coffee. Up to the end of 1934 about 34,000,000 bags had been destroyed. New coffee plantings were restricted also. While these measures prevented the complete collapse of the coffee industry, the price made only a moderate recovery to 10 cents a lb. during 1934 and dropped again in 1935 when estimates placed the 1935-36 crop at about 22,000,000 lb.

Production of other crops in 1934 (in bags of 132 lb.) was Corn, 108,000,000; rice, 25,000,000; sugar, 18,667,000; cacao, 1,500,000. Taking advantage of reduced acreage in the United States and higher world prices, Brazil increased her 1934-35 cotton crop to 1,591,000 bales (of 478 lb.) from 969,000 bales in 1933-34. Bananas, oranges, yerba maté, wheat, manioc, rubber, livestock, and timber are other products. Due to the protective tariff and exchange difficulties, domestic manufactures expanded rapidly during the world economic depression, particularly the production of textiles, chemicals, furniture, and cement. Manufacturing industries employed 510,000 workers in 1933, textile mills accounting for 39 per cent of the total. The number of industrial establishments was estimated at 50,885 in 1930. On Jan. 1, 1935, there were 338 cotton spinning and weaving mills, with 2,532,342 spindles and 81,158 looms. Mineral and metallurgical production in 1934 (in metric tons) was: Coal, 622,000; manganese ore (exports), 2,300; iron ore (1933), 30,000; pig iron and ferroalloys, 57,000; steel ingots and castings, 62,000. Gold output in 1934 was 4200 kilograms.

Foreign Trade. Imports in 1934 were valued at 2,502,785,000 milreis paper (2,165,254,000 in 1933) and exports at 3,478,903,000 milreis (2,820,271,000 in 1933). Imports were 15.6 per cent larger than in 1933 and exports 23.4 per cent larger. The United States furnished 23.6 per cent of the total 1934 imports (21 per cent in 1933); United Kingdom, 17.2 per cent (19.4); and Germany, 14 per cent (12.1). Of Brazil's total exports, the United States took 39.3 per cent (46.4 in 1933); Germany, 13 (8.1); and the United Kingdom, 12 (7.5). The value of the chief 1934 exports was (in contos, or 1000 milreis): Coffee, 2,114,521; raw cotton, 456,198; cacao, 149,833; animals and animal products, 256,443; yerba maté, 71,526; oil producing seeds, 66,716; oranges, 56,189; tobacco, 52,208. Machinery and tools, wheat, iron and steel, chemicals, drugs, etc., are the principal imports.

U.S. statistics showed imports from Brazil in 1935 of \$99,687,061 (\$91,484,306 in 1934) and exports to Brazil of \$43,617,614 (\$40,375,070 in 1934).

Finance. Under the Constitution of 1934 the fiscal year, ending March 31, was changed to coincide with the calendar year, effective in 1935. For the nine-months' period from April to December, 1934, the official Tribunal de Contas reported Federal revenues of 1,971,145,000 milreis (paper) and expenditures of 2,099,250,000 milreis, the deficit totaling 128,105,000 milreis, exclusive of extraordinary expenditures of 728,295,000 milreis covered by credit operations. The budget for the calendar

year 1935 estimated general revenues at 2,169,577,000 milreis and expenditures at 2,691,684,487 milreis, the anticipated deficit being 522,107,487 milreis. The 1935 figures include ordinary and extraordinary estimates.

The Federal public debt on Dec. 31, 1934, totaled 15,991,300,000 milreis (foreign, 9,358,200,000; domestic, 6,633,100,000), compared with 15,248,700,000 on Mar. 31, 1934. The foreign debt as of Dec. 31, 1934, was subdivided as follows: £106,450,712; \$174,197,045; gold francs, 228,989,500; paper francs, 296,736,900. The average exchange rate of the paper milreis in U. S. paper dollars was \$0.0796 in 1933, \$0.0848 in 1934.

Communications. Brazil in 1934 had about 22,280 miles of railway line, of which all except 4219 miles were owned by the Federal Government or the States. Electrification of the railways has progressed rapidly. Highways extended some 90,650 miles. In 1935 seven companies were operating commercial air lines aggregating 12,468 route miles. In addition the Brazilian Army Air Mail service was operating 4722 miles of line in 1935. During 1934 the Army mail planes flew 382,631 miles and carried 22,990 lb of mail. There are some 40,300 miles of navigable rivers. The net tonnage of vessels in the overseas trade entering Brazilian ports with cargo and in ballast during 1934 was 44,533,000; vessels cleared, 44,498,000 tons.

Government. The Constitution of the Second Republic, adopted July 16, 1934, vests executive power in a President elected for four years by secret vote of literate male and female citizens. The President is not eligible for reelection. Legislative power is concentrated mainly in a Chamber of Deputies of 300 members (250 elected by direct popular vote and 50 representing occupational and professional syndicates). There is also a Senate of 42 members (2 from each State), elected for eight years. The occupational representatives are chosen indirectly through occupational associations constituted for the purpose. The Constitution gives the Federal Congress large powers for the regulation of industry. The State governments exercise a large degree of autonomy, including the right to levy export taxes up to 10 per cent *ad valorem*. National defense, the income tax, and other obviously national functions are reserved to the Federal Government. Political parties are organized mainly on a State basis, there being no truly national political organizations. President in 1935, Dr. Getulio Dornelles Vargas of Rio Grande do Sul, who assumed office as Provisional President Nov. 3, 1930, following a successful revolution, and was elected Constitutional President for four more years on Oct. 14, 1934.

HISTORY

Political Developments. Although Brazil during 1935 continued the economic recovery inaugurated in 1934, there was no abatement of social unrest. The rapid growth of Fascist and ultra-radical political movements likewise continued, presenting the Vargas Government with its most pressing internal problem. Absorbed in the battle against the economic depression and in internal political strife, the Vargas régime up to 1935 had carried out only partially its promises of fundamental reforms in the political and economic fields. The agricultural system, based upon the production of coffee and other money crops for export by a comparatively few wealthy, landowning families, kept the masses of the rural population in a state of miserable peonage. The economic condition of the industrial workers, although better than

that of the *colonos* (peons), was distinctly worse than in many European countries which had sent class-conscious emigrants to man the machines in Brazil's rapidly expanding industrial establishments.

Among the rural and urban workers, deprived of any appreciable stake in the existing system and compelled to bear the brunt of the economic depression, the years after 1930 witnessed a rapid spread of ultra-radical and Communist sentiment, from which the lower ranks of the army were not immune. Radical sentiment found its chief expression in a growing number of industrial strikes, in which members of the illegal Communist party played a leading part. The growth of radicalism was matched by the rapid development of Fascist organizations, of which the so-called Integralist Action—an intensely nationalistic, anti-Communist, and pro-Catholic group—was easily the most important. By 1935 the Integralists claimed to have 200,000 members in their green-shirted private militia, units of which were organized in seven States and the Federal District. The movement was said to have between 500,000 and 700,000 followers.

As the first truly national organization in Brazil, the Integralist movement promised to inaugurate a new period in Brazilian politics. It originated in São Paulo, following the unsuccessful Paulista counter-revolution of 1932, and was designed primarily to overthrow the Vargas Government, which then showed a radical tendency. The rapid growth of the Integralist militia, coupled with the increasingly frequent clashes between Integralists and radicals, led the Federal Congress to pass the National Security Law, signed by President Vargas Apr. 5, 1935. The law provided that "only the State has the prerogative to form a militia of whatever nature" and authorized the imprisonment of Fascist and radical leaders under certain circumstances. However, the law did not prohibit the wearing of colored shirts and Fascist emblems and the Integralists declared that, since they were not armed, the law did not apply to them. Their leader, Plinio Salgado of São Paulo, asserted the Integralists would resist any attempt to dissolve the organization and none was made during the year, although Congress on November 21 petitioned the government to dissolve it as a menace to public order.

Events confirmed the fears of the radicals that the National Security Law was aimed principally at them. On July 13 President Vargas signed a decree closing the headquarters of the *Aliança Nacional Libertadora*, an ultra-radical group. This action was upheld by the Supreme Court August 22. There were frequent arrests of Communists and other radicals on charges of spreading subversive propaganda and radical demonstrations were repeatedly repressed by troops. Violent clashes between Communists and Integralists continued. In June, shortly after Communist-Fascist disorders in Petropolis, an Integralist parade in São Paulo was called off to avoid further bloodshed. According to reports, the government showed itself increasingly sympathetic to the Fascists as the year progressed. Rising discontent in the army led the President to approve pay increases on May 15; at the same time he vetoed a bill granting higher salaries to other governmental employees. Political turmoil in the State of Pará in April forced President Vargas to appoint a new Federal interventor, under whom new elections were held. On April 28 the Constituent Assembly, which drafted the new

Constitution and thereafter served as the legislative arm of the government, was dissolved to make way for the regularly elected Congress.

Discontent among army non-commissioned officers and privates, affiliated with the disbanded *Allianca Nacional Libertadora*, led to a serious revolutionary outbreak on November 24. Revolted troops seized Natal and Recife, capitals of the States of Rio Grande do Norte and Pernambuco. While loyal troops were crushing these insurrections, two sympathetic outbreaks occurred among the troops stationed at Rio de Janeiro. The Vargas Government proclaimed martial law throughout the country for 60 days on November 25, and on November 28 it announced the complete suppression of the revolt. The uprising was crushed only after severe fighting in which 138 were killed, hundreds wounded, and 1300 soldiers placed under arrest. The rebels sacked Natal before being driven out by the loyalists, and were said to have carried off large sums from some of the banks.

The uprising was planned by the outlawed *Allianca Nacional Libertadora*. While the government accused this organization of planning a Communist régime, the *Allianca* in a manifesto circulated immediately after the revolt denied this charge. It asserted that the movement aimed at the confiscation of foreign capitalistic enterprises in Brazil, distribution of the large landed estates among small farmers and workers, and a relatively mild programme of labor and social legislation.

A clamor for more drastic suppression of radical and Communist activities swept Brazil following the revolt, with the Vargas Government sponsoring the movement. A score of foreign radicals said to be implicated in the revolt were deported. On December 12 Congress passed the National Security Act providing for the dismissal and imprisonment of public employees and members of the military services participating in revolts. Martial law was suspended for 48 hours on December 16 to enable Congress to pass further emergency legislation in the form of constitutional amendments. On December 17-18 Congress rushed through by a vote of 210 to 59 a measure giving the President extraordinary powers to declare a state of war in case of revolt, thus putting all rebels under the jurisdiction of military courts. At the request of President Vargas, Congress on December 21 approved the declaration of a state of war throughout the entire republic for 90 days to enable the government to root out political opponents. As the year closed Congress was considering legislation for the expulsion of all alien agitators against the existing régime, whether Communist or Fascist, and the training of teachers to combat communism by cultural means. The trial of several hundred of the November rebels under the newly enacted National Security Act was scheduled for early in 1936.

Economic Issues. The regulation of foreign exchange transactions remained the major problem confronting Brazil in the economic sphere. The exchange control system established in September, 1931, was modified in the direction of a freer exchange market by a number of decrees issued in 1934. A further step in the same direction was taken on Feb. 11, 1935, when the Bank of Brazil announced that all export bills must be sold at the "free market" rate of exchange, but that purchasing banks were obliged to transfer to the Bank of Brazil 35 per cent of their exchange in sight drafts on London or New York. For goods cleared through the customs after February 11, exchange

cover had to be bought in the "free" exchange market. On June 19, 1935, however, all purchases in the "free" market were made subject to the approval of the Bank of Brazil. Subsequent changes in exchange regulations during August and September introduced considerable confusion and uncertainty which handicapped the development of foreign trade.

The continued shortage of foreign exchange made it likely that Brazil would again be forced to suspend the partial payments which it was making on its foreign debts. In an effort to avoid this the government sent a financial mission to the United States and Great Britain to adjust the complex financial and commercial issues involved. On February 2 the mission signed a reciprocal trade agreement with the United States, ratified by the Brazilian Congress November 15. The United States agreed to retain coffee and cacao, the chief Brazilian exports, and 10 other commodities on its free list and to grant tariff concessions on Brazil nuts, castor beans, manganese ore, and a few other items. In return Brazil granted concessions on imports of fruits, radios, films, automobiles and parts, electric refrigerators, and many other items from the United States. It agreed not to increase or impose rates on 13 additional items and not to discriminate against the United States in the allotment of foreign exchange. Brazil promised to provide sufficient exchange to pay for future imports from America, liquidate the existing American deferred commercial indebtedness, and service Brazilian bonds held in the United States. The effect of the U. S. Supreme Court's gold clause decision early in 1935 was to reduce Brazilian indebtedness to American security holders by \$145,424,000 and to reduce the annual service on the American debt by \$15,350,000. On account of the depreciation of the milreis, however, Brazil was unable to obtain the full benefit of the Supreme Court decision.

On March 27, the Brazilian financial mission signed an agreement in London for the settlement of commercial debts owed to British exporters. Brazil agreed to issue 4 per cent sterling bonds to the British creditors and to service these bonds from a special fund of £1,200,000 to be set aside annually from the percentage of foreign exchange reserved for government requirements. Cash payment of all the smaller accounts was to be made within 30 days. A French commercial mission, which visited Brazil during August, secured an agreement for the partial thawing out of French credits blocked in Brazil, which were reported to total about 50,000,000 francs.

Foreign Relations. The main developments in Brazil's foreign relations during 1935 were the strengthening of her political and commercial ties with Argentina and Uruguay through the official visit which President Vargas made to Buenos Aires and Montevideo in May and June; Brazil's active coöperation with Argentina in the negotiation of the truce of June 12, 1935, between Bolivia and Paraguay; and the action of the Brazilian Senate in killing a proposal for recognition of the Soviet Union. In Buenos Aires President Vargas signed a series of agreements with Argentina. During the Chaco peace negotiations at Buenos Aires, the Argentine and Brazilian Foreign Ministers were reported to have pledged the honor of their respective countries that they would not permit the peace conference to adjourn without reaching a definitive agreement for direct settlement or arbitration of the territorial dispute. Brazil was the first of the Pan American countries to form a

local committee of the Inter-American Commercial Arbitration Commission, organized in September, 1934, in accordance with a resolution adopted at the Montevideo Conference in December, 1933. See ARGENTINA and BOLIVIA under *History*; PAN AMERICAN UNION.

Although Congress on October 8 adopted a resolution condemning Italy's attack on Ethiopia, the Vargas Government early in November bluntly refused to collaborate with the League of Nations in the application of economic sanctions against Italy. As a result Brazil profited by the foodstuffs and raw materials sold to Italy at high prices. A considerable number of Italian colonists in Brazil went home for military service in Ethiopia and the large Italian colony remaining undertook to boycott goods of Great Britain and the other sanction-applying powers.

Consult Horace B. Davis, "Brazil's Political and Economic Problems," *Foreign Policy Reports*, Mar. 13, 1935.

BREASTED, JAMES HENRY. An American archaeologist and historian, died in New York City, Dec. 2, 1935. Born in Rockford, Ill., Aug. 27, 1865, he was educated at North Central College (1888); the Chicago Theological Seminary (1888-90); Yale University (1892); and the University of Berlin (1894). Upon his return from Germany in 1895, he joined the staff of the University of Chicago as an instructor in Egyptology, subsequently becoming, in addition, an instructor in Semitic languages, and in 1905, full professor of Egyptian and Oriental history. By 1905 he had translated all of the historical documents of ancient Egypt down to the Persian period (*Ancient Records of Egypt*), an achievement which formed the basis for his *History of Egypt*, a work which is still the standard in its field. In 1915, he was appointed chairman of the Department of Oriental languages and literatures. The year after his association with the University began, he was appointed assistant director of the Haskell Oriental Museum. Meanwhile, he collaborated on the Imperial Egyptian Dictionary at Berlin, and in 1900 was commissioned by the Royal Academies of Germany to tour the museums of Europe in order to copy the Egyptian inscriptions in those museums for the dictionary. Upon his return in 1901, he became director of the Haskell Museum.

From 1905 to 1907, Dr. Breasted led two expeditions to Egypt, where he began the classification and copying of the inscriptions on the then existing monuments, a work he was obliged to discontinue for lack of funds. Returning to America in 1908, he devoted himself to a special study of the ancient Egyptian religion and published his findings in *The Development of Religion and Thought in Ancient Egypt* (1912). Impressed by the inadequate teaching of ancient history in American schools, he compiled an ancient history, entitled *Ancient Times* (1916; rev., 1935).

Through the aid of John D. Rockefeller, Jr., a research laboratory—the Oriental Institute of the University of Chicago—was established in 1919 and Dr. Breasted was made its head. Research projects were launched in Chicago and in the Near East. Among the projects carried on at Chicago is a comprehensive dictionary of the cuneiform documents of Western Asia. In Cairo and the museums of Europe, another staff, Coffin Texts Project, was engaged in copying Egyptian coffin text documents, forerunners of the Egyptian Book of the Dead. Another staff, Epigraphic and Architectural Survey Expedition, resumed the task of saving

the temple inscriptions of ancient Egypt. The prehistoric Survey Expedition was organized in 1926 to collect and study all the surviving traces of prehistoric man in Egypt.

As a result of a preliminary expedition through western Asia in 1920, Dr. Breasted developed a plan for a five-year campaign of systematic excavation at Armageddon (Megiddo) in Palestine (Megiddo Expedition). In 1926 he also dispatched an exploring expedition into the ancient Hittite region of northwest Asia Minor, which subsequently discovered a whole series of long-forgotten towns and cities of the Hittites. This Hittite or Anatolian Expedition began to receive support in 1927 from the General Education Board for a five years' campaign, and until 1933, was excavating the mound of Alishar. In 1928 an expedition was dispatched to Iraq, to excavate the palace of Sargon II at Khorsabad. The work of this expedition was subsequently extended also to ancient Babylonia. In 1930 Dr. Breasted inaugurated an expedition in north Syria between Aleppo and Alexandretta at a mound called Chatal Huyuk, and later the project was extended to include the mound of Tell Jedeideh. In this same year he launched an expedition to excavate Persepolis, which, since 1931, has been at work. The reports of the various expeditions and researches, as well as translations of original documents, are published regularly in four main different series of volumes issued by the Institute.

In 1925, the University relieved him of all his teaching duties that he might devote himself to the work of the Institute, and in 1933 he retired in order to devote his time solely to that organization. His last visit to the Near East was made in the fall of 1935, where he had gone after attending the International Congress of Orientalists in Naples.

Dr. Breasted's work, which was of the utmost value to the Institute and to Oriental scholarship, consisted principally in the investigation of the origins and early history of civilization, beginning with Egypt and extended to include the history of Western Asia. It was his belief, which he set forth in several of his volumes, that social and moral development was first seen in Egypt, and that the key to the origin of modern ethics and philosophy might very well be found in the sands along the Nile.

In addition to his long years of teaching at the University, and his work in the East, he found time to deliver the Morse lectures at the Union Theological Seminary (1912); Earl lectures at the Pacific School of Religion of the University of California (1918; 1930); Hale Foundation lectures at the National Academy of Sciences, Washington (1919); Haskell lectures, Oberlin College (1922); first Messenger lectures, Cornell University (1925), and first Mary Flexner lectures, Bryn Mawr College (1929).

His valuable work brought to him many honors, including the Gold Medal of the Geographic Society of Chicago (1929); the Rosenberger Gold Medal for his contributions to the history of civilization (1929); the Gold Medal of the Holland Society of New York (1930); and the Gold Medal for distinguished achievement in the Fine Arts awarded by the American Institute of Architects (1934). He held membership in all the important academies and societies throughout the world, and was president of the American Oriental Society (1918); the History of Science Society (1926); the American Historical Association (1928), and

served as a trustee of the American School of Oriental Research (1930-33).

Besides acting as associate editor of the *American Journal of Semitic Languages* and of *Biblical World*, and contributing to various foreign scientific journals, his works include: *A New Chapter in the Life of Thutmose III* (1900); *A History of Egypt* (1905; 2d ed., 1909); *Ancient Records of Egypt* (5 vols., 1905); *The Temples of Lower Nubia* (1906); *A History of the Ancient Egyptians* (1908); *The Monuments of Sudanese Nubia* (1908); *Outlines of European History*, with J. H. Robinson (1914); *A Short Ancient History* (1914-15); *Survey of the Ancient World* (1919); *History of Europe, Ancient and Medieval*, with J. H. Robinson (1920); *Ancient History Atlas* (1920); *General History of Europe*, with Robinson and Smith (1921); *The Oriental Institute of Chicago, A Beginning and a Program* (1922); *Oriental Forerunners of Byzantine Painting* (1924); *Victorious Man* (1926); *Conquest of Civilization* (1926); *The Oriental Institute* (vol. xii of U. of Chicago Survey, 1933); *The Dawn of Conscience* (1933). Also, he translated an extraordinary Egyptian surgical treatise written on papyrus in the 17th century B.C., which was brought out of Egypt by Edwin Smith. It was published under the title, *Edwin Smith Surgical Papyrus* in two volumes, one in 1928; the other in 1930.

BRETHREN, CHURCH OF THE. A church established in 1719 at Germantown, Pa. It originated at Schwarzenau, Germany, in 1708, and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of the group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh Day Baptists; and Old Order German Baptist Brethren.

There were on Sept. 30, 1935, in the 49 district conferences of the United States and Canada, 1563 churchhouses, of which 218 were in cities, and 1345 in small towns and rural districts. These churchhouses represented 1034 congregations. The total membership was 159,128. Foreign mission work was carried on in India, China, and Africa. The church membership in India was 5213; in China 1708; and in Africa 100. Africa, the newest mission, was launching out very strong in evangelism, education, and general medical service, with a large leper colony.

The denomination supports the following colleges: Bridgewater, in Bridgewater, Va.; Blue Ridge, in New Windsor, Md.; Elizabethtown, in Elizabethtown, Pa.; Juniata, in Huntingdon, Pa.; Manchester, in North Manchester, Ind.; McPherson, in McPherson, Kans.; and La Verne, in La Verne, Calif. Bethany Biblical Seminary is located in Chicago. The *Gospel Messenger* is the official church paper.

The officers presiding at the 1935 general conference were: Dr. C. C. Ellis, moderator; the Rev. Rufus D. Bowman, reader; the Rev. J. E. Miller, secretary. The moderator-elect for 1936 was Dr. D. W. Kurtz. This conference, which was held at North Manchester, Ind., took strong grounds against the liquor traffic and a stand in favor of peace and a warless world. The Committee on Fraternal Relations reported progress.

Headquarters of the four general boards of the church—mission, Christian education, ministerial, and general education—and of the Brethren Publishing House are in Elgin, Ill.

BRIDGEMAN, WILLIAM CLIVE BRIDGEMAN, FIRST VISCOUNT, OF LEIGH. A British statesman, died at Minsterley, England, Aug. 14, 1935. Born in London, Dec. 31, 1864, he was educated at Eton and at Trinity College, Cambridge, where he won classical honors in 1887. In 1889 he began a governmental career as an assistant private secretary to Lord Knutsford, the Colonial Secretary. In 1895 he became assistant private secretary to Sir Michael Hicks-Beach, and two years later a member of the London School Board for Hackney. After making several unsuccessful attempts to enter parliament he was finally elected as a Unionist member of Parliament by Oswestry in 1906. Five years later he became a junior Opposition whip.

In the first coalition ministry formed during the World War, Viscount Bridgeman was a Lord Commissioner of the Treasury (1915-16) and later served as Assistant Director of the War Trade Department. He became Parliamentary Secretary to the Ministry of Labor in 1916, and was private secretary to the Board of Trade from 1919 to 1920, becoming in the latter year, Secretary of Mines, a position he held until 1922, when Bonar Law appointed him Home Secretary. During his occupancy of this office, he had charge of the internment and deportation of Irish prisoners in England, and his actions in the discharge of this duty were declared illegal by the Court of Appeals. For his protection, an Indemnity bill was passed.

When the second Ministry of Stanley Baldwin was formed in 1924, Bridgeman was created First Lord of the Admiralty, and served until 1929. During his tenure of office he pushed the Singapore naval base project against Liberal and Labor opposition, and led the British delegation to the unsuccessful Geneva naval parley of 1927. He fought against any reduction of British naval strength and defeated Winston Churchill, Chancellor of the Exchequer, in his attempt to cut down the cruiser programme in the interests of economy. In 1925, he acted as government mediator in the mine labor dispute, but his efforts were unsuccessful, and in the following year a general strike occurred. He was one of the ministers who objected to the efforts of the Prime Minister to avert the strike and threatened to resign if they were carried out.

He was made a Privy Councillor in 1920 and three years later an Ecclesiastical Commissioner. Created a viscount in 1929 Bridgeman resigned from the House of Commons, after having served there for 23 years. In 1933 he became a governor of the British Broadcasting Company, and subsequently its chairman, a post he held until his death.

BRIDGES. The unprecedented bridges under construction at San Francisco still demand the first attention of the bridge engineer. These have been described in previous YEAR BOOKS.

Bay Bridge. Progress in this unique combination of twin suspension spans west of Yerba Buena Island and of a huge cantilever span with a long approach on the east, has been rapid during the year. Cable spinning on the suspension spans is under way and, together with the unique and difficult foundation construction for this portion of the undertaking, has resulted in this work receiving more attention than the great east cantilever span. As a matter of fact, the main span of the San Francisco-Oakland cantilever will be second to none of its type in the United States and ex-

ceeded only by the famous Quebec, Canada, and the older Firth of Forth, Scotland, bridges. Its 1400 ft. makes it 200 ft. longer than the Longview highway bridge over the Columbia River and, in addition, the provision for six lanes of vehicles on the upper and three lanes plus two rapid transit tracks on the lower decks, makes it an extremely heavy bridge—actually greater in transportation capacity than the two larger spans noted.

The plan being followed is to carry through the erection by the cantilever method throughout—the suspended span will not be hoisted into place as was done at Quebec and at the nearby Carquinez Straits bridge. The bridge is also interesting in that 16 per cent of the steel tonnage used is nickel steel, 40 per cent silicon steel, 34 per cent carbon steel, and 10 per cent specially heat-treated eyebars. While the details are not quite as huge as those on the Quebec cantilever, the sections of members are, by comparison with usual bridge work, of extraordinary size and steel pins as large as 24 in. in diameter are used at the connections.

Buzzard's Bay Lift Bridge. Plans to widen the Cape Cod Canal to 500 ft have required the construction of several new bridges (see 1934 YEAR BOOK). The 544 ft span railroad lift, which replaces the old 160 ft bascule bridge, is said to set a record span for lift bridges. The span is suspended by 80-2½ in diam wire ropes passing over four 15 ft diam sheaves, each of which sheaves carries a million pound load and rotates on roller bearings.

Concrete Trusses. Various forms of trusses, built of reinforced concrete, have been used in Europe but the type has found little favor with American engineers. The recent completion of a 170 ft through-truss highway span at Tacoma, Wash., sets a record for this type in the United States. A unique feature is the provision for sidewalks on each side of the bridge by means of openings left in the lower portions of the truss members. These members are extremely wide, 7 ft., and 3 ft wide openings for foot passengers have been provided.

Continuous Truss Bridge at Omaha. This new highway crossing over the Missouri River at Omaha, Neb., recently completed, is interesting both because it is a notable continuous truss span (two trusses of 525 ft. span each), and because its main span was built over, not an existing, but a future river channel. The War Department proposed radical changes in channel location at this point and the bridge was planned to meet the final channel plans.

Davenport, Iowa, Bridge. Serving the Tri-Cities group of Moline and Rock Island, Ill., and Davenport, Ia., this 740 ft. main span suspension bridge with continuous truss approaches, was opened in November. Spanning the pool formed by the Rock Island navigation dam three miles below, the bridge is of particular interest because of unique construction methods. Instead of the usual traveling crane, a floating-tower derrick was used in erecting the structural steelwork of the bridge.

Golden Gate. By November, the delay, due to foundation difficulties, in the construction of the south tower of this record 4200 ft suspension span had been met, the tower rapidly erected, cable spinning equipment installed, and cable spinning was under way. The two cables will be 36 inches in diameter, and a new arrangement of spinning wheels and haulage ropes will be followed. Instead of carrying each wheel the entire length of

the bridge, anchorage to anchorage, the travel will be only half this length, the bridge wires being transferred to the returning wheels at the centre of the span. The schedule calls for completion of the spinning operation by August, 1936.

New Orleans Bridge, THE. Located about 3½ miles above New Orleans, this combination railroad, vehicular, and pedestrian bridge is one of the longest bridges in the world—almost 4½ miles. It was opened for traffic early in December. It is the 29th bridge to span the Mississippi, and is, of course, the southernmost span over the river. A cantilever span of 790 ft. with anchor arms of 528 ft. is combined with a through-truss span of 531 ft., and four deck-truss spans of 267 to 330 ft. for the main channel crossing. Long viaduct approaches were necessary to secure, with reasonable grades, the required channel clearance of 135 ft. Extensive use was made, in the construction of this bridge, of silicon steel and of heat-treated eyebars, and it thus typifies modern practice in the field of bridge construction.

Oregon Coast Highway Bridges. An interesting programme, involving five important bridges to replace older ferries, is under way on this coast highway. A few years ago all of these bridges would have been considered remarkable structures, but to-day, although these works have many interesting features, they create no new records and pass almost unnoticed. The Yaquina River crossing involves a 600 ft steel arch, that at Alsea Bay two 154 ft and one 210 ft tied arches of concrete. Siuslaw River crossing also uses two 154 ft. tied concrete arches together with the double leaf bascule span. At the Umpqua River bridge a 430 ft. swing span is used and at Coos Bay, a cantilever bridge 793 ft centre to centre of towers which provides 120 ft. clearance for a width of 527 ft. These bridges were financed by PWA funds on a toll redemption basis.

Raquette River, N. Y. The recently completed two 150 ft. truss spans of this bridge, which are of completely welded construction, set a new American record for this type of bridge construction which is only 11 ft under the world record. The bridge is a 20 ft. wide highway structure on the international toll highway about 9 miles east of Massena, N. Y. The trusses are of the through Pratt type.

Rio Grande. It is seldom that bridges are completely submerged by floods but the concrete arch Laredo Bridge over the Rio Grande has been twice subjected to complete submergence. In order to prevent the railing from holding jams of driftwood, the older concrete railing on this bridge has been replaced with a light movable railing made of aluminum.

Rip Van Winkle Bridge, N. Y. Spanning the Hudson near Catskill, N. Y., this State Bridge Authority toll bridge, was opened for traffic in July. The main span is an 800 ft. cantilever with 142 ft. clearance. A long trestle approach was required at the east end.

Triborough Bridge, N. Y. The redesign of this long combination of structures has permitted work to go rapidly forward. Cable spinning on the main span over the East River was completed and most of the floor system placed by the end of the year. The approach structures are also well advanced and tower work on the 125th St. lift span is under way.

Parkway approaches are an important element in modern highway bridge plans. The so-called Inter-

borough Parkway on Long Island, which is an important feature of this bridge development, was opened in November.

FOREIGN BRIDGES

La Roche-Guyon Bridge, France. This through type concrete arch bridge with the remarkable span of 528 ft. was completed over the Seine in France. The two hingeless arch ribs are heavily reinforced with tiers of spiral coils and the deck is hung from reinforced-concrete hangers. Although less in span than the famous arch at Brest, this bridge is said to be the longest span of its kind in the world. As is usual in recent French work, the arch ribs are hollow and were built in forms suspended by cables running from three falsework towers built on piles driven in the river bottom. With American labor conditions the complicated reinforcement used in this bridge would have been excessively costly to fabricate, and the American engineer would also question the wisdom of using the daring method in supporting the forms, a method requiring highly skilled workers.

Waterloo Bridge, London, England. Designed by the famous British engineer, John Rennie, and opened in 1817, this bridge over the Thames at Westminster consisted of nine semi-elliptical arches of 120 ft. clear span. Serious settlement of the fifth pier which developed in 1923 later became worse. A temporary bridge was opened in 1925 and now the old structure is being demolished to make way for a new and wider bridge.

BRIGHAM YOUNG UNIVERSITY. A co-educational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. In the 1935 summer session 670 students were enrolled; the autumn session enrollment was 2088. The faculty numbered 119 members. The library contained 100,000 volumes. The budget for the year was \$324,000. A new life science building was completed in 1935 at a cost of \$100,000. President, Franklin Stewart Harris, Ph.D.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in York, England, in 1831, and incorporated by Royal Charter in 1928, for the purpose of fostering the interests of workers in all branches of science and to give a stronger impulse to scientific research, both theoretical and practical.

The annual meeting was held in Norwich, England, Sept. 4-11, 1935, under the presidency of Prof. W. W. Watts, who opened the session with an address entitled "Form, Drift, and Rhythm of the Continents." His paper was in the nature of a review of the theories that have been advanced to account for geological resemblances between the continents of the eastern and western hemispheres and for other points of close similarity.

The addresses delivered by the sectional presidents were equally notable. These included "The Story of Isotopes," by F. W. Astor (mathematical and physical sciences); "The Molecular Structure of Carbohydrates," by Prof. W. N. Haworth (chemistry); "Some Geological Aspects of Recent Research on Coal," by Prof. H. G. A. Hickling (geology); "The Species Problem," by Prof. F. Balfour-Browne (zoology); "Some Aspects of the Polar Regions," by Prof. F. Debenham (geography); "Economic Nationalism and International Trade," by Prof. J. G. Smith (economic science and statistics); "The Stability of Structures," by J. S. Wilson (engineering); "Recent Progress in the Study of Early Man," by Sir Arthur Smith Woodward (anthropology); "The Pituitary Body and the Diencephalon," by Prof. P. T. Herring (physiology); "Personality and Age," by Dr. L. Wynn Jones (psychology); "Some Aspects of Plant Pathology," by F. T. Brooks (botany); "Education and Freedom," by A. W. Pickard-Cambridge (educational science); "The Financial and Economic Results of State Control in Agriculture," by J. A. Venn (agriculture).

The evening discourses were given by Dr. S. J. Davies on "Diesel Engines in Relation to Coastwise Shipping," and by Dr. C. S. Myers on "The Help of Psychology in the Choice of a Career."

The officers elected at the meeting were Sir Josiah C. Stamp, president; Prof. P. G. H. Boswell, general treasurer; F. T. Brooks and Allan Ferguson, general secretaries; and O. J. R. Howarth, secretary. Headquarters are at Burlington House, London.

BRITISH CAMEROONS. See CAMEROONS, BRITISH.

BRITISH COLUMBIA. The most westerly province of Canada. Area, 366,255 sq. miles, exclusive of salt-water area. Population (1934 estimate), 725,000 compared with 694,263 (1931 census). During 1934 there were 9744 births, 6372 deaths, and 4767 marriages. Chief towns: Victoria, the capital, 39,082 inhabitants in 1931; Vancouver, 246,593; New Westminster, 17,524; North Vancouver, 8510; Trail, 7573; Nanaimo, 6745.

Production. The preliminary estimated total value of field crops for 1935 was \$13,244,000 (\$12,749,000 in 1934) of which wheat (1,531,000 bu) represented \$1,271,000, oats (5,037,000 bu), \$2,116,000; potatoes (95,250 tons), \$1,810,000, turnips, etc. (60,450 tons), \$731,000; hay, clover, and fodder corn (531,000 tons), \$5,860,000; grain hay, \$990,000. In 1934 the province had 294,400 cattle, 173,100 sheep, 58,262 horses, and 46,300 swine. Fur production (1933-34): 160,438 pelts valued at \$961,108 of which mink (46,284 pelts) accounted for \$462,840; beaver (12,523 pelts), \$125,250.

Mineral production (1934) was valued at \$41,206,965 of which gold (296,196 fine oz.), \$10,218,762; lead (344,467,138 lb.), \$8,392,597; copper (48,246,924 lb.), \$3,579,583; silver (8,729,721 fine oz.), \$4,143,204; zinc (249,152,403 lb.), \$7,583,202; coal (1,485,969 short tons), \$5,351,108. Mineral production (1935) was estimated to value \$47,807,157 including gold, \$14,261,200, lead, \$10,206,000; zinc, \$7,862,400; silver, \$5,547,057; coal, \$4,887,500; copper, \$2,979,600. The fisheries catch for 1934 amounted to 3,666,000 cwt. valued at \$15,234,335 of which salmon accounted for \$12,351,000. In 1933, including Yukon Territory, there were 1697 factories, with 30,896 workers, from which the value of products was \$145,490,955 gross and \$75,195,257 net.

Government. For the year ended Mar. 31, 1935, total revenue was \$22,761,719; total expenditure, \$21,597,544; gross debt, \$172,463,172, sinking fund, \$32,717,498. The government included a lieutenant-governor aided by an executive council, and a legislative council of 48 members. The province was represented in the Dominion Parliament at Ottawa by 6 Senators and 16 members in the House of Commons. Lieut.-Gov. in 1935, J. W. F. Johnson; Premier, T. D. Pattullo (Liberal). See CANADA.

BRITISH EAST AFRICA. See KENYA, TANGANYIKA, and UGANDA.

BRITISH EMPIRE. An empire consisting of (1) GREAT BRITAIN and NORTHERN IRELAND, Channel Islands, Isle of Man, (2) IRISH FREE STATE, INDIA, and the various British Dominions, Colonies, Protectorates, and Dependencies. Including the mandated territories of CAMEROONS, NEW GUINEA, PALESTINE, NAURU, SOUTH-WEST AFRICA, TANGANYIKA, TOGOLAND, WESTERN SAMOA, the British Empire had a total area of 13,355,426 sq. miles and an estimated population of 495,764,000 (1933-34). Consult these articles.

BRITISH GUIANA, *gê-a'-na*. A British colony in South America. Area, 89,480 sq. miles; population (Jan. 1, 1935, estimate), 323,171 including 10,585 Europeans, 136,004 East Indians, and 127,301 Negroes. During 1934 there were 9301 births, 7980 deaths, and 1563 marriages. Capital, Georgetown, 64,207 inhabitants.

Production and Trade. The main products during 1934 were sugar (132,240 tons), rice (55,122 tons of paddy), coconuts, diamonds (44,820 carats), gold (27,691 oz.), bauxite (64,889 tons), timber, balata, and coffee. Livestock in the colony (1934): 149,662 cattle, 17,809 sheep, 14,110 swine, 8980 goats, 6127 asses, 2888 horses, 1612 mules, and 82 buffaloes. Matches, boots, and shoes, edible oil, and cigarettes were manufactured in the colony. In 1934, imports were valued at £1,750,006, exports (including reexports), £1,894,131 of which sugar accounted for £1,160,094.

Government. For 1934, revenue (from all sources) amounted to £1,272,002; expenditure, £1,205,427; public debt (Jan. 1, 1935), £4,510,715 against which the sinking fund on Jan. 1, 1934, amounted to £671,666 (mean market value). Government was vested in a governor aided by an executive council, and a legislative council. Governor in 1935, G. A. S. Northcote.

BRITISH HONDURAS, *hôn-dôo'-ras*. A British crown colony in Central America. Area, 8598 sq. miles; population (Jan. 1, 1935 estimate), 54,744. Belize, the capital, had 16,687 people in 1931. During 1934 there were 1945 births, 971 deaths, and 450 marriages.

Production and Trade. The main products were mahogany and logwood, chicle, bananas, coconuts, citrus fruits, plantains, sugar, and rice. During 1934, imports were valued at \$1,912,375, exports, \$1,520,917. The exports of mahogany in 1934 totaled 4,679,085 cu. ft.; chicle, 787,526 lb.; bananas, 293,293 bunches (of which 287,000 bunches went to the U.S.A.). The total tonnage of shipping entered and cleared during 1934 was 491,249.

Government. The financial year was changed to the calendar year. For the nine months, April 1 to Dec. 31, 1934, revenue (including Colonial Development Fund grants) was \$627,591 including \$99,600 received as a loan grant-in-aid of administration from Great Britain; expenditure, for the same period, was \$816,811. The funded public debt on Jan. 1, 1935, was \$2,982,042 (exclusive of \$155,376 outstanding on account of loan works) against which the accumulated sinking funds amounted to \$355,035. Government is vested in a governor assisted by an executive council of 6 members and a legislative council of 13 members. Governor and Commander-in-Chief in 1935, Sir A.C.M. Burns.

BRITISH MALAYA. The Malay peninsula under British control comprising the Federated Malay States, Straits Settlements, and Unfederated Malay States (see the separate articles on these divisions). Total area, 51,001 sq. miles; total population (Dec. 31, 1934, estimate), 4,413,830 in-

cluding 2,075,000 Malaysians, 1,649,000 Chinese, 596,780 East Indians, 19,350 Europeans, and 16,920 Eurasians.

Production and Trade. Trade statistics cover only the above mentioned divisions. Rubber (479,371 tons), tin, (37,786 tons), pineapples, copra, palm oil, sugar, rice (29,310,875 bu.), areca nuts, timber, gold (29,453 oz.), and resin were, in 1934, the principal products. During 1934, total imports were valued at \$471,435,000; exports, \$568,487,000. Total rubber shipments during 1934 amounted to 681,897 tons valued at \$281,207,000; tin, 50,186 tons, \$96,724,000. Of the imports Netherland India sent \$159,808,000; Great Britain, \$67,335,000; British Possessions, \$72,248,000; Japan, \$38,000,000; U.S.A., \$88,256,566. The U.S.A. received \$188,555,000 of the exports; Great Britain, \$107,294,000; British Possessions, \$67,216,000; Japan, \$51,381,000; Netherland India, \$36,452,000 (\$ averaged \$0.5901 for 1934).

Communications. During 1935 telephone service with Siam was put into operation. A new air service of Imperial airways between British Malaya and Hong Kong was to be inaugurated on Oct. 1, 1935.

BRITISH NORTH BORNEO. A British protectorate occupying the northern area of the island of Borneo. Area, 31,106 sq. miles; population (1931 census), 270,223 of whom 340 were Europeans. The chief towns were Sandakan, the capital, which had 13,826 inhabitants, and Jesselton.

Production and Trade. Rubber, timber, sago, rice, coconuts, gums, coffee, and tobacco were the main products. In 1934, total imports were valued at \$4,790,050; total exports, \$10,052,094 of which rubber represented \$4,866,523; timber, \$2,256,681; leaf tobacco, \$159,552 (Straits \$ averaged \$0.5901 for 1934). The state railways carried 110,635 passengers during 1934 as compared with 76,066 during 1933.

Government. For 1934, revenue (exclusive of land sales) totaled \$2,662,908; expenditure, \$1,640,254. The territory was under the jurisdiction of the British North Borneo (Chartered) Company and was administered by a court of directors in London, and a governor (approved by the British Secretary of State). Governor in 1935, D. J. Jardine.

BRITISH SOLOMON ISLANDS PROTECTORATE. See SOLOMON ISLANDS, BRITISH.

BRITISH SOMALILAND. See SOMALILAND, BRITISH.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. The British sphere in West Africa. See CAMEROONS, BRITISH; GAMBIA; GOLD COAST; NIGERIA; SIERRA LEONE.

BRITISH WEST INDIES. The British possessions in the West Indies comprising (1) BAHAMAS, (2) BARBADOS, (3) JAMAICA with Turks Islands, (4) LEEWARD ISLANDS, (5) TRINIDAD with Tobago, (6) WINDWARD ISLANDS. See the separate articles.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in the social sciences. Established in Washington, D. C., in 1927, it maintains as operating units the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had at least two years of graduate work are accepted as research fellows.

In carrying out its purpose to aid constructively in the development of sound national policies with-

out regard to the special interests of any group, whether political, social, or economic, the institution conducted during 1935 several significant investigations. The resulting studies were published under the following titles: *The Formation of Capital*; *The National Recovery Administration: An Analysis and an Appraisal*; *Wheat and the AAA*; *Tobacco under the AAA*; *Marketing Agreements under the AAA*; *The Dairy Industry and the AAA*; *Livestock under the AAA*; *Cotton and the AAA*; *Labor Relations Boards*; *Income and Economic Progress*; *Cartel Problems*; *International Organizations in which the U. S. Participates*; *Public Welfare Organization*; *Hours and Wages Provisions in NRA Codes*; *The Warren-Pearson Price Theory*; *The Thirty Hour Week*.

The institution is supported from endowment funds and annual grants. The officers of the board of trustees for 1935-36 were: chairman, Frederic A. Delano; vice chairman, Leo S. Rowe; treasurer, Henry P. Seidemann; and president, Harold G. Moulton. Headquarters are at 722 Jackson Place, Washington, D. C.

BROOKLYN COLLEGE. A coeducational institution of higher education in Brooklyn, N. Y., founded in 1930 as one of the three institutions of higher learning supported by municipal taxes and administered by the Board of Higher Education. The others are Hunter College and the City College. The enrollment for the autumn of 1935 was 10,687 of whom 5228 were in the Day Session, 4704 in the Evening Session, 231 in the Maxwell Division, 358 in Courses for Teachers, and 168 in the Graduate Division. The 1935 summer session had an attendance of 2687. The faculty numbered 419, including 14 additions. The budgetary allowance for 1935 was \$1,612,127. There were 35,308 volumes and 296 periodicals in the library. Brooklyn College received a Federal grant for the erection of buildings. Ground was broken Oct. 2, 1935, and the contracts provide that the five buildings be completed by December, 1936. President, William A. Boylan.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An institution in Brooklyn, N. Y., composed of four divisions—education, museum of arts and sciences, children's museum, and a botanic garden. It was founded in 1824 and incorporated in its present form in 1890. Membership, about 9000, is open to all who are interested in any branch of science or art. The education division is divided into the following departments, composed of members interested in a particular field: Agriculture, astronomy, botany, dramatic art, engineering, ethnology, fine arts and architecture, geography, geology, music, pedagogy, philology, philosophy, photography, physics, political science, psychology, and zoology. These departments conduct courses and sponsor addresses, lectures, and concerts. The enrollment in the school of pedagogy in 1935 was 2805 with an attendance at lectures of 284,726.

The institute's museums contain collections in the fields of art, ethnology, and natural science; its botanic garden comprises more than 50 acres. Attendance at the museums during the year was 1,501,329 and at the botanic garden, 1,626,029. The library contains more than 27,000 volumes. In 1935 the permanent funds of the institute amounted to \$3,878,032.60; the funds to meet current expenses totaled \$734,376.80. The president of the board of trustees is Edward C. Blum; director of the division of education, Charles D. Atkins; of the muse-

um of arts and sciences, Philip N. Youtz; of the children's museum, Anna B. Gallup; and of the botanic garden, C. Stuart Gager. Headquarters are at Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

BROWN UNIVERSITY. An institution of higher education in Providence, R. I., founded in 1764, it has three major subdivisions: The College, for undergraduate men, Pembroke College for undergraduate women; and the Graduate School. The College includes a division of engineering. The enrollment in the autumn of 1935 was 1240 undergraduate men, 492 undergraduate women, and 285 graduate students. The faculty consisted of 227 members. The productive fund of the university on June 30, 1935, was \$10,304,992. The income for year ending June 30, 1935, was \$1,509,923. Gifts and bequests during the academic year amounted to \$257,627. The libraries contained approximately 500,000 volumes. President, Clarence Augustus Barbour, D. D., LL.D.

BRUNEI, brōō-nī'. A British protectorate in Borneo. Area, 2500 sq miles; population (Jan. 1, 1934), 32,900 compared with 30,135 (1931 census). Brunei, the capital, had 10,453 inhabitants. Cutch, rubber, jelutong, sago, and crude oil were the principal products. In 1934, imports were valued at £220,226; exports, £395,653; revenue, £75,252; expenditure, £63,584; public debt, £44,123. Brunei was ruled by a sultan but general administration was in the hands of the British Resident (in 1935, R. E. Turnbull).

BRUNSWICK. See GERMANY under *Area and Population*.

BRYN MAWR COLLEGE. An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1935 totaled 508. The teaching staff numbered 85. The productive funds of the college amounted to \$6,087,757 and the receipts for the year 1934-35 were \$902,187. The number of volumes in the library was \$150,000. President, Marion Edwards Park, Ph.D., LL.D.

BUCKLE, GEORGE EARLE English journalist and author, died at Chelsea, Mar. 13, 1935. Born at Twerton-on-Avon, near Bath, England, June 10, 1854, he received his education at Winchester College and New College, Oxford, where he won the Newdigate Prize in 1875, and honors in literature in 1876 and in modern history in 1877. From the latter date until his marriage in 1885, he was a fellow of All Souls' College, Oxford. Admitted to the bar of Lincoln's Inn in 1880, he never practiced but entered journalism in the same year and became assistant editor of *The Times* of London. On the death of Thomas Chenerly in 1884, Buckle succeeded to the editorship, and held the post until his retirement in 1912.

The paper covered such important events as the fight for Home Rule, the fate of the Ministries, and Queen Victoria's first jubilee in 1887. It was during his editorship that *The Times* published, on Apr. 18, 1887, the alleged Parnell letter which was later declared by the Parnell Commission to be a forgery. Richard Pigott confessed to having made the forgery. Parnell brought an action against *The Times* for libel and claimed £100,000 damages but the case was settled out of court for £5000. Because of this incident, Buckle offered his resignation but it was declined. In the reign of King Edward, there was the Entente with Russia and France, and the project for a British Commonwealth of Free States, both of which were supported by *The Times*. It also gave modified support to Mr. Chamberlain's

campaign for tariff reform. During the period of his retirement, he was left to finish the *Life of Disraeli*, an original undertaking of W. F. Monypenny, a former associate on *The Times*. At the end of eight years (1920) Buckle completed the work which was hailed as one of the most authentic biographies in the language. Then followed the editing of the later correspondence of Queen Victoria, and on the completion of that work, Buckle was complimented by King Edward for a masterpiece of historical value. At the time of his death, he was engaged in writing an authoritative history of *The Times*.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1935 the enrollment was 1085, of whom 689 were men and 396 women. At the junior branch in Wilkes-Barre, Pa., there were 193 students. There were 427 students enrolled in the summer session of 1935. The faculty numbered 78. The productive funds amounted to \$1,303,863 and the income for the year was \$610,000. The library contained 70,000 volumes. A \$6,000,000 programme was launched in 1934 to increase endowment and provide new buildings. This is a 12-year programme to be completed for the centennial in 1946, the first building of which was erected in 1935. Acting President, Arnaud C. Marts.

BUCKWHEAT. As estimated by the Department of Agriculture the 1935 buckwheat production of the United States, 8,234,000 bu., was 9 per cent less than the 1934 crop of 9,042,000 bu. but quite close to the average of 8,277,000 bu., the average for the five years 1928-32. The area harvested in 1935 was 496,000 acres, an increase of about 3.8 per cent over the acreage in 1934. This increase in acreage was more than offset by a decrease in the average yield from 18.9 bu. per acre in 1934 to 16.6 bu. in 1935. The yield per acre in the principal producing States, New York and Pennsylvania, was substantially lower than in 1934. The 1935 farm price as preliminarily estimated was 53.5 cents per bu. as compared with 58.6 cents, the average price for the crop marketing season of 1934, and on this basis the total farm value of the crop in 1935 was \$4,404,000 compared with \$5,296,000 in 1934.

The 1935 buckwheat crop as reported was produced in 22 States, the estimated yields of the leading States being as follows: Pennsylvania 2,847,000 bu., New York 2,380,000 bu., Ohio 420,000 bu., Michigan 378,000 bu., and West Virginia 340,000 bu. These States produced about 75 per cent of the total yield. During the fiscal year ended June 30, 1935, the United States exported 55,000 bu. of buckwheat.

BUFFALO, THE UNIVERSITY OF. A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846. The enrollment in the various schools for the autumn of 1935 was 1620; in addition there were 1588 students in the extension division. The faculty numbered 435. The enrollment for the 1935 summer session was 543. The new Lockwood Memorial Library containing the Lockwood collection of rare books (2500 volumes) was completed during 1935. It was the gift of Thomas B. Lockwood. The libraries of the university now contain 110,057 volumes and 90,000 pamphlets. Chancellor, Samuel P. Capen, Ph.D., L.H.D.

BUILDING. According to its annual survey of the building permits issued in 215 major cities throughout the United States, *Dun & Bradstreet,*

Inc., report a marked upturn in the building industry in 1935. In these cities the value of permits for new buildings, alterations, and repairs reached the total of \$596,686,708, greater by 71.3 per cent than the total in 1934 of \$348,390,747, and the greatest since 1931. In that year the total was \$1,158,963,273, and in 1927 the building permits in the same cities aggregated \$3,419,479,046. In other words, though building permits showed a definite trend toward recovery in 1935, their aggregate values were still but 17 per cent of the 1927 aggregate.

Though the building permits issued in every month of the year exceeded those for the corresponding months of 1934, the greatest activity occurred in the three closing months. The upward trend was general throughout the country, with only 39 of the 215 cities in the survey reporting decreases from the previous year. By geographic groups, the records compiled by *Dun & Bradstreet, Inc.*, for residential and non-residential building permit values for 1934 and 1935 are shown in the accompanying table.

**BUILDING PERMITS IN THE UNITED STATES
FOR 25 CITIES [From *Dun & Bradstreet, Inc.*]**

Groups	1935	1934	Change %
New England . . .	\$ 41,748,198	\$ 31,788,639	+ 31.3
Middle Atlantic . . .	197,031,051	123,986,089	+ 58.9
South Atlantic . . .	65,290,987	40,737,271	+ 60.3
East Central . . .	96,293,932	50,406,917	+ 91.0
South Central . . .	54,980,200	27,242,066	+ 101.8
West Central . . .	38,352,892	21,984,304	+ 74.5
Mountain . . .	12,190,531	5,692,070	+ 114.2
Pacific . . .	90,798,917	46,553,391	+ 95.0
Total United States	596,686,708	348,390,747	+ 71.3
New York City . . .	141,397,239	82,989,652	+ 70.4
Outside New York City	455,289,469	265,401,095	+ 71.6

From the records compiled from the entire country, *Engineering News-Record*, New York, in its annual review number reported that residential building showed a gain of 92 per cent over 1934, and was estimated at \$479,000,000; private engineering work, which includes multiple-family dwellings, gained 54 per cent, and was estimated at \$742,000,000. The estimated total of construction of all types was \$3,681,000,000, of which \$2,460,000,000 was public works. The total is a gain of 19 per cent over the 1934 volume, and 51 per cent above that of 1933, though it is still only 42 per cent of the 1926 normal. The report states further "New productive capital made available in 1935

**CONSTRUCTION BY CLASSES AND GEOGRAPHIC
SECTIONS (000,000 OMITTED)**

	1935	1934

for construction purposes totaled \$1,782,000,000, exclusive of appropriations and allotments for Federal work. Of this amount the bulk was PWA grants and loans which amounted to \$1,208,000,000. Other State and municipal financing was \$497,000,000, about double that of the previous year."

A classification of construction contracts reported during the year to *Engineering News-Record* is shown in the last table on page 105.

BULGARIA. A Balkan monarchy. Capital, Sofia. King in 1935, Boris III, who succeeded to the throne Oct. 3, 1918.

Area and Population. With an area of 39,825 square miles, Bulgaria had a population at the census of Dec. 31, 1934, of 6,090,215 (5,478,741 at the 1926 census). In 1926 Bulgarians comprised 81.32 per cent of the total population. Births in 1933 numbered 174,095; deaths, 92,561; and marriages, 55,886. The census populations of the chief cities in 1934 were: Sofia, 287,976; Plovdiv (Philippolis), 100,485; Varna, 70,183; Ruse (Ruschuk), 49,388; Burgas, 36,099; Pléven (Plevna), 31,764; Sliven (Slivno), 30,683. The Orthodox faith is the state religion.

Education. According to the 1926 census, 26.53 per cent of the male population and 53.60 per cent of the female population were illiterate. In 1932-33 there were 5509 national and private elementary schools, with 703,066 pupils; 2050 national and private secondary schools, with 251,699 pupils; the State University at Sofia, with 7204 students, and various other special and vocational schools. In all there were 7921 schools, with a total attendance of 993,050.

Production. About 81 per cent of the population is engaged in agriculture and fishing; 9 per cent in industry, and less than 3 per cent in commerce. The area under cultivation is about 10,219,000 acres, while forests cover 7,426,340 acres. Yields of the chief crops in 1934, with 1933 figures in parentheses, were (in 1000 metric tons): Wheat, 1,131.6 (1,601.9); rye, 167 (276); barley, 185.5 (359.9); oats, 73 (155.6); corn, 819.5 (1043); potatoes, 113 (77); sugar beets, 201 (185.9); grapes, 304.9 (280.5); tobacco, 14.9 (17.5). The beet sugar production declined in 1934-35 to 2200 metric tons from 40,400 tons in 1933-34. The wine (must) yield in 1934-35 was 3,049,000 hectoliters. Other products are attar of roses, fruits, and silk cocoons. Coal production in 1934 was 76,000 metric tons (80,000 in 1933); lignite, 1,561,000 metric tons (1,494,000). Output of other minerals in 1933 was (in metric tons): Lead, 1200; bauxite, 2200; salt, 5680. Manufacturing is but little developed. In 1926 the 197,784 industrial establishments (mostly home industries) employed 368,022 persons.

Foreign Trade. Imports in 1934 were valued at 2,229,483,000 leva (2,202,256,000 in 1933) and exports totaled 2,534,630,000 leva (2,846,349,000 in 1933). Textiles, metals, machinery, and mineral oils were the most important imports in value, while the chief exports were, in order of importance, tobacco, eggs, corn, wheat, and attar of roses. Of the 1934 imports, Germany supplied 901,529,000 leva; Italy, 176,150,000; Belgium, 167,441,000; United Kingdom, 142,869,000. Germany purchased exports to the value of 1,082,971,000 leva; Italy, 232,772,000; Austria, 134,888,000; and Switzerland, 121,928,000 leva.

Finance. Closed accounts for the fiscal year ended Mar. 31, 1934, showed gross revenue receipts, excluding those of the state railways, ports and coal mines, totaling 5,159,500,000 leva and ex-

penditures of 5,496,600,000 leva, the deficit being 337,100,000 leva. Effective Jan. 1, 1935, the fiscal year was changed to coincide with the calendar year. For the short period Apr. 1 to Dec. 31, 1934, budget estimates anticipated a deficit of 324,000,000 leva on receipts of 3,673,500,000 leva. For the calendar year 1935 the budget estimates envisaged a deficit of 430,800,000 leva on total receipts of 5,264,300,000 leva.

The public debt on Mar. 31, 1934, totaled 21,840,400,000 leva (foreign, 14,675,700,000; domestic, 7,164,700,000). The lev (par value, \$0.0122) exchanged at an average of \$0.01 in 1933 and \$0.0129 in 1934.

Communications. The state-owned railways in 1933 had 1655 miles of standard-gauge and 262 miles of narrow-gauge line. Highways extended about 10,800 miles (state roads, 4650 miles). The Danube River is an important traffic artery, 10,270 vessels of 1,844,204 tons entering the Bulgarian river ports in 1933. The net tonnage entered at all ports in the overseas trade during 1934 totaled 2,061,000; tonnage cleared, 2,069,000.

Government. Under the Constitution of 1879 the King exercised executive power through a cabinet appointed by him but responsible to the National Assembly (*Sobranie*) of 274 members elected for four years. This Constitution was suspended by the dictatorship headed by Col. Kimon Georgiev, which seized power through a *coup d'état* on May 19, 1934. By the decree of June 14, 1934, all political parties were dissolved and the formation of new ones prohibited. Colonel Georgiev announced his intention of drafting a new constitution establishing a corporative state on the Italian model. Meanwhile administration was carried on by means of decree-laws. For developments in 1935, see *History*.

HISTORY

Boris Regains Control. Failure of the Georgiev dictatorship to deal effectively with the country's serious economic and financial problems, coupled with dissension among the army officers supporting the dictatorship, enabled King Boris to reestablish his supremacy early in 1935. The efforts of Premier Georgiev to deprive Boris of all his powers had reached such lengths by the end of 1934 that a strong reaction occurred against the dictator among army officers as well as among the people generally. Georgiev, backed by Col. Damyon Veltchev, the real organizer of the anti-parliamentary *coup d'état*, was said to have forbidden Cabinet members to consult with the King without the Premier's permission. The King's photographs and accounts of demonstrations in his honor were excluded from the newspapers. The government even demanded power to appoint and dismiss Cabinet members and army officers independently of the King.

Early in January Boris took a firm stand in behalf of his prerogatives, refusing to dismiss a number of army officers at the demand of War Minister Zlatev. In the ensuing crisis a strong group of army officers, including General Zlatev himself, swung over to the King's side. Colonel Georgiev was forced to submit the resignation of the entire cabinet on January 22. The Georgiev-Veltchev faction was eliminated from the new cabinet formed soon afterwards by General Zlatev. The new Premier announced, however, that, except for confirming the King's prerogatives, the new ministry would follow the policies inaugurated by the Georgiev Government.

Zlatev Cabinet Resigns. In pursuing the same dictatorial policies the Zlatev Government ran into new difficulties which offered the King another opportunity to strengthen his precarious and delicate position. On April 18 the government arrested former Premiers Tsankov and Georgiev, the former on a charge of attempting to revive the dissolved Democratic Party and the latter because he attempted to publish a defense of his policies in response to the strictures against him broadcast by Premier Zlatev. Three civilian members of the cabinet resigned in protest at this extreme policy. Their action, combined with the tense situation in the capital where large-scale riots threatened, forced the resignation of the entire Zlatev Ministry late the same day. Passing over the leaders of rival military factions, King Boris entrusted the Premiership to Andrew Tochev, a civilian unaffiliated with any political faction. The new civilian cabinet contained only one member of the Zlatev Ministry and none at all of the Georgiev Ministry. The military leaders, angered at their exclusion, prepared to force the King to accord them recognition. Boris nipped this conspiracy in the bud by placing the ringleaders under arrest and stationing troops in all the public buildings. On April 22 he signaled his victory by freeing the two arrested ex-Premiers and ordering steps towards a return to constitutional government.

The struggle between the King and the Georgiev-Veltchev group was not ended, however. They remained antagonistic on vital questions of internal and external policy. Under the Tochev Ministry, dominated by the King, preparations were made for a return to parliamentary government and the campaign of extermination waged against the Imro (Internal Macedonian Revolutionary Organization) by the Georgiev Government was ended. Through the government's tolerance and even sympathy, the Mihailovist faction of the Imro began to regain its dominant position in Bulgarian politics. Equally distasteful to the Georgiev-Veltchev group was the King's action in reverting to the pro-Italian foreign policy abandoned by the Georgiev dictatorship in favor of a Bulgarian-Yugoslav rapprochement. On the eve of a great demonstration in Sofia in celebration of both the King's accession to the throne and the proclamation of Bulgarian independence, the government on October 2 declared martial law throughout the country and announced that it had nipped in the bud a widespread conspiracy to overthrow the King. The following day Premier Tochev accused ex-Premier Georgiev and Colonel Veltchev of planning to murder the King, the Queen, the members of the Cabinet, and other leading public figures and army officers. The two alleged ringleaders and more than 250 of their adherents in the capital and the provinces were placed under arrest.

Although it was widely believed in Bulgaria that the Premier had exaggerated the charges against the Georgiev-Veltchev faction in order to pave the way for drastic measures against them, the government on October 18 magnified the extent of the conspiracy by dismissing 79 army officers. It announced that 41 additional officers would be dismissed soon and that 37 remained under arrest. Court martial proceedings against 23 officers were instituted on October 22. Three of them, including Colonel Veltchev, were charged with offenses punishable by death. Several high army officers were reported to have resigned in protest against the government's action. Moreover it was

reported that some members of Premier Tochev's Cabinet disapproved his pro-Italian policy and had induced King Boris to continue Bulgarian collaboration with the neighboring states of the Little Entente and Balkan Entente, particularly with regard to the application of League sanctions against Italy. It was significant that Bulgaria joined with the other League members in restricting its economic relations with Italy, effective November 18.

The Kiosseivanov Ministry. Continued internal dissension, combined with pressure for a return to constitutionalism from the former political parties, forced the resignation of the Tochev Cabinet on November 23. A new ministry was formed the same day by George Kiosseivanov, Foreign Minister under Premier Tochev. The new ministry was regarded as a provisional one designed to hold new elections early in 1936 and prepare the way for a return to constitutional government. The new War Minister, General Lukov, took a firm stand against participation of the army in politics. Nevertheless unrest continued in the army, particularly after the trial of Colonel Veltchev, former Finance Minister Todorov, and 28 other high military officers was begun at Sofia December 18. The trial was viewed as an effort by King Boris and his pro-Italian supporters to crush the movement for rapprochement with Yugoslavia which was led by Colonel Veltchev.

The Spread of Communism. While the King was engaged in his successful struggle against his opponents, communism continued its spread among the peasants, laborers, students, and even the army officers with a rapidity which aroused widespread misgivings. Early in the year all labor organizations in Philippopolis were suppressed on the ground that they had become hotbeds of communism. From at least ten other towns or villages came reports of the discovery of Communist plots. On September 13 more than 80 alleged Macedonian Communists were arrested in Sofia and Petritch, charged with conspiring to establish a soviet republic. It was obvious that the harsh measures resorted to against the movement in 1934, when 50 alleged Communists were sentenced to death, had had no effect in checking Bolshevik propaganda.

Relations with Turkey. Charged by Greece with having increased its army beyond the 33,000 men allowed by the Treaty of Neuilly, Bulgaria further aroused the suspicions of the other Balkan States by concentrating troops along the Greek border during the civil warfare in that country in March, 1935 (see GREECE under *History*). Turkey, an ally of Greece, then concentrated troops along the Bulgarian border, arousing the Sofia Government to the point of calling the matter to the attention of the League of Nations. While this incident was tidied over without difficulty, the Turks maintained their troops near the Bulgarian frontier and constructed extensive defense works. In August, after a conference of Bulgarian military leaders with the King, it was decided to construct permanent fortifications for the defense of the town of Haskovo in Southern Bulgaria. See TURKEY under *History*.

BURGENLAND. See AUSTRIA.

BURMA. A province of British India. Total area, 261,610 sq. miles including Burma proper, with Chin Hills, and Kachin Hill Tracts (192,158 sq. m.), Shan States (62,335 sq. m.), and unadministered territory (7117 sq. m.). Total popula-

tion (1931), 14,667,146. Rangoon, the capital, had 400,415 inhabitants; Mandalay, 147,932. There were 728,834 pupils in the schools and colleges during 1932-33. Buddhism was the religion of 85 per cent of the population.

Production. Rice was the main agricultural product. Cotton, millet, tobacco, and sesamum were also grown. Teak was an important export product from the forests. Tin (2944 tons), tungsten ore (895 tons), silver (6,054,907 oz.), and petroleum (962,218 metric tons) were the principal mineral products in 1933. In the same year there were 942 factories with a total of 86,433 persons employed.

Communications. In 1934 there were 2056 miles of railway open to traffic: 2120 miles of paved and 7729 miles of unpaved highways; and 60 miles of navigable canals. The Irrawaddy, the main artery of commerce, was navigable for 900 miles from the sea; its tributary, the Chindwin, for 300 miles.

Government. For the fiscal year ended Mar. 31, 1934, revenue totaled Rs85,966,000; expenditure, Rs99,310,000. The revised estimates for 1934-35 indicated a surplus of Rs2,920,000. Budget estimates (1935-36): revenue, Rs80,514,000; expenditure, Rs90,139,000 (rupee averaged \$0.3788 paper for 1934; \$0.3696 for 1935). In 1923 Burma was constituted a Governor's Province under the government of India Act of 1919. There was an appointive executive council, and a legislative council of 103 members (80 elected; 23 nominated, and ex-officio). The Shan States were administered by the local chiefs under the supervision of the Commissioner of the Federated Shan States. Governor in 1935, Sir H. L. Stephenson.

History. Reversing the position adopted in 1934, the Legislative Council of Burma in April, 1935, defeated by a vote of 47 to 37 a proposal for federation with India under the new Indian Constitution (see INDIA under *History*). The British scheme for constitutional reform called for the establishment of Burma as a separate state under its own constitution. In 1934 a majority of the Legislative Council voted for federation with India, believing that afterwards Burma would be able to withdraw from the federation with a greater degree of self-government than that promised by the new Burman Constitution. The Council in April, 1935, also rejected a motion expressing dissatisfaction with the draft constitution for Burma, but passed for the second time a proposal to oust the British President of the Council, Sir Oscar de Glanville. The Governor accepted the latter motion, despite his disapproval of the Council's action, and U Chit Hlaing, leader of the majority party, was named to the post. A joint British-Chinese commission to fix the boundary between Burma and Yunnan Province in China was appointed in April, 1935.

BUSINESS REVIEW. The various uncertainties in business which had seemed to grow more pronounced during the late months of 1933, prolonged themselves only during the mid-winter and the very early spring of 1934, and were followed by a decided betterment of economic conditions which left the year 1935, in the opinion of most observers, the unmistakable beginning of a period of recovery. It is well to bear in mind that, in the present unsettled state of economic life, apparent predictions of this sort may not prove permanently well-founded, but so far as contemporary data are concerned, the returns of 1935 made it clear that there was a distinct improvement of the essential elements of production

and trade. Thus far, at any rate, we seem warranted in speaking of the year as marking the long desired "turn for the better." Doubt still exists as to the cause for such improvement, and consequent doubt may be entertained as to its desirability; but this discussion refers entirely to matters of the past and present.

In reviewing the year 1935, we may make a major division at the beginning of spring, treating the months of January, February, and part of March, as more truly belonging to the preceding year, economically speaking, while the subsequent months are represented in almost continuous development of improvement in production, dividends, and quotations of securities. Such changes were not uniform in all branches. Manufacturing improved in the spring of the year. During the early months which are here spoken of, as the first period, in fact the combined index of production, computed by the Federal Reserve Board, revealed a growing tendency. Whereas the figure for the month of December, 1934, was only 78, this level was raised in January to 88, and in February and March to 91. Subsequent months did not do as well, until the year was far advanced, but there was no month in the year that did not materially exceed the production index for the corresponding period a year earlier. The price level went slightly higher during the early months of the winter, and appeared throughout to be more stable than during the latter part of 1934. During the final months some branches of production and some phases of prices appeared to be in the early stages of "boom"; but, it should be added, largely as the result of fortuitous conditions presently to be mentioned.

Most observers of business development during 1935 are disposed to place a large degree of emphasis upon the governmental and political occurrences of the twelvemonth as direct factors influencing the course of events. Suits before the Supreme Court culminated in April in a decision adverse to the so-called "NRA," leaving it without constitutional warrant, and practically cutting the foundation from under the great structure of bureaucratic control which had been built up by it. The announcement of the decision was at first received with some degree of uncertainty, not a few—even of those who disliked the "NRA"—feeling that perhaps it had furnished an element of strength in the reorganization of industry whose withdrawal might be injurious.

As against this development, but coming somewhat later, must be mentioned as major business factors, the enactment of far-reaching Federal laws including: (1) the new tax bill, with highly confiscatory rates, directed against large incomes and large inheritances; (2) the so-called Social Security Act (August 14), intended to establish an old-age pension system and an unemployment insurance system with heavy taxes extorted from the business public by impositions upon payrolls; and (3) an extensive revision of the banking law which although finally greatly reduced in its scope, nevertheless introduced some very far-reaching alterations. To these should probably be added, as important but not so fundamental, the act (August 26) disestablishing the public utilities holding companies—a process directed to begin on December 1 at the hands of the Securities Exchange Commission. These factors undoubtedly operated as retarding elements against the process of recovery; yet, insufficient to cancel the constructive factors furnished in the defeat of the "NRA" and

the ending of the controversy about the standard of value for the time being. Altogether, the condition of manufacturing and production generally was the best for the year as a whole that had been experienced since the pre-panic period. In the following table a composite index of industrial production, compiled and published by the Federal Reserve Board, has been reproduced in brief.

Distribution. Ever since the beginning of the depression, the first care of the public authorities had been to stimulate the distribution of goods, both for the sake of the unemployed consumers and as a means of maintaining the structure of trade the country over. This situation was continued during the year 1935 as a result of the large distributions of Federal aid or "relief," as well as of the gradual introduction of a new system of "works relief" supported by congressional appropriation of \$4,800,000,000, to be used as the President might see fit. The expenditure of these sums and the natural tendencies to recovery, origi-

^a Based throughout on figures of daily average sales—with allowance for changes from month to month in number of Saturdays and for six national holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas. Adjustment for seasonal variation makes allowance in March and April for the effects upon sales of changes in the date of Easter.

nating with the fact that preceding years had made some necessary readjustments of the basis of prices, tended to keep demand good up to the end of the autumn season, while the influence of improving dividends and rather better employment situation, combined with Federal expenditures, helped to make the end-of-the-year trade preceding the holidays the best that had been experienced for a number of seasons. As in preceding years, it was true that the growth in volume was preponderantly in the cheaper type of goods and that there was a lack of uniformity in rates of improvement throughout the country. Foreign demand was especially unsatisfactory until toward the close of the year, when imminent danger of war in Europe brought an artificial improvement in export figures as regards staples, resulting in a total volume of export trade approximately equal to that of 1934.

Commodity Prices. More than ever, during the year 1935, did the official efforts to further what was called "inflation" continue to be disappointing. While the gains in prices that had taken place during 1933 and 1934 were not very marked, they had, at any rate, amounted to something, even when full allowance had been made for the purely political advances brought about through reducing acreage and introducing scarcity prices for agricultural products. The year 1935 had not altered this situation materially, but a composite index of prices for the year (Bureau of Labor) continued in the neighborhood of 80, with a low point of about 79 at the beginning of the year and a high point of 81 at the end. The accompanying table reflects the official figures for movements of wholesale prices as compiled by the U.S. Bureau of Labor Statistics.

MOVEMENT OF WHOLESALE PRICES

Month	1929	1930	1931	1932	1933	1934	1935
January	97.2	93.0	77.0	67.3	61.0	72.0	79.0

November	94.4	80.4	68.3	63.9	71.0	77.0	81.0
December	94.2	78.4	66.3	62.6	71.0	77.0	81.0

Manufacturing. As has already been observed, notable improvement in manufacturing developed during the year 1935. Undoubtedly there is a widespread impression that this gain was the immediate consequence of changes in Federal policy which grew out of a Supreme Court decision adverse to the National Recovery Administration. Contemporary opinion is to the effect that the announcement of the adverse view of the Court was immediately followed by resumption of activity on the part of many enterprises which had previously been depressed because of lack of confidence in the future. Whatever truth there may be in this interpretation, it must also be borne in mind that the condition of shortage which had been produced in many industries by reduction of output during preceding years and of "backed up" demand which had been growing greater and greater, had eventually overflowed in a vigorous call for commodities. This led to the broadening of output to which reference has already been made. And yet, it should also be noted, the increase in industrial production, so much talked about, was not after all greater than had occurred in various former years. The Reserve Board's

average for total industrial output in 1933 was 76, in 1934, 79, and for the year 1935 was about 90; an enlargement therefore of over ten points above the level of the preceding year.

The fact that the growth in industrial production was not phenomenal, is attested by the circumstance that unemployment continued to be heavy and was estimated by the American Federation of Labor about the end of the year, as in the neighborhood of about twelve millions,—an increase over the figures the same organization had previously made public. The Industrial Conference Board, at about the same date, estimated unemployment at something like two million persons less than the Federation of Labor. Their estimates show that the reduction in unemployment which had taken place during the year was only a small part of the total. President Roosevelt had estimated the total reduction in November as something like 3,500,000 and the American Federation of Labor practically concurred in this estimate, but in order to do so, found it necessary to raise its estimates of peak unemployment very much above what they had ever been before. The unemployment existing at the end of the year, whatever it was, was large, and the amount of reduction in it, according to all estimators, was but a small fraction of the aggregate. It was particularly severe in the so-called heavy industries, as in preceding years, notwithstanding gradual improvement of the conditions in these industries. The monthly figures of the United States Steel Corporation furnish a rough index of the position in the heavy industries, and were as follows:

U. S. STEEL CORPORATION SHIPMENTS (TONS)

Month	1935	1934	1933	1932
January ...	534,055	331,777	285,138	426,271

Agriculture. Following upon the unfavorable year 1934 in which the country suffered heavily from drought, the early months of 1935 seemed to be on the point of repeating the experience of the twelvemonth earlier. The same dust storms in the Southwest, the same early drought damaging winter wheat and other grains, and the same general unstableness in many parts of the country produced the gloomiest forebodings. These fears were put to rout before spring had ended, and early summer found excellent growing conditions prevalent in nearly all parts of the country. The effect of the early drought persisted in some regions but these were fairly narrowly circumscribed and as the year advanced it turned out that very substantial output was to be expected in most grains, in cotton, and in a large number of the "minor crops," fruit produce, etc. Prices, on the other hand, were from the beginning firm, partly due to the reduction of acreage and destruction of animals that had been carried on during the preceding year—a policy whose continuance was announced early in 1935.

The reaction of prices which some had expected

as a result of improvement in output in the latter part of the season was partly offset by an increase of foreign demand, perhaps growing out of the existence of war preparations in different parts of the world. Increases in prices of notable character took place in many essential foodstuffs, while staple materials of manufacture also gained ground quite decidedly. Despite the fact that the government reduced its basis of lending on cotton from 12 cents per pound to 10 cents—although with an additional 2 cents bonus payable under certain guarded conditions, cotton prices did not fall very materially, but maintained themselves. The closing price of wheat (No. 2 red) in New York was \$1.17½ per bushel at the end of the year, while cotton (middling upland) closed at 12.10 cents per pound. The actual gross income of farmers for the year was reported as follows by the U.S. Department of Agriculture:

GROSS INCOME FROM FARM PRODUCTION

[In millions of dollars]

Source of Income	1932	1934	1935*
Crops:			
Grains	452	536	700

General Business. Improvements in industrial earnings had begun in 1934. The first quarter of 1935 depicted a further advance while in subsequent quarters these gains began to show themselves in larger distributions of dividends. Not a few concerns which had previously suspended dividends now resumed them and others which had been satisfied with a curtailment announced an enlargement of the distributions. Some enterprises which had been habitually keeping up their dividends and paying them out of surpluses, found it possible to earn an amount equal to their disbursements. This improvement would have been a good deal faster and larger had it not been for the increasing weight of taxation which resulted in enlarging the expenses of production for nearly every kind of business. Concerns that suffered particularly from this enlargement of costs were the railroads and public utility enterprises, especially the former, which even while enlarging their gross incomes often found their net incomes declining. On the other hand, various enterprises, alarmed by the hostile attitude of Congress toward accumulated earnings and savings, became much more disposed to distribute surplus earnings instead of keeping them available as balances on their books. Thus, some part of the enlargement of dividends which occurred during 1935 must be reckoned as artificial.

Business Failures. Notwithstanding several important receiverships which were announced among the railroads and larger industrial concerns during 1935, the general situation as to business failures showed distinct improvement. Not only

were failures fewer in number, but they were less serious in losses. It continued to be true that the working of the national bankruptcy law of 1932 cut off many failures that would otherwise have occurred and led to the labeling of many a collapse as a "reorganization" which in other circumstances would have been a receivership or an ordinary failure. The increase in activity and in output which was occurring, however, enabled many concerns to make an unexpectedly good showing, and this reacted upon the statistical position. Banks conspicuously which had suffered so severely during preceding years were now able to show a change which greatly reduced the failure ratio, owing to the fact that the weaker institutions had already gone to the wall. The failure compilations furnished by Dun and Bradstreet afford a further view of this situation as follows:

TOTAL NUMBER OF COMMERCIAL FAILURES IN THE UNITED STATES, WITH LIABILITIES, FOR FOURTEEN YEARS, AS REPORTED TO DUN AND BRADSTREET, INC

Year	Number	Liabilities	Average
1935	11,879	\$230,120,886	\$19,372
1934	12,185	264,248,176	21,686
1933	20,307	502,830,584	24,761
1932	31,822	928,312,517	29,172
1931	28,285	736,309,102	26,032
1930	26,355	668,283,842	25,357
1929	22,909	483,250,196	21,094
1928	23,842	489,559,624	20,533
1927	23,146	520,104,268	22,471

1922	23,676	624,896,251	26,351
1921	19,652	627,401,883	31,926

BUTTERFIELD, KENYON LEECH. An American agriculturist and college president, died at Amherst, Mass., Nov. 25, 1935. He was born at Lapeer, Mich., June 11, 1868, and in 1891 graduated from Michigan State College and accepted the position of assistant secretary there. From 1892 to 1895 he edited the *Michigan Grange Visitor*, and was editor of the Grange Department of the *Michigan Farmer* from 1896-1903. During that time he was college field agent at Michigan State College (1896-99), and from 1895 to 1899 was superintendent of the Michigan Farmers' Institute. In 1902 he lectured on rural sociology at the College.

Invited to the presidency of the Rhode Island College of Agricultural and Mechanical Arts he accepted and served also as professor of political economy and rural sociology there from 1903 to 1906, when he was offered and accepted the presidency of Massachusetts Agricultural College at Amherst. For 18 years he served in this capacity, and under his able administration the College made such progress that the student body was trebled and the campus increased by 300 acres. In 1909 he acted as Carew lecturer at the Hartford Theological Seminary. From Massachusetts he was called to Michigan State College as president in 1924, and resigned four years later to become counsellor on rural work for the International Missionary Council, which made studies of rural missions in the Far East, particularly in India.

Always interested in the subject of rural sociology, Dr. Butterfield was appointed to the Country Life Commission by President Theodore Roosevelt in 1908. Personal experiences and his experiences while serving on this Commission led him to organize the first National Country Life Conference at Baltimore, Md., Jan. 6-7, 1919, the success of which led to the formation of the American Country

Life Association. In 1917, the Young Men's Christian Association sent him to France to take charge of their educational programme, which, after the War, was taken over by the United States Government. He remained with the Commission until 1919, and while in France aided in founding the World Agriculture Society, of which he served as president.

A member of many commissions, Butterfield served on the American Commission to Study Rural Credit in Europe (1913); the China Education Commission sent by the Foreign Mission Boards of America, for which he wrote a special report on agricultural education in China (1921); and was chairman of the groups studying New England's food supply and marketing problems (1922). Also, he was president of the American Country Life Association, and later, its honorary president.

Dr. Butterfield was the author of *Chapters in Rural Progress* (1908); *The Country Church and the Rural Problem* (1911); *The Farmer and the New Day* (1919); *A Christian Program for the Rural Community* (1923).

BYNG, bing, JULIAN (HEDWORTH GEORGE), BYNG, FIRST VISCOUNT, OF VIMY, OF THORPE-LE-SOKEN. A British Field-Marshal who died at Thorpe-le-Soken, Essex, England, June 6, 1935. Born in England on Sept. 11, 1862, he was educated at Eton, and in 1883 joined the 10th Royal Hussars as a subaltern. At this time he became deeply interested in military tactics and devoted his leisure to the study of the development and application of modern invention and science as it affected the conduct of war. He was stationed for a time at Lucknow, India, but saw his first active service in the Sudan (including El Teb and Tamai) in 1884, and received a medal with clasp and the Khedive's Star for bravery. Passing through the Staff College in England, he became a major in 1898, and organized, November, 1900, the South African Light Horse, composed of hardy colonials, for service in the South African War. Here he won reputation for discipline, and in 1901 was promoted to the rank of colonel and received the Queen's Medal with six clasps, and the King's Medal, and membership in the Royal Victorian Order in 1902.

After holding various cavalry commands, and being promoted to major-general, he was appointed general officer commanding the army in Egypt from 1912-14. When the World War broke out he was ordered home to take the Third Cavalry Division to France, where they landed in October, 1914. Together with the Seventh Cavalry Division, under General Rawlinson, they covered the Belgian retreat from Antwerp to Ypres. Later, they formed a part of General Allenby's forces that held the southern half of the salient during the first battle of Ypres. In May of 1915, Byng succeeded Allenby as head of the cavalry and fought the second battle of Ypres. In that summer he was sent to the Dardanelles in command of the 9th Corps, and remained there until the withdrawal of that fateful expedition. His masterly command of the bloodless evacuation of the Suvla area on Dec. 18-19, 1915, earned for him promotion to lieutenant-general, and he was created a Knight Commander of St. Michael and St. George, and in the following year, a Knight Commander of the Bath.

Shortly before the Somme offensive in May of 1916, Byng was called back to the Western Front to command the Canadian Army Corps. This Corps formed part of the Fifth Army under Sir Hubert Gough. In the fall of the year, the Canadians were

moved north to the neighborhood of Vimy Ridge as part of the Third Army. In the spring of 1917, the Third Army, under General Allenby, opened an offensive on the Arras sector, and on April 6, the Canadians, under General Byng, began the storming of Vimy Ridge. Under adverse weather conditions, the Canadians began their onslaught and succeeded on the first day in reaching Hill 145. The following day they were successful in capturing the Hill, giving to the Allied cause the once impregnable Vimy Ridge. As a result of the battle, about 4000 prisoners were taken, together with much artillery, and the German position in the French industrial sections was made precarious. In recognition of his services here, the General was given command of the Third Army.

The surprise element in attack had been largely discontinued, but in the fall of 1917, the British decided to combine the surprise element with the use of tanks on a large scale. This plan was entrusted to General Byng and the Third Army, and on Nov. 20, 1917, the attack, led by almost 400 tanks, got under way, and the enemy's line was penetrated far deeper, and at less cost than heretofore. This attack was said to be "the most sensational and dramatic episode of the year's fighting." It served to show how trench deadlock could be broken by the use of tanks, and the experience was put to good use in breaking the Hindenburg line a year later.

Byng was made a full general in November, 1917, and after the War, in 1919, the title of Baron Byng of Vimy was conferred upon him. In addition he received the thanks of Parliament, and a grant of £30,000. He was made a Knight Grand Cross of the Bath and received decorations from many nations, including the Distinguished Service Medal of the United States. In 1921, General Byng, who had retired to the army reserve list, was appointed Governor-General of Canada, and made a Knight Grand Cross of St. Michael and St. George. He served as Governor-General for five years, and during his administration he precipitated a constitutional crisis in the Dominion that resulted in the establishment of the principle that the Crown, in the person of the Governor-General, could not refuse a dissolution of Parliament asked for by a Prime Minister. This was brought about by Byng's refusal in 1926 to accede to the request of William L. Mackenzie King, the Prime Minister (Liberal), to dissolve Parliament. An election had recently been held but no party had received a majority, so Lord Byng felt it would be disturbing to have a second election within a year, inasmuch as Arthur Meighen (Conservative) was the leader of the most numerous party in Parliament, and thought he could command a majority, it was but fair to call him to office. Mr. King challenged the Governor-General's right to refuse the advice of the Prime Minister to dissolve. Shortly after taking office as Prime Minister, Mr. Meighen was defeated and Parliament was dissolved, which led to the 1926 elections and Mr. King was returned to office. Upon the completion of his term as Governor-General, Lord Byng was offered a re-appointment, which he refused. In 1926 he was raised to the rank of Viscount.

Two years later, he accepted the appointment of Commissioner of the Metropolitan Police of London. He held this office for three years, during which time he reorganized the department and raised the morale of its members. In 1932 he was made a Field-Marshal. In 1902 he married Lady

Marie Evelyn Moreton, the author of *Barriers* (1912) and *Anne of the Marshland* (1913).

Mineral Production. More petroleum was produced in the State in 1934, the year's total rising to 175,509,000 barrels, from 172,010,000 for 1933. Except for a minor quantity exported from the country, all the product of 1934 was refined in the State. Closely related to the production of petroleum, that of natural gas increased to 281,354,800 M cu ft for 1934, from 270,059,500 M cu ft. for 1933. No great addition to the underground reserve of petroleum was made in 1934, but new fields producing mainly gas, the Edison in Kern county and the Kettleman Hills Middle Dome, were developed. Of the gas produced in 1934, nearly 60 per cent was sold to public utilities and other consumers, and nearly 17 per cent was used in the production of gasoline. In 1934 were produced 498,200,000 gallons of gasoline derived from natural gas.

The rise in the mines' yearly production of gold, which had followed the depreciation of the dollar, continued. It lifted the annual output to 869,400 fine ounces of the metal (1935), from 719,064 (1934). By value, the totals were \$30,429,000 (1935, at \$35 an ounce) and \$25,131,284 (1934, at an estimated average price of \$34.95 an ounce). Of the year's production of gold (1935), 51 per cent came from 39 enterprises operating lode mines; 29 per cent, from 27 dredging enterprises.

Education. For the academic year 1934-35, the enrollments of pupils in the public schools throughout the State totaled 1,412,239. They were thus distributed: in kindergartens, 63,743; in elementary grades and high-school grades through the eighth, 767,752; in high schools and junior college courses, 580,744. The expenditures of the year for

public-school education totaled \$125,847,571; of this sum, \$64,950,987 was expended on elementary schools and \$60,896,584 on high schools. For the year previous, the annual salaries of full-time teachers averaged \$1632 in the kindergartens, \$1643 in the elementary grades, and \$2182 in the high-school grades, those of the junior high schools included. Buildings were supplied in 1935 to many schools that had been held in tents or temporary premises. Though the State was handicapped by a deficit, all public schools were able to carry on their regular programmes. The movement to remould the curriculum to fit "social needs" was active in the State.

Charities and Corrections. In 1935 the Department of Social Welfare was the State of California's central administrative authority in matters of the care or custody of persons. It had as executive head a Director, appointed by the Governor. A board of six members, also holding by appointment, gave deliberative consideration to the departmental problems. The Department examined and reported on the operation of the charitable and correctional institutions of the State, the counties and the cities and on the working of probation for offenders, it managed the State's grants of aid to the needy aged, to the blind, and to children who lacked support; it inspected and licensed all boarding homes and institutions for children and the aged, and advised the courts as to all applications to adopt children.

As reported on September 21, 877 persons over 65 years of age were receiving aid to the needy aged at an average of \$10.07 a month to each from the State and an equal amount from the counties. Blind persons, 3644 in number, were getting an average of \$16.58 a month from the State and the like from the counties. Dependent children, orphans included, were receiving, to the number of 18,999, monthly support from the State at the rate of \$10 a month to the child, which counties might supplement as they chose.

Legislation. New taxes were imposed and old taxes increased in order to meet an estimated \$93,000,000, for the ensuing two years, of expenditure in excess of revenue. The enactment of a tax on chain stores compelled each company to pay \$500 a year on every store that it operated in excess of nine. A proposal to increase the sales tax to the rate of 3 per cent, from 2½, was carried, despite strong opposition. The inheritance tax was increased, so were taxes upon banks and franchises. A new system for the taxation of automobiles was created.

Regarding pensions for old people, the Legislature, like the Governor, showed strong sympathy with the Townsend proposal for high pensions (\$200 a month). It passed a resolution requesting the Federal Congress to enact the Townsend plan; but in dealing with the State's own pensions for the aged it contented itself with increasing payments to \$35 a month (from \$30) as a maximum and setting a minimum of \$20 a month, the qualifying age being 65 years. There was enacted a law to create a system of compensation for unemployed persons, in accordance with the Federal Social Security Act. New facilities for mortgaged owners of property, in dealing with creditors, were given by an act prolonging in altered form the expiring moratorium on mortgages: power was given the courts to determine, in proceedings as to mortgages, how little the owner need pay, in addition to taxes and insurance, to retain the use of the mortgaged property.

A law of 1927 requiring three days' notice as a prerequisite to marriage was repealed as having impelled persons to be married outside of the State. The Legislature made a trial, during the session, of voting on measures by use of a voting machine; it was said to save time that would have been taken up by the older methods, but there were hints that votes had been cast for absent members by friends or colleagues.

Political and Other Events. The operation of the State's newly enacted tax on chain stores was prevented by the signing of petitions in sufficient number to call for the submission of the law to a referendum to be held at the next general election (November, 1936). In the meanwhile the law was to remain in abeyance. The State Director of Social Welfare adopted as to the administration of the new law for pensions to the aged the policy of according such pensions only in amounts determined to be needed. Thus it was hoped to reduce materially the estimated charge of \$17,000,000 a year for this form of aid. The State Board of Equalization was reported to have decided to take into its own control the enforcement of laws as to the liquor traffic.

The State Supreme Court affirmed on appeal the validity of a sentence of death upon Tanner and Brooks, who had seized a victim in 1933 and tortured him to obtain money. The State brought suit in the Federal courts on August 18 to recover a sum representing processing taxes on goods bought as supplies for State institutions.

The EPIC movement headed by Upton Sinclair lost ground: it failed to obtain a majority in the city council of Los Angeles in the spring elections; a convention of the EPIC group at Los Angeles on May 18 developed sharp differences with radicals declared by Sinclair to be Communists; Sinclair withdrew from leadership on August 1 and was succeeded by State Senator Culbert L. Olson.

The movement for a Federal grant of pensions to the elderly at \$200 a month, started in California by Dr. F. E. Townsend, made headway there and in other States. Townsend, supported by a convention of representatives of 5000 clubs of his followers from many States, declared, on Dec. 12, 1935, his intention to put into the election of 1936 candidates for the National offices and for all the open places in Congress. See OLD AGE PENSIONS under *Townsend Plan*.

The Federal Supreme Court by an order of January 21, dealing with an appeal of Thomas J. Mooney (life prisoner convicted of murder for participation in the San Francisco bombing of 1916), sent the case back to the State Supreme Court. There he obtained a writ of habeas corpus, which led to a series of hearings before a referee. Mooney's counsel adduced much evidence purporting to discredit the testimony of F. C. Oxman and other witnesses for the original prosecution.

Work on the San Francisco Bay Bridge, under construction, was sufficiently ahead of schedule to permit the announcement in October that the bridge would probably be open for automobiles in November, 1936. As to the Golden Gate Bridge, construction was stated to be 52 per cent accomplished. The sale of electricity from the Hetch Hetchy development by the city of San Francisco to the Pacific Gas and Electric Company was condemned in a ruling of the Federal Secretary of the Interior, given out on August 26. He declared that sale of electricity to the company was against the purpose of the Baker Act of 1913 granting the city the right to use water from the Tuolumne River.

Officers. The chief officers of the State, serving in 1935, were: Governor, Frank F. Merriam; Lieutenant-Governor, George J. Hatfield; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Superintendent of Public Instruction, Vierling Kersey.

Judiciary. Supreme Court: Chief Justice, William H. Wasté; Associate Justices, William H. Langdon, N. P. Conrey, Jesse W. Curtis, Emmet Seawell, John W. Shenk, Ira F. Thompson.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher learning with headquarters at Berkeley, Calif., founded in 1868. Branches are found in various parts of the State. At Mt. Hamilton is the Lick Observatory; at San Francisco, the California School of Fine Arts, Hastings College of the Law, Medical School, the George William Hooper Foundation for Medical Research, College of Dentistry, College of Pharmacy; at Los Angeles, the University of California at Los Angeles, Branch of the College of Agriculture in Southern California, the Los Angeles Medical Department; at Davis, Branch of the College of Agriculture; at Riverside, Branch of the College of Agriculture in Southern California, including the Citrus Experiment Station and the Graduate School of Tropical Agriculture; at La Jolla, the Scripps Institution of Oceanography.

The total number of resident students in the academic and professional departments, fall and spring sessions, 1934-35, was 21,125, of whom 12,227 were men and 8898 were women. At Berkeley 13,218 students were enrolled; at Los Angeles 6863. The enrollment in the University Extension Division in 1934-35 was 36,884 in classes and correspondence courses. The 1935 summer session enrollment (Berkeley and Los Angeles) totaled 4157. At the beginning of the autumn term there were approximately 2000 members on the regular teaching staff and 600 on the extension staffs. The total income for 1934-35 was \$13,061,400, including gifts totaling \$129,000 for permanent improvements, \$1,088,000 for endowments, and \$355,000 for current use. Total assets were listed at \$76,415,000, including \$49,860,000 in real estate, improvements and equipment, and \$20,585,000 in endowment and trust funds. The libraries contained approximately 1,217,000 volumes. President, Robert Gordon Sproul, LL.D.

CALIFORNIA INSTITUTE OF TECHNOLOGY. An institution for collegiate and graduate instruction and research in the pure and applied sciences in Pasadena, Calif., founded as Throop Polytechnic Institute in 1891. The enrollment for 1935-36 was 820, of whom 572 were in the undergraduate and 248 in the graduate school. The faculty numbered about 200. The endowment was approximately \$8,000,000, and the annual income approximately \$750,000. There were 40,000 volumes in the library. The institute has no president, the administration centering in an executive council of eight, of which Robert A. Millikan, Ph.D., LL.D., Sc.D., is chairman.

CAMBODIA. See FRENCH INDO-CHINA.

CAMBON, kan'bôn', JULES MARTIN. A French diplomat, died at Vevey, Switzerland, Sept. 19, 1935. He was born in Paris, Apr. 5, 1845, and at the lycée Louis-le-Grand was educated for the law, which he began to practice in 1866, becoming known for his forensic ability. When the Franco-Prussian War began, Cambon was secretary of the Lawyers Conference but joined a mobile unit in the Seine-et-Marne Department as a captain.

At the close of the war he joined the civil service, serving first as auditor of the provisional commission appointed in 1871 to replace the Council of State. Three years later he was appointed an attaché to the Governor-General of Algeria, and became Prefect of Constantine in 1878. Subsequently he returned to France and was Prefect of the Department of the Nord, 1882, and of the Department of Rhodé, 1887-91. In the latter year he was appointed Governor-General of Algeria, and served in that capacity until he was appointed Ambassador to the United States in 1897.

At the close of the Spanish-American War, M. Cambon acted as representative of the Spanish crown and signed the agreement of Aug. 9, 1898, in the name of the Spanish Government, which ended the rule of Spain in America. The prestige he gained by his diplomacy and adroitness led to the establishment of the Washington Embassy as fourth in international rating. He was made a Commander of the Legion of Honor in 1899.

In 1901, he was transferred to Madrid, and in 1906, during the Moroccan dispute, he was instrumental in encouraging England to take a definite stand in the matter. When he was sent to Berlin in 1907, his reputation in this affair preceded him. While at this post he distinguished himself by tiding over the Agadir crisis of 1911. He remained in Berlin until the outbreak of the World War when he resigned from the diplomatic service.

Because of his familiarity with German affairs, his knowledge was of benefit to his country at the outbreak of the War, and in 1915 he received the appointment of General Secretary for Foreign Affairs and in 1918, that of Councillor for the affairs of Alsace-Lorraine. He was elected to the French Academy in this same year. He served on the committee that received the German delegates who were to sign the Treaty of Versailles and also on the commission which arranged the Polish corridor. In addition, he was one of the signers for France of the Treaty of Versailles. From 1920 to 1922 he was president of the Council of Ambassadors, which succeeded the Peace Conference.

Although he never wrote of his long diplomatic experiences in the form of memoirs, M. Cambon contributed to many newspapers, including *The New York Times*, *Les Annales*, and *L'Esprit International*. These articles were at various times made into booklets, the last of which appeared in 1931. It was translated into English and published under the title, *Old and New Diplomacy*. Also, he contributed a review of the *Memoirs* of Prince von Bulow to *La Revue des Deux Mondes* in 1931; the article "Security" to the *Encyclopædia Britannica* (14th ed.); and an article, "The Foreign Policy of France" to *Foreign Affairs*, January, 1930. He revised annually, *Le Diplomate*, a handbook used by Foreign Office recruits. He was known as one of the most resourceful, tactful, persuasive, and modest of the diplomats ever in the service of the Third French Republic.

CAMEROON, kām'er-ōon', FRENCH. An autonomous territory, formerly part of the German territory of Kamerun, confirmed as a French mandate by the League of Nations in 1922. Area, 166,489 sq. miles; population (1933), 2,298,495 of whom 2038 were Europeans. Yaoundé, the capital, had 6190 inhabitants. In the 141 schools during 1933 there were 16,089 pupils; in addition there were 5 professional schools and a school for the sons of native chiefs.

Production and Trade. The principal products were groundnuts, cacao, palm oil, almonds, hides,

timber, and ivory. In 1933, imports were valued at 75,263,000 francs; exports, 77,562,000 francs.

Government. The general budget for 1933 indicated 57,291,141 francs for revenue and 54,464,719 francs for expenditure. Government was vested in a commissioner aided by an administrative council. Commissioner in 1935, M. Repiquet.

CAMEROONS, kām'ēr-ōōns', BRITISH. The part of the former German territory of Kamerun in West Africa, confirmed as a British mandate by the League of Nations in 1922. Area, 34,559 sq. miles; population, 781,115. Victoria and Tiko were the two ports of entry.

Production and Trade. Cacao, palm oil, palm kernels, rubber, bananas, timber, and guinea corn were the main products. In 1934, imports of general cargo were valued at £110,069; exports of general cargo, £194,012.

Government. For 1933-34, revenue amounted to £91,336; expenditure, £120,067. The northern part of Cameroons was attached to the Nigerian Provinces of Adamawa, Benne, and Bornu; the southern part, known as Cameroons Province, was attached to the Southern Provinces of Nigeria. Administration was under the governor of Nigeria. See NIGERIA

CAMP FIRE GIRLS OF AMERICA. An organization primarily for the adolescent girl, whose object is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." It was organized nationally in 1911 and chartered in 1912, with Dr. Luther H. Gulick as president. The purpose of its activities is not the attainment of particular skill in any of the seven crafts, home, health, hand, camp, nature lore, business, and citizenship, but the development, and happiness through development, of the individual girl, who discovers new interests and new talents and at the same time enjoys the companionship of other girls. The membership of the organization in 1934 was 228,744, including 183,804 Camp Fire Girls and Guardians and 44,940 Blue Birds, the youngest members.

Each year the organization promotes a special project, emphasizing different phases of its aims and activities. The theme of the project for 1935 was "My Place in the World," the girls engaging in activities which brought them a realization of their place as citizens at home, in their own towns, in the United States and in the World. They made maps and collections of photographs of their towns and models of certain areas as they are and as they might be improved. They arranged programmes showing the history of their towns and other programmes showing the dependence of nations, one upon the other. The groups of older girls in the larger cities accepted a "Challenge" from Mrs. Franklin D. Roosevelt to find out about the work possibilities and living conditions in their towns. Their reports were read by a committee composed of Mrs. Roosevelt, Dr. Henry Overstreet, head of the Department of Philosophy of the College of the City of New York (and author of "We Move in New Directions" as well as numerous other books), and Lester F. Scott, National Executive of the Camp Fire Girls. The four groups whose work was judged the most outstanding by this committee were given letters of commendation by Mrs. Roosevelt at a little ceremony held at the National office.

The organization publishes *The Guardian*, a programme resource for leaders. The national officers in 1935 were: Mrs. Lida Foote Tarr, president; Miss Florence Hughes, first vice-president;

Dr. Joseph E. Raycroft, second vice-president; Dr. Jay B. Nash, third vice-president; Mr. Edgar Webb, treasurer; and Lester F. Scott, secretary and national executive. National headquarters are at 41 Union Square, New York City.

CANADA. A Dominion of the British Commonwealth comprising nine Provinces and two Territories. Capital, Ottawa.

Area and Population. The land area, the census population of June 1, 1931, and the estimated population on June 1, 1935, are shown by Provinces and Territories in the accompanying table, compiled from the *Canada Year Book, 1934-35*. The fresh water area is about 228,070 square miles, making the total land and water area 3,694,836 sq. miles.

AREA AND POPULATION OF CANADA

Province	Land area, sq miles	Population 1931	1935
Prince Edward Island ..	2,184	88,038	89,000
Nova Scotia	20,743	512,846	527,000
New Brunswick	27,710	408,219	429,000
Quebec	523,534	2,874,255	3,062,000
Ontario	363,282	3,431,683	3,596,000
Manitoba	219,723	700,139	739,000
Saskatchewan	237,975	921,785	978,000
Alberta	248,800	731,605	780,000
British Columbia	359,279	694,261	735,000
Yukon Territory	205,146	4,230	4,000
Northwest Territories	1,258,217	9,723	10,000
Total	3,466,793	10,376,786	10,949,000

The 1931 census showed 5,374,541 males and 5,002,245 females, the excess of 3.59 males over females in each 100 of population being exceeded only in Argentina. Of the 1931 population, 5,381,071 were of British origin (English, 2,741,419; Scottish, 1,346,350; Irish, 1,230,808; other, 62,494) and 2,927,990 of French origin. The population was divided by religious affiliation as follows: Roman Catholics, including 186,654 Greek Catholics, 41.30 per cent; United Church (Methodists, Congregationalists and Presbyterians), 19.44 per cent; Anglicans, 15.76 per cent; Presbyterians (not included in United Church), 8.39 per cent; Baptists, 4.27 per cent; Lutherans, 3.8 per cent; Jews, 1.5 per cent. Populations of the chief cities in 1931 were: Montreal, 818,577; Toronto, 631,207; Vancouver, 246,593; Winnipeg, 218,785; Hamilton, 155,547; Quebec, 130,594; Ottawa, 126,872; Calgary, 83,761; Edmonton, 79,197; London, 71,148; Windsor, 63,108; Verdun, 60,745; Halifax, 59,275; Regina, 53,209; Saint John (N.B.), 47,514; Saskatoon, 43,291. Including suburbs, Montreal had 1,000,157 inhabitants; Toronto, 808,864; Vancouver, 308,340; Winnipeg, 280,202. The so-called Border Cities (Windsor, East Windsor, Walkerville, and Sandwich) were amalgamated in 1935.

Immigrants into Canada during the fiscal year ended Mar. 31, 1935, totaled 12,126, including 2198 from the United Kingdom, 5960 from the United States, and 3978 from other countries. During the same period 7618 Canadian citizens returned from the United States. Live births in 1934 numbered 220,928 (222,868 in 1933); deaths, 101,502 (101,968 in 1933); marriages, 73,074 (63,865 in 1933). The 1934 birth rate per 1000 of population was 20.4. The number of illegitimate births, 8031, was 3.64 per cent of all living births.

Education. The 1931 census revealed an illiteracy rate of 7.8 per cent among the population over five years of age. In 1933 there were 32,708 educational institutions of all kinds, with 2,530,056 pupils and 84,381 teachers and with budget expenditures aggregating \$146,921,862. Ordinary and

technical day schools controlled by the provinces numbered 30,800, with 2,232,622 pupils. There were 1035 privately controlled ordinary day and business training schools, with 102,791 pupils; and 152 institutions of university grade, with 41,175 students; besides various special schools. Educational expenditure of all forms declined from a peak of \$178,700,000 in 1931 to about \$130,000,000 in 1934.

Production. The value of all Canadian production in 1933 was estimated by the Dominion Bureau of Statistics at \$3,375,542,000 gross and \$2,062,311,000 net. The gross production of primary industries was valued at \$1,556,633,000 and the net value was \$1,093,750,000; for secondary industries, the gross value of production was \$2,256,324,000 and the net value \$1,234,468,000. Elimination of duplications account for the fact that the grand total figures are less than the sum of the primary and secondary values. The gross value of primary industries was made up as follows: Agriculture, \$890,164,000; forestry, \$197,325,000; fisheries, \$35,736,000; trapping \$7,258,000; mining, \$264,737,000; and electric power, \$161,411,000. Of the secondary industries, construction accounted for a gross value of \$97,289,000; custom and repair work, \$72,186,000; manufactures, \$2,086,847,000.

The population gainfully employed in 1931 numbered 3,927,591, or 48.1 per cent of the total; of the male working population approximately 34 per cent were engaged in agriculture, 11 per cent in manufacturing, 7.6 per cent in transportation, and 6.2 per cent in building and construction. The *Financial Post*, Toronto, estimated the national income in 1935 at \$4,086,000,000, against \$3,838,000,000 in 1934.

Agriculture. According to the 1931 census, Canada had 163,114,034 acres of occupied farm land and 189,043,156 acres of potential agricultural land were still available for occupation, excluding the Yukon and Northwest Territories. Grain, dairy products, fruit, livestock, and fur are the chief farm products. The gross agricultural wealth of the nation was estimated at \$5,608,157,000 in 1934 (\$5,563,790,000 in 1933). The estimated gross agricultural revenue declined from \$1,631,081,000 in 1929 to \$766,794,000 in 1932 and then increased to \$802,946,000 in 1933 and \$931,347,000 in 1934. Of the total 1934 gross revenue, field crops accounted for \$544,974,000 (\$453,598,000 in 1933); dairy products, \$181,966,000 (\$170,829,000 in 1933); farm animals, \$99,438,000 (\$89,063,000); poultry and eggs, \$44,267,000 (\$38,060,000); fruits and vegetables, \$39,145,000 (\$33,208,000). Other sources of 1934 revenue were: Tobacco, \$7,232,000; furs, \$4,127,000; maple products, \$3,047,000; wool, \$2,645,000; honey, \$2,245,000; clover and grass seed, \$2,010,000; flax fibre, \$250,000. Yields of the leading field crops in 1932, 1933, and 1934, with preliminary returns for 1935, are shown in the accompanying table.

CANADIAN CROP YIELDS, 1932-35

[Units in thousands of bushels, except as indicated]

	1932	1933	1934 ^a	1935 ^a
Wheat	428,514	281,892	275,849	273,971
Oats	391,561	307,478	321,120	416,369
Barley	80,773	63,359	63,742	87,512
Rye	8,938	4,177	5,423	10,610
Buckwheat	8,424	8,483	8,635	7,972
Mixed grains	39,036	33,009	37,926	39,567
Potatoes	39,416 ^b	47,745 ^b	48,095 ^b	38,786 ^b
Hay and clover ...	13,559 ^c	11,443 ^c	11,174 ^c	14,098 ^c

^a Estimates. ^b 1,000 cwt. ^c 1,000 tons

The total estimated value of the principal Canadian field crops in 1935 was \$510,835,600, a figure

\$38,581,000 or 7 per cent below the 1934 estimate but well above any other year since 1930. Estimated values of the individual crops for 1935, with 1934 figures in parentheses, were: Wheat, \$166,693,000 (\$169,631,000); oats, \$98,298,000 (\$103,124,000); barley, \$23,029,000 (\$29,975,000); rye, \$2,746,000 (\$2,662,000); buckwheat, \$4,096,000 (\$4,572,000); mixed grains, \$14,526,000 (\$15,634,000); potatoes, \$29,782,000 (\$23,822,000); hay and clover, \$109,513,000 (\$131,295,000).

The output of milk in 1934 was 16,295,952,700 pounds; butter, 342,965,500 pounds; cheese, 100,765,800 pounds. Maple sugar production in 1935 was 6,538,960 pounds, valued at \$740,145; maple sirup, 2,250,769 gallons, valued at \$2,782,275. Live-stock on farms in 1934 included 2,933,492 horses, 8,951,900 cattle (including 3,864,200 milch cows), 3,421,100 sheep, and 3,654,000 swine. The number of poultry was 59,798,700 (59,324,400 in 1933). The production of furs in 1933-34 was valued at \$12,122,293. On Dec. 31, 1933, the value of fur-bearing animals on fur farms was \$7,509,567, and the value of pelts sold from fur farms in 1933 was \$3,712,443.

Manufacturing. Canada ranks among the leading world producers of automobiles, hydro-electric power, paper, aluminum, and rubber goods. In 1933 there were 25,232 manufacturing establishments, with an aggregate capital of \$4,689,373,704, and a total of 493,903 employees who received salaries and wages amounting to \$465,562,090. The net value of production was \$1,117,659,273, compared with \$1,997,350,365 in 1929. The industrial lines in which the largest amounts of capital were invested in 1933 were as follows: Central electric stations, \$1,386,000,000; wood and paper, \$893,000,000, iron and its products, \$580,000,000; vegetable products, \$509,000,000. The gross value of production of the chief industrial groups for 1933 was Vegetable products, \$421,849,872; wood and paper, \$342,155,077; textile products, \$294,715,248, animal products, \$271,068,210, iron and its products, \$211,961,908; non-ferrous metals, \$164,765,604, non-metallic minerals, \$141,791,451; central electric stations, \$117,532,081. The wood-pulp and paper industry, the most important single manufacturing industry, exports more than 60 per cent of its output to the United States. Production of newsprint in 1935 was 2,753,289 tons, the largest on record; of pig iron, 600,000 long tons, steel, 936,000 tons; motor vehicles, 139,742 passenger cars and 33,253 trucks.

The output of wood pulp in 1933 was 2,979,562 tons, valued at \$64,114,074; paper, 2,419,420 tons, valued at \$97,030,429 (including 2,021,965 tons of newsprint, valued at \$66,959,501). Production of steel ingots and castings in 1934 was 759,070 tons (409,979 in 1933); pig iron, 406,995 tons (227,317 in 1933); ferro-alloys, 33,085 tons (30,133 in 1933); output of electric power, 21,167,000,000 kilowatt hours; automobiles, by value, \$76,133,000 (\$42,885,000 in 1933). The total capacity of hydro-electric turbine installations in Canada at the beginning of 1935 was 7,547,035 horse power, compared with total potential reserves of 43,700,000 horse power. The general index of industrial production (Base: 1929 equals 100) increased from 58.1 for 1932 to 81.3 for 1935, while the index of industrial employment (Base: 1929 equals 100) rose from 72.5 for 1932 to 80.9 for 1934.

Mineral Production. The value of mineral production in 1934 was \$277,492,263, compared with \$221,495,253 in 1933 and with \$310,850,246 in the peak year 1929. The quantity and value of the principal minerals produced in 1934 were as fol-

lows (figures subject to revision): Gold, 2,969,680 fine oz., \$61,388,732 valued at standard rate (estimated exchange equalization on gold produced, \$41,065,228); coal, 13,795,649 tons, \$41,922,253; nickel, 128,687,340 lb., \$32,139,425; copper, 364,890,860 lb., \$26,681,069; zinc, 298,579,581 lb., \$9,087,568; lead, 346,270,062 lb., \$8,436,524; natural gas, 21,948,855 M cu. ft., \$8,419,073; silver, 16,441,361 fine oz., \$7,803,218; asbestos, 155,980 tons, \$4,936,326; platinum, 116,230 fine oz., \$4,490,763; crude petroleum, 1,417,368 bbl., \$3,558,482; salt, 321,753 tons, \$1,954,953. The output of cement was 3,783,226 bbl., valued at \$5,667,946; of sand and gravel, 13,521,257 tons, \$4,387,281; stone, 3,661,800 tons, \$3,801,000; and lime, 367,317 tons, \$2,752,797.

In 1935 mineral production rose to a value of \$308,164,000. The quantity and value of the most important minerals was: Gold, 3,290,664 fine oz., \$68,024,000; coal, 14,108,718 tons, \$42,499,000; nickel, 139,194,348 lb., \$35,450,000; copper, 418,753,148 lb., \$32,322,000; lead, 337,459,472 lb., \$10,620,000; silver, 16,413,482 fine oz., \$10,346,000; zinc, 316,250,769 lb., \$9,825,000.

Forests. The value of woods operations for 1933 was \$93,773,143, compared with \$92,106,252 in 1932 and with \$219,570,129 in 1929. Of the 1933 total, pulpwood production accounted for \$33,213,973; firewood, \$31,141,104; and logs and bolts, \$23,158,381. Forest operations in 1933 involved the cutting of 2,027,713,767 cu ft of standing timber. Canada's forest resources were estimated at 266,844,000,000 cu ft of standing timber, capable of yielding 448,355,000,000 ft. board measure of sawn lumber and 1,521,938,000 cords of pulpwood, ties, poles, and other materials. The 1933 forest operations provided the equivalent of a full year's work for at least 65,000 men.

Fisheries. According to the advance report of the Dominion Bureau of Statistics for 1934, the production of the fisheries had a total value of \$34,121,971 (\$27,558,053 in 1933). Of the 1934 total, the British Columbia fisheries accounted for \$15,334,335, Nova Scotia for \$7,673,865, and New Brunswick for \$3,679,618. The value of the chief commercial fishes caught in 1934 was Salmon, \$12,875,257; lobsters, \$4,269,764; cod, \$3,327,507; herring, \$1,799,967; whitefish, \$1,358,692; halibut, \$1,133,955; haddock, \$1,075,529; and sardines, \$1,039,002. The capital investment of the Canadian fisheries in 1934, including primary operations and the fish canning and curing industries, totaled \$43,377,531 (\$40,914,057 in 1933) and the industry as a whole gave employment to 83,396 persons, or 3848 more than in the previous year.

The catch of the sea fisheries in 1935 totaled 8,149,350 cwt., valued at \$14,594,070 (unrevised figures).

Tourist Trade. Expenditures of foreign tourists in Canada in 1934 were estimated at \$129,974,000 (\$117,124,000 in 1933 and \$309,379,200 in 1929). Canadian tourists abroad spent \$60,905,000 in 1934, against \$50,860,000 in 1933 and \$121,645,000 in 1929. Automobile tourists from the United States spent \$86,259,000 in 1934 (\$77,250,000 in 1933); rail and steamship tourists from the United States, \$34,260,000 (\$32,111,000 in 1933); and overseas tourists, \$9,455,000 (\$7,763,000). A total of 3,261,848 automobiles entered Canada from the United States in 1934, of which 2,373,648 stayed less than 25 hours. Canadian automobile tourists spent \$32,645,000 in the United States (\$24,611,000 in 1933); rail and steamship tourists, \$13,988,000 (\$12,267,000). Canadian tourist expenditures in

overseas countries were \$14,272,000 (\$13,982,000 in 1933).

Foreign Trade. The marked recovery in Canadian foreign trade inaugurated in 1933-34 was continued in the fiscal year ended Mar. 31, 1935, as indicated by the accompanying table.

CANADIAN FOREIGN TRADE, 1929-30 TO 1934-35
[In thousands of Canadian dollars]

Years ended March 31	Total exports	Imports for consumption	Excess Imports (-) Exports (+)
1929-30	1,144,938	1,248,274	-103,336
1930-31	817,028	906,613	-89,585
1931-32	587,566	578,504	+9,062
1932-33	480,714	406,381	+74,330
1933-34	585,654	433,799	+151,856
1934-35	667,559	522,431	+145,128

The United States in 1934-35 was again the chief source of Canadian imports, supplying 58.1 per cent of the total (54.9 per cent in 1933-34), as against 21.4 per cent imported from the United Kingdom (24.2 in 1933-34). The United States also took 34.1 per cent of Canada's 1934-35 exports (33.5 per cent in 1933-34), while the United Kingdom purchased 41.5 per cent (39.3 per cent in 1933-34). Largely as a result of the Hawley-Smoot tariff passed by the United States Congress in 1930 and the Ottawa Agreements reached in 1932 among the members of the British Commonwealth of Nations, the United Kingdom's share in Canadian imports and exports increased substantially, largely at the expense of the United States, during the period 1930-35.

The leading sources of Canadian imports in 1934-35 were (in 1000 Canadian dollars): United States, \$303,640; United Kingdom, \$111,685; Germany, \$10,014; France, \$6444; British India, \$6413; Australia, \$6327. The principal markets for Canada's domestic exports were (in 1000 Canadian dollars): United Kingdom, \$274,183; United States, \$224,698; Australia, \$18,082; Japan, \$16,936; British South Africa, \$12,656; Belgium, \$11,780; the Netherlands, \$10,072; France, \$9842; New Zealand, \$7345; Newfoundland, \$6469. The 10 leading import commodities, by value, were (1000 dollars): Coal, \$35,618; crude petroleum, \$32,501; automobile parts, \$22,178; machinery, \$19,128; raw cotton, \$18,111; iron plates and sheets, \$15,964; raw sugar, \$14,479; spirits and wines, \$14,351; fresh fruits, \$12,586; books and printed matter, \$9034. The chief export commodities, by value, were (1000 dollars): Wheat, \$132,442; newsprint paper, \$82,148; nickel, \$28,423; wood pulp, \$25,869; planks and boards, \$24,901; meats, \$24,115; fish, \$22,411; automobiles, \$19,192; copper bars, rods, etc., \$18,751; wheat flour, \$18,386.

For the calendar year 1935 imports were \$550,315,000 (Canadian currency) and exports were \$729,294,000 (preliminary figures). United States statistics showed general imports from Canada in 1935 of \$286,220,771 (\$231,695,583 in 1934) and exports to Canada (including reexports) of \$323,190,991 (\$302,433,260 in 1934).

Finance. Dominion revenues for the fiscal year ended Mar. 31, 1935, totaled \$361,872,080, of which \$304,443,729 represented tax revenues. Ordinary expenditures were \$354,368,220, not including extraordinary and capital expenditures of \$123,636,679. In 1933-34 revenues were \$324,480,000; ordinary expenditures \$346,649,000; capital expenditures, \$6,490,000; and special expenditures, \$42,787,000. The budget for 1935-36 estimated total revenues at \$392,100,000 and ordinary expenditures at \$370,600,000.

The net public debt on Mar. 31, 1935, was \$2,846,110,958, or \$116,132,817 higher than on Mar. 31, 1934.

Shipping. During the fiscal year ended Mar. 31, 1935, 116,803 vessels of 86,431,178 register tons entered Canadian ports and 117,203 vessels of 85,976,827 register tons cleared in the sea-going, coastwise, and inland international trade. Arrivals included 21,419 sea-going vessels of 28,512,257 register tons and clearances, 21,784 sea-going vessels of 28,547,591 tons. During the 1934 navigation season a total of 24,261 vessels of 17,736,818 register tons passed through the 10 Canadian canals. They carried 69,990 passengers and 18,069,252 tons of freight.

Railways, etc. The single-track mileage of Canadian steam railways on Jan. 1, 1934, totaled 42,338 miles (42,411 miles on Jan. 1, 1933). For the calendar year 1933 the steam railways operating in Canada reported gross earnings from operation of \$270,278,276 and operating expenditures of \$233,133,108. In the same year they carried 19,172,193 passengers (21,099,582 in 1932), and 63,634,893 tons of freight (67,722,105 in 1932). The privately-owned Canadian Pacific Ry., with 21,941 miles of main line, and the government-owned Canadian National Rys, with 17,018 miles of main line, are the two principal systems, controlling over 90 per cent of the total mileage. From its organization in 1923 to the end of 1934 the Canadian National system accumulated a deficit of \$1,132,067,130, including loans and accrued interest. Railway carloadings in 1935 totaled 2,351,393 against 2,320,050 in 1934. The Canadian National and Canadian Pacific lines showed a gain of about 2 per cent in gross operating revenues over 1934.

The highway mileage on Jan. 1, 1934, totaled 409,124, of which 3033 miles were concrete, 4837 miles macadam, 86,693 miles gravel, and 175,769 miles improved earth. The number of air-mail routes in regular operation increased from 17 to 20 during 1934. A Trans-Canada airway, with complete equipment, including night lighting on 108 intermediate airports, was under construction in 1935.

Government. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry. Legislative power rests in a parliament of two houses—a Senate of 96 members appointed for life by the Governor-General on advice of the Cabinet and a House of Commons of 245 members elected for five years (unless the government is sooner dissolved) by popular male and female suffrage. The nine Provinces enjoy a large measure of local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive. Governor-General in 1935, John Buchan (Lord Tweedsmuir of Elsfield), appointed Mar. 27, 1935, to succeed the Earl of Bessborough. For the 1935 general election, see under *History*.

HISTORY

Political Developments. January of 1935 found the electoral battle to determine the fate of Prime Minister Richard B. Bennett's Conservative government in full swing. The waning prestige of the Conservative party, which had been in control since 1930, had been clearly demonstrated during 1933 and 1934 by repeated Liberal victories in local and provincial elections. The Liberals, overwhelmed by the Conservative landslide of

1930, had regained control of British Columbia and Nova Scotia in 1933 and of Ontario and Saskatchewan in 1934. Confident that his party would be swept back into office on the mounting wave of anti-Conservatism, the astute leader of the Liberals, W. L. Mackenzie King, made little effort to put forward a positive programme for the solution of Canada's problems.

In addition to the usual hostility accruing to depression governments, Mackenzie King counted upon the split within the Conservative ranks in 1934 to complete their destruction at the polls. Harry H. Stevens, Minister of Trade and Commerce, had resigned from the Bennett Cabinet Oct. 27, 1934, as a result of the antagonism aroused among his colleagues by his sensational disclosures as chairman of a parliamentary committee investigating price spreads and business practices (see 1934 NEW INTERNATIONAL YEAR BOOK, p. 117). Mr. Stevens had apparently won the support of a strong element in the Conservative party by his demand for government action to curb the exploitation of the consuming public, the producers, and the workers by "unscrupulous financiers and business men." Moreover, the economic upswing produced in 1933 by the Bennett policies of cheap money and farm subsidies had slowed down considerably in 1934. The Conservatives' high tariff, under which clearly uneconomic industries had arisen in Canada at the expense of the consumers, was a strong factor in the resurgence of the traditionally low-tariff Liberals.

Convinced that radical measures offered the only hope of forestalling crushing defeat, Prime Minister Bennett in a series of radio addresses early in January completely abandoned orthodox Conservative policies and proposed sweeping governmental control and regulation of the economic system. He declared there could be no permanent economic recovery without the reform of capitalism. His programme, resembling in many respects that of the New Deal in the United States, called for minimum-wage and maximum-hour regulations; insurance against unemployment, sickness, accident, and old age; higher taxes on unearned incomes; regulation of the stock exchanges; additional aid to farmers through marketing schemes; a national economic council; control of currency and credit for social ends; and a readjustment of the debt structure. He also proposed the conclusion of a reciprocity treaty with the United States to reduce tariffs and early ratification of the St. Lawrence waterway project to provide additional work for the unemployed. Most of these measures were introduced in Parliament when the session opened on January 17, and many of them were adopted before Parliament was prorogued on July 5 (see *Legislation*).

When the Prime Minister's reform bills were examined they proved to be relatively moderate, middle-of-the-road proposals. They did not go far enough to satisfy the demands of Canadian radicalism, as formulated by the socialist Cooperative Commonwealth Federation, the Social Credit movement in Alberta, or even Mr. Stevens and his adherents. On the other hand Mr. Bennett's "new deal" badly frightened and antagonized a powerful element in his own party. Such powerful Conservative organs as the *Montreal Gazette* and *Financial Post* deserted the party and threw in their lot with the Liberals. At the same time, the Liberals, startled out of their complacency, attacked the Bennett programme as an insincere effort to re-

gain lost popularity. They raised the cry of Fascist regimentation of private business.

The Bennett programme encountered another obstacle in the Canadian Constitution, provisions of which guaranteed the Provinces such extensive autonomous powers as to render any far-reaching Federal social and economic legislation of dubious legality. The Prime Minister attempted to sidestep the constitutional problem by asserting that the entrance of Canada into the League of Nations and the International Labor Office had made labor and social conditions subject to treaty observance and consequently a matter for Federal consideration. But the constitutional issue remained in the foreground, causing dissension within the Cabinet and resulting in the modification of a number of the government measures. The Liberals contended that the reform legislation was futile since it would be overturned in the courts. On February 12 a special Parliamentary committee was established to study the problem and recommend constitutional changes.

As the year advanced, various developments lent both interest and complexity to the political campaign. The final report of the Price Spreads (Stevens) Commission, preliminary reports of which had caused a major sensation, was published on April 12. The majority report proposed the establishment of a Federal Trade and Industry Commission to control and regulate domestic trade. Other recommendations called for changes in the company law, putting managers and directors in a trustee capacity with respect to security holders; a 44-hour week; minimum wage laws for male workers and uniform enforcement of provincial minimum wage laws; collective bargaining; centralized government control of marketing and grading; penalties for false advertising, and amendment of the Weights and Measures Act. The commission reported that free competition was absent in a large proportion of the businesses investigated. Monopolistic trends both in production and distribution had enabled a relatively small group of financiers and business men to maintain or increase their profits during a period when returns to labor, primary producers, and independent distributors had fallen rapidly. The commission also pointed out how tariffs served to restrict competition in many lines. Legislation embodying the above recommendations was immediately introduced.

The annual budget speech of March 23 provided for few changes. A surtax and a gift tax were added to existing individual income taxes. The corporation income tax was raised from 12½ to 13½ per cent. To check bootlegging and smuggling, excise and customs levies on spirits were cut \$3 a gallon. The gold tax was abandoned in favor of a special income tax on owners and stockholders of gold mines. The tariff proposals of the budget speech, placed in effect early in June, made some concessions to British manufacturers who complained of their inability to compete in the Canadian market.

The burden of unemployment relief continued to strain provincial and municipal budgets to the utmost, the cost totaling about \$100,000,000 annually. A conference of 79 mayors held in Montreal on March 25 attempted to force the Dominion to assume complete responsibility for relief, but the Federal Government replied that its hands were tied by the Constitution. During the summer a number of provincial and municipal governments reduced their contributions to the unemployed and in some cases removed all able-bodied single men

from the relief rolls in order to force them into the harvest fields. These moves mollified taxpayers somewhat but stimulated further unrest among the unemployed. During June and July discontent among unemployed single men in Federally-administered camps in the Western Provinces led to a march on Ottawa. The movement, starting in British Columbia, gathered momentum as some 700 men from the camps traveled east by freight train to demand work at prevailing wages in place of the 20 cents a day pocket money provided them in addition to their keep. Prime Minister Bennett refused to meet the demands, which he declared seditious and inspired by communism. The march was broken up by Royal Canadian Mounted Police at Regina, Sask., and its vicinity after severe rioting in which one policeman was killed and 100 persons injured, two of them mortally. This harshness aroused much criticism of the Bennett Government from local and provincial authorities, as well as among the voters generally. Hoping to capitalize on mounting discontent, ex-Minister Stevens on July 7 announced the formation of a new Reconstruction party which actively entered the political campaign.

Meanwhile public credit had been impaired to some degree by the inability of some municipalities and Provinces to meet relief burdens in addition to their normal obligations. In some cities such as Vancouver, B. C., there were threats to go into bankruptcy unless interest rates on municipal bonds were reduced. In Ontario the Liberal Government under Premier Mitchell F. Hepburn made a frontal attack upon the banking and utility interests by canceling power contracts made by the Ontario Hydro-Electric Power Commission with four private power companies. The Liberals charged that the previous Conservative administrations had attempted to sabotage the publicly-owned Hydro-Electric Power Commission by purchasing power from private utilities in Quebec at a higher cost than the production cost in the Hydro's own plants. In retaliation the bankers refused to bid on a \$15,000,000 provincial bond issue offered on June 12. Premier Hepburn, raising the interest rate slightly and shortening the term, offered a \$20,000,000 loan direct to the public. Much to the chagrin of the bankers, it was oversubscribed.

The cumulative effect of the mounting dissatisfaction with the Bennett Government was demonstrated by the results of three provincial elections held during the summer. In the New Brunswick election on June 27 the entire Conservative cabinet was defeated and the Liberals captured all except five of the 48 seats in the Legislature. The Liberal victory in Prince Edward Island on July 23 was even more sweeping, the Conservatives losing all 16 seats which they had previously held in a Legislature of 30 members. Then followed on August 22 the sensational victory of the Social Credit party in Alberta, which overwhelmed the government (United Farmers) party and left the Conservatives only two seats out of the six they previously held. The Liberals also fared badly in Alberta, losing six of their 11 seats. William Aberhart, leader of the Social Credit party, formed a new cabinet. No member of the cabinet or of the Social Credit representation in the Legislature had ever sat in a legislative assembly before.

The Social Credit victory in Alberta, followed by its rapid spread into adjacent Provinces, aroused much concern among Conservatives in general and the two major political parties in particular. Aberhart, the social credit apostle, was principal of a

Calgary high school and director of the Prophetic Bible Institute in the same city. He won the election by guaranteeing every adult citizen a regular income of \$25 monthly. Funds were to be raised by a turnover tax of about 10 per cent on domestic products. The Social Credit triumph dealt another blow to Dominion as well as to Alberta's credit. The provincial bonds declined rapidly in value and large-scale withdrawals by holders of provincial savings certificates forced the government to suspend their redemption on August 29. Premier Aberhart also discovered that before he could even consider putting his scheme into operation, the Province was obliged to raise \$12,000,000 to meet existing pressing obligations. He therefore announced that it would require a year or two of preparation before his Social Credit plan could go into effect. To tide him over until after the Dominion general election, Prime Minister Bennett advanced Aberhart a loan of \$2,500,000 from the national Treasury. Meanwhile, the Prime Minister on August 14 had secured the dissolution of Parliament and called a general election for October 14. As the electoral campaign drew to a close, Mr. Bennett attempted to save his party's cause by increasingly alluring promises to discontented elements among the voters. But it was all in vain.

The General Election. On October 14 the Bennett Government was swept out of office by a Liberal landslide which gave the new government formed by Mackenzie King the largest majority any party had ever held in Parliament. Out of 245 seats in Parliament, the Liberals captured 171 and 8 additional seats were held by independent Liberals who could normally be expected to support the Liberal programme. The standing of the Opposition parties was: Conservatives, 40; Social Credit party, 17; Cooperative Commonwealth Federation, 7; Reconstruction party, 1; United Farmers of Ontario, 1.

The Liberals carried every Province except Alberta and British Columbia. But it was the drift of voters to third parties rather than a great increase in Liberal voting power that decided the election. The Liberal vote increased to 1,877,460 in 1935 from 1,714,860 in 1930, while the Conservative vote fell to 1,222,250, against 1,909,955 received in 1930. The vote for the various other parties in the field was 922,857, against 274,180 in 1930. The Reconstruction party polled 373,479 votes but elected only its leader, Harry Stevens, to Parliament. The Cooperative Commonwealth Federation polled 337,832 votes; Social Credit party, 137,493, Communists, 29,498; Labor, 14,666, Anti-Communists, 3890. The total number of votes cast was 4,022,567, compared with 3,898,995 in 1930. The Reconstruction and Social Credit parties entered the Dominion elections for the first time in 1935. The C.C.F. represented a fusion of the former United Farmers, Labor, and Socialist groups.

William Lyon Mackenzie King became Prime Minister of Canada for the third time on October 23 when his cabinet was sworn in. In addition to the premiership, he held the External Affairs portfolio. Other cabinet members were: Mines, Immigration and Colonization, Interior and Indian Affairs, Thomas A. Crerar, Winnipeg; Justice, Ernest Lapointe, Quebec; Public Works, P. J. A. Cardin, Sorel, Que.; Finance, Charles A. Dunning, Montreal; Postmaster-General, J. C. Elliott, London, Ont.; Trade and Commerce, W. D. Euler, Kitchener, Ont.; Secretary of State, Fernand Rinfret, Montreal; National Defense, Ian Mackenzie, Vancouver; Pensions, and National

Health, C. G. Power, Quebec; National Revenue, J. L. Ilsley, Kentville, N. S.; Fisheries, J. E. Michaud, Edmondston, N. B.; Labor, Norman Rogers, Kingston, Ont.; Railways and Canals, and Minister of Marine, Clarence D. Howe, Port Arthur, Ont.; Agriculture, James G. Gardiner, Sask.; Minister without Portfolio, Sen. Raoul Dandurand, Montreal.

The Liberals in Action. The first action of Prime Minister King was to call a meeting of the Provincial Premiers to discuss the relief and unemployment problem and the allied problem of constitutional revision. At the same time he announced that the Supreme Court of Canada would be asked to rule on the validity of the Bennett labor and social security legislation before the Liberal policy was definitely formulated. The Prime Minister also established a central board of control for the Canadian harbors, thus eliminating seven three-man political commissions. The Liberals also prepared, in line with their campaign promises, to reduce tariffs to the 1930 level. The preferential tariff system established under the Ottawa agreements in 1932 was to be maintained in general, but with reductions on British rates rather than by increases on tariffs on foreign goods. The government was also committed to maintenance of the government-owned Canadian National Railways to assure competitive rates with the privately-owned Canadian Pacific, nationalization of the Bank of Canada; creation of an investment control board in order to improve private corporate finance; and the elimination of public and private price control and of other regulatory legislation restricting domestic trade.

During the electoral campaign the Liberals had attacked the Conservative Government for its failure to negotiate a reciprocal trade agreement with the United States, and Mr. King had promised, if elected, to conclude such a treaty within 90 days. On November 15, a month and a day after the general election, the Prime Minister signed the promised treaty in Washington, following direct negotiations with President Roosevelt and Secretary of State Hull on November 9. By a personal visit to Washington, Mr. King reached an agreement on points which had prevented the successful conclusion of the negotiations initiated in 1934 by the Bennett Government. At the signing of the treaty, President Roosevelt declared that it placed Canadian-American trade relations on a basis of mutual agreement for the first time since 1866. Hopes were high in both Ottawa and Washington that the treaty would permit the restoration of the mutually profitable trade which aggregated nearly \$1,400,000,000 in 1928-29 and declined to about \$525,000,000 in 1934-35.

The comprehensive character of the reciprocal agreement, which President Roosevelt predicted would double trade between the two countries in two years, became evident when the text was made public November 17. The treaty granted Canada lower rates or other concessions on two-thirds of its exports by volume to the United States. The United States in return obtained concessions on three-fourths of her dutiable exports to Canada. The major American concessions to Canada, as summarized in the *New York Times*, fell into the following four groups:

First, the binding on the free list of Canadian exports to the United States which were already free of duty.

Second, reductions in duty, but for specified quantities, of cattle, calves, dairy cows, cream, certified seed potatoes, and certain lumber and timber.

Third, reductions in duty on some kinds of lumber,

cheddar cheese, turnips, apples, hay, maple sugar, live poultry, horses, some fish, and some leather goods

Fourth, the binding against increase of the existing 10 per cent duty on certain feedstuffs for animals

The Canadian concessions to the United States likewise were divided into four categories, as follows.

First, direct duty reductions on 180 items, which accounted for \$175,000,000 out of \$523,000,000 of dutiable imports from the United States during the fiscal year 1929-30.

Second, reductions on all other commodities to the lowest existing or future rates paid by non-British countries.

Third, a guarantee from Canada in a formal diplomatic note attached to the agreement that she would grant a measure of relief from arbitrary import valuations previously applied to many commodities.

Fourth, guarantee of benefits to commercial travelers and transit trade passing through the United States and promised legislation exempting limited purchases of tourists from duty.

Among the major concessions granted Canada by the United States were reductions of \$2.50 to \$5 a gallon on whiskies aged four years or more in wood. Pulpwood, wood pulp, newsprint, shingles and laths, certain fishery products and furs, certain fertilizers, and crude asbestos were bound to the free list.

Canada granted widespread reductions on agricultural products, including fresh fruits, vegetables, and wheat. Potatoes, raw cotton, magazines and periodicals, oranges during part of the year, and tractors were placed on the free list. Other substantial reductions were granted on American machinery, industrial equipment, automobiles and parts, railway cars and parts, electrical apparatus, iron and steel mill products, gasoline, lubricating oils and grease, cotton fabrics, and dressed furs.

The early conclusion of the reciprocity treaty with the United States represented a distinct triumph for Prime Minister Mackenzie King, and it won wide approval in Canada. However, if the Liberals had hoped from this auspicious beginning to enjoy more peaceful and prosperous conditions during their term of office than had their Conservative predecessors, they were rudely awakened by the results of the provincial election in Quebec on November 25. In Quebec the Liberals headed by Premier L. A. Taschereau had retained control of the Legislature by handsome majorities since 1897. In the November 25 election their majority of 66 was reduced to six. While the Conservatives gained some ground, the Liberal losses were due chiefly to the appearance of the new party known as the Action Libérale Nationale, headed by J. Oscar Drouin. In the new Legislature the 90 seats were distributed as follows: Liberals, 48; Action Libérale Nationale, 26; Conservatives, 16.

In accordance with Premier Mackenzie King's promises, a conference was held at Ottawa during December among the leaders of the Dominion and Provincial governments to discuss legislative and financial problems. It was decided to increase relief grants from the Federal treasury and to establish a Dominion Employment Commission to coordinate relief administration. The conference recognized that amendment of the British North America Act to give the Dominion government greater control over nation-wide economic and social affairs was "imperative." It authorized Minister of Justice Lapointe to name a drafting committee to prepare amendments for consideration by another Conference of Canadian Governments, to be held at an early date. Another committee was appointed to discuss debt refunding, duplicative taxes, and measures to secure a more definite allocation of Provincial and Federal taxation fields. Other committees were to seek uniformity in Provincial com-

pany laws and Provincial control of highway transportation. Mining taxation, national highways, and the promotion of the tourist trade also were discussed. A committee was named to take up agricultural marketing problems after the Supreme Court of Canada decided on the constitutionality of the existing Natural Products Marketing Act.

Legislation. The most important legislation enacted by Parliament previous to its adjournment on July 5 may be summarized as follows:

The Wheat Board Act, establishing a board to buy wheat from producers at a fixed minimum price, with the guarantee of a *pro rata* share of the net marketing profits. The government was to absorb the loss if the Board failed to sell the wheat at a profit over the fixed minimum. The Board also took over for sale some 228,000,000 bu. of wheat acquired by the government through earlier price stabilization efforts. The Board commenced operations on September 1 and fixed minimum prices for practically all grades of wheat for the 1935-36 crop year.

An act providing for a Dominion Trade and Industry Commission to take over from the Department of Labor the administration of the Combines Investigation Act, which prohibited monopolies operating to the detriment of the public. The commission was charged with the enforcement of legal commodity standards and with the protection of consumers generally. It began to function Oct. 1, 1935.

Changes in the Criminal Code made it an indictable offense to discriminate between purchasers by granting dissimilar discounts, rebates or allowances, to sell goods in one part of Canada at lower prices than in another for the purpose of destroying competition, or to sell at unreasonably low prices with the same object in view. It was made illegal to employ persons at less than the minimum wage fixed by any law of Canada and to employ child labor. Penalties were imposed for false and misleading advertising.

Amendments to the Weights and Measures Act, effective June 28, which assured the consumers further protection.

The Fair Wages and Hours of Labor Act, guaranteeing fair wages to persons employed on public works and limiting the hours to 8 per day and 44 per week.

The Employment and Social Insurance Act, providing for contributory unemployment insurance for workers receiving less than \$2000 a year, with certain occupations excepted. Equal premiums were to be paid into the insurance fund by employers and employees, the Federal Government contributing 20 per cent of the aggregate premiums and defraying the cost of administration. An Employment and Social Insurance Commission was appointed to administer the act.

The Minimum Wage Act authorizing the establishment of a Federal agency to fix minimum wages in manufacturing and commerce. Its application was restricted to occupations where "no arrangements exist for the effective regulation of wages by collective agreement or otherwise and (where) wages are exceptionally low."

The Limitation of Hours of Work Act, providing for an 8-hour day and 48-hour week for industrial workers.

The Weekly Day of Rest Act, stipulating that industrial workers shall have a rest of at least 24 consecutive hours in every seven days, preferably on Sunday.

Amendments to the Companies Act 1934, establishing further safeguards for the investing public.

Amendments to the Live Stock and Live Stock Products Act, placing private packing-house yards under the Federal regulations applying to public stockyards.

The Fruit, Vegetables, and Honey Act, providing for government inspection and grading of cannery products shipped outside of the Province in which they originate.

Amendments to the Natural Products Marketing Act, extending the operation of the measure to certain forest products designated by the government and providing for "equalization of returns" from the sale of a regulated product.

A Housing Act, making \$10,000,000 of Federal funds available for small dwelling construction and encouraging private lending agencies to provide mortgage funds.

An act establishing an Economic Council to advise the government on social and economic problems referred to it by the Prime Minister.

The rise in world wheat prices resulting from crop shortages and the Italo-Ethiopian war enabled the Wheat Board to dispose of the large wheat surplus accumulated by the Dominion Government without the heavy losses which had been anticipated during the first part of 1935. The Bank of Canada Act, adopted by Parliament in 1934, became effective on Mar. 11, 1935, when the Bank of Canada opened its doors. This privately-owned but government-supervised institution served as a

central bank, its chief function being supervision of the credit policy of the country. Its notes became legal tender within the Dominion and it also functioned as the medium for international exchange operations, with membership in the Bank for International Settlements.

Empire and Foreign Relations. The major event of the year in Canada's external relations was the conclusion of the reciprocity treaty with the United States. The famous *I'm Alone* case, involving an American rumrunner under Canadian registry which was sunk by an American revenue cutter on the high seas in March, 1929, was settled on Jan. 9, 1935. The decision of the commission composed of one Canadian and one American judge named to adjudicate the issue called upon the United States to acknowledge the illegality of the sinking. An apology to Canada and the payment by the United States of \$25,000 to the Canadian Government and \$25,666.50 to the master and crew of the rumrunning ship were also stipulated. The owners of the boat, who were almost all Americans, received no compensation.

A trade war with Japan developed during the year after the Bennett Government had put into effect trade regulations, and particularly exchange equalization provisions, which adversely affected Japanese exports to Canada. Japan in retaliation levied a discriminatory surtax of 50 per cent *ad valorem* on certain Canadian goods. The result was a considerable diversion of Japanese purchases, particularly of wood products, from Canada to the United States. The Canadian Cabinet then imposed a 33½ per cent surtax on all goods imported into Canada from Japan and gave notice that the Anglo-Japanese Trade Treaty of 1913 would be denounced by Canada if the Japanese surtax were not withdrawn. Upon Mackenzie King's return as Prime Minister, he gave notice that his government was prepared to reach an amicable settlement with Japan. An agreement was reached in December and the retaliatory surtaxes were withdrawn by both countries effective Jan. 1, 1936.

The Bennett Government also protested vigorously against provisions of a large timber-purchase agreement signed by British importers early in 1935 with the Soviet wood trust. Canada claimed that the agreement violated Article 21 of the Ottawa Agreements. The British Board of Trade refused to intervene, however. This minor difference did not serve to weaken Canada's support of the British position with respect to the application of League sanctions against Italy. In connection with the application of more rigid economic sanctions against Italy under the Order-in-Council of November 16, steps were taken to guard against the shipment into Canada of camouflaged Italian goods from the United States. The Order-in-Council banned all imports from Italy, prohibited the export to Italy of key materials, such as nickel and copper, used in military operations, and barred the extension of loans and credits.

Plans for experimental flights in 1936 over the projected Ireland-Newfoundland-Canada route preliminary to the establishment of a permanent transatlantic air service in 1937 were laid at conferences held during December in Canada and then at Washington. The agreement envisaged American-British coöperation in operating both the transatlantic and transpacific services. Representatives of the Canadian, American, Irish Free State, and British governments participated in the discussions.

Nation (New York, 1935); H. A. Innis and A. F. W. Plumptre, editors, *The Canadian Economy and Its Problems* (Toronto, 1934).

CANADA, THE UNITED CHURCH OF. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Foreign mission work is carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa). In 1934 there were in Canada, Newfoundland, and Bermuda 7226 preaching places (including home missions) in 2886 pastoral charges, 688,099 communicant members, and 1,667,539 persons under pastoral care. At the sixth general council held in Kingston, Ont., in September, 1934, the Rev. Richard Roberts, D.D., was chosen moderator for the ensuing biennium. Headquarters were at 421 Wesley Building, Toronto, Ont.

CANALS. The completion of the Madden Dam adds additional water supply for the Panama Canal, and, during the year, a five-year programme for repairing the great lock gates at Panama—a difficult job which has made good the wear of 20 years of service—has also been brought to completion.

Probably the outstanding work of the year has been the rapid progress made under the U. S. Army Engineers in the canalization of the upper Mississippi. General Lytle Brown, former Chief of Engineers, U.S.A., presented two important papers in *Civil Engineering* (Am. Soc. C. E., N. Y.) summarizing "Waterways Improvements in the United States" (Oct.) and "Federal River and Harbor Policies" (Aug.).

The late President Coolidge once stated that "our whole century-old policy of developing navigable streams at tremendous cost is either a piece of inconceivable and colossal folly, or else we as a people have been inexcusably remiss in taking advantage of our opportunities." General Brown points out the importance of the great Mississippi River drainage and of its rich resources in coal, oil, and as one of the world's greatest work shops. The Mississippi River problem is now tied up with flood protection rather than navigation. The Ohio River work, first systematically undertaken in 1907, was completed in 1929. Now Army engineers are engaged in providing a similar 9 ft. channel depth on the upper Mississippi, from its junction with the Ohio to the Twin Cities—St. Paul and Minneapolis. Similarly, the Missouri, from its mouth above St. Louis across the State of Missouri, and along the western boundary of Iowa to Sioux City, is under improvement.

These are major problems, involving huge dam and lock constructions which require great engineering skill in design and construction. The technical press has given great attention to the remarkable dam constructions on the upper Mississippi during the past two years, and the Ft. Peck dam (see DAMS) is supposed to be an essential element of the Missouri improvement. The Brandon Road Dam and Lock, near Joliet, Ill., is another element in the upper Mississippi work—a feature of the Plaines River development.

Congress has, however, apparently been satisfied to go ahead with all these vast and costly works without attempting to answer President Coolidge's statement quoted above "To-day," as General Brown observes, "the policy on rivers and harbors is entirely in the hands of Congress." In short, the Army Engineers act simply as the agents of

Congress in carrying out these great works Congress, in turn, appears to pay no attention to the fact that river and canal navigation in the United States seems to be a thing of the past, and has gone ahead appropriating huge sums for magnificent works which, unfortunately, however, serve no useful purpose.

Florida Canal. Work has continued on this project which will make it unnecessary for ships to go around the Florida Keys in order to pass from the Atlantic Ocean to the Gulf of Mexico. Two points of particular interest have developed. The water supply of this area of Florida is drawn from ground water and it has been suggested that a salt water canal will lead to serious difficulties because of the inevitable introduction of salt water into the ground water supply. Although there is some difference of opinion, a special report on this subject indicates that possible interference of this kind will be quite limited in its extent. The second point is one which was raised in the promotion stage of the enterprise, namely the economic value of this work. Many loose statements have been made as to possible savings in operating costs for coastwise shipping but, so far as is known, no attempt has been made to study, in a careful and unbiased manner, the probable volume of traffic which will use this new and costly canal. Apparently, economic justification has been assumed. Actually the work, in all probability, should be classed as a relief measure rather than as a justifiable expenditure which will result in tangible economic benefits comparable in value to the sums to be expended for the work.

CANARY ISLANDS. An archipelago off the northwest coast of Africa, belonging to and administered as a part of Spain. Total area, 2807 sq miles, population (Jan 1, 1934), 584,879. The main towns were Santa Cruz de Tenerife (capital), 65,027 inhabitants, and Las Palmas, 81,858.

Fernández Diez, acting governor and president of the Audiencia Territorial at Santa Cruz de Tenerife, was assassinated in the streets of the capital on Oct. 10, 1935. Police attributed the deed to syndicalist terrorists who were said to have maintained a reign of terror throughout the province. See SPAIN.

CANCER. See BIOCHEMISTRY.

CAPE COLONY. See CAPE OF GOOD HOPE.

CAPE OF GOOD HOPE. A province of the Union of South Africa. Area (including Walvis Bay, 430 sq m.), 277,169 sq miles. The estimated mean population on June 30, 1934, was 3,229,900 and included 775,200 of European origin, 1,901,100 Bantus, 8100 Asiatics, and 545,500 mixed, and other races. Capetown, the capital, had 270,459 inhabitants (including 150,914 Europeans) in 1931. On Nov. 6, 1934, there were 2331 European schools with 150,852 students, and 2472 non-European schools with 249,512 students.

Production. The output (from European farms only) of the main field crops for 1933-34 (in short tons) was wheat, 306,432; maize, 153,737; potatoes, 41,424; barley, 25,244; rye, 20,658; kaffir corn, 6011; tobacco, 1876. Wool and mohair were important products. Livestock in the Province (1933) - 26,600,000 sheep, 5,143,000 goats; (1930, latest figures available) - 3,416,840 cattle, 442,189 pigs, 353,108 horses, 306,998 asses, and 88,834 mules. Mineral production (1933): diamonds, 118,549 metric carats valued at £776,622; asbestos, 3225 tons, £60,306; manganese, 31,051 tons, £20,970.

Government. For 1933-34, total revenue (including £2,681,157 received as a subsidy from the

Union government) amounted to £4,833,745; total ordinary expenditure was £4,613,992. Government was vested in an administrator assisted by an executive committee of 4 members, and a provincial council of 61 members elected for 3 years. The Province elects 8 members to the Senate and 61 members to the House of Assembly of the Union Parliament. Administrator in 1935, J. H. Conradie.

CAPE VERDE (vúrd) ISLANDS. A Portuguese dependency 320 miles west of French West Africa, divided into the Windward (São Vicente, Santo Antão, São Nicolau, Santa Luzia, Sal, Boavista, Branco, and Raso) and Leeward (Santiago, Maio, Fogo, Brava, Rei, and Rombo) groups of islands. Area, 1557 sq. miles; population, 150,553. Chief towns: Praia, the capital on the island of Santiago, 4000 inhabitants; Mindello (Porto Grande), a transatlantic coaling station on the island of São Vicente, 9000.

Production and Trade. Sisal, castor oil, mustard, brandy, coffee, hides, and oranges were the main products. In 1932, imports were valued at 64,959,522 escudos; exports, 1,728,934 escudos (escudo averaged \$0.032 for 1932).

Government. For 1933-34, revenue was valued at 20,927,570 escudos; expenditure, 20,715,050 escudos. By a decree of May 9, 1935, the fiscal year for future budgets was changed to agree with the calendar year and the budget expenditure of 18,747,827 paper escudos for the 18 months ending Dec. 31, 1936, was approved. The dependency was administered by a governor.

CARDUCCI CENTENARY. See ITALIAN LITERATURE.

CARINTHIA. See AUSTRIA.

CARLETON COLLEGE. A coeducational college of liberal arts in Northfield, Minn., founded in 1866. The enrollment for the autumn of 1935 was 745. There were 69 faculty members. The endowment amounted to \$2,870,779, and the total income for the year was \$419,698. The library contained 110,000 volumes and 31,500 pamphlets. President, Donald John Cowling, Ph.D., D.D., LL.D.

CARNEGIE CENTENNIAL. See LIBRARY PROGRESS.

CARNEGIE CORPORATION OF NEW YORK. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable elsewhere than in the United States.

In 1935, as in the previous year, approximately two-thirds of the annual income of the corporation was devoted to a reduction of unpaid obligations, which on September 30 amounted to \$16,271,602.15. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1934-35 the sum of \$3,598,700 was appropriated. Of this amount \$406,450 was applied toward library service; \$372,500 toward the encouragement of adult education activities; \$852,550 toward the support of national organizations in the field of fine arts and of departments of art in colleges and universities and of projects for developing appreciation of the arts; \$692,400 toward the support of educational and scientific studies and research publications; and \$1,274,800 toward general interests, including the Carnegie Endowment for International Peace.

The trustees of the corporation elected for 1935 were: Thomas S. Arbutnot, Newton D. Baker, Nicholas Murray Butler, Samuel Harden Church,

Robert A. Franks, Henry James, Walter A. Jessup, Frederick P. Keppel, Russell Leffingwell, John C. Merriam, Margaret Carnegie Miller, Arthur W. Page, and Elihu Root. Officers of administration were: Elihu Root, chairman of the board; Frederick P. Keppel, president; and Robert M. Lester, secretary. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, THE

A foundation established in 1905 by Andrew Carnegie, who placed an endowment of \$10,000,000 in trust for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. Following its incorporation by Congress in 1906, its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908 and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York. On June 30, 1935, its endowments and accumulated reserves amounted to \$30,807,044, while it had distributed \$28,976,866 in retiring allowances and pensions to 1553 college teachers and 775 teachers' widows, chiefly through 95 associated institutions selected for their educational standing.

The foundation publishes extensive annual reports, which deal with many phases of the educational process. In 1935 it was engaged upon various studies concerning higher education in the United States, professional education, and the relations between secondary and higher education in Pennsylvania. Dr. Walter A. Jessup is president, Dr. Henry Smith Pritchett, president emeritus, and Howard J. Savage, secretary. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE INSTITUTE OF TECHNOLOGY.

A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa., founded in 1900. The enrollment for the autumn of 1935 was 4794, including 2206 registered in the regular day courses and 2588 in the evening courses. For the summer session 708 students were enrolled. The faculty numbered 354. The endowment amounted to \$16,383,000, and the annual income was \$840,000 (not including student fees). The institute is adjacent to the Carnegie Library of Pittsburgh, which has 450,600 volumes.

CARNEGIE INSTITUTION OF WASHINGTON.

An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery and the application of knowledge to the improvement of mankind." Its major activities in 1935 were carried on through the following departments and divisions: Department of Embryology (located in the Hunterian building of the Johns Hopkins University Medical School); Department of Genetics (laboratory at Cold Spring Harbor, Long Island, N. Y.); Geophysical Laboratory; Division of Historical Research, including the sections of Aboriginal American History, United States History, and History of Science, Department of Meridian Astrometry (headquarters at the Dudley Observatory, Albany, N. Y.); Mount Wilson Observatory, in Pasadena, Calif.; Nutrition Laboratory, in Boston; Division of Plant Biology (central laboratory at Stanford University); Department of Terrestrial Magnetism; Tortugas (Fla.) Laboratory of Marine Biology.

In 1935 a new division of Animal Biology was organized to include activities of the Department of Embryology, Department of Genetics, Nutrition Laboratory and Tortugas Laboratory, under

Dr. G. L. Streeter's leadership. A special committee was also appointed to study problems in the field of the physical sciences represented by the Geophysical Laboratory, Mount Wilson Observatory and the Department of Terrestrial Magnetism. An extensive programme of field investigations at the Maya ruins at Copan, Honduras, has been undertaken with cooperation of the Government of Honduras, and with aid of funds obtained from the Carnegie Corporation of New York. In November, 1935, the Institution joined with other Carnegie Organizations in this country and abroad in celebration of the one hundredth anniversary of the birth of its founder.

Income on investments for the year 1935 amounted approximately to \$1,500,000, required almost entirely for support and maintenance of major projects undertaken by the Institution. Results of its work were made known through technical and scientific journals, its yearbook, and a series of scientific monographs and news releases. To date the Institution has issued 675 volumes. Carefully prepared exhibits of research results were shown in Washington in December, 1935, and a limited series of lectures was given representing statements of investigation problems by staff members, including the third Elihu Root lecture delivered by Dr. George Sarton, Research Associate in the History of Science.

Elihu Root is Chairman of the Board of Trustees of the Institution, and John C. Merriam is President. Other trustees: Thomas Barbour, James F. Bell, W. W. Campbell, Frederic A. Delano, Homer L. Ferguson, W. Cameron Forbes, Walter S. Gifford, Herbert Hoover, Frank B. Jewett, Charles A. Lindbergh, Alfred L. Loomis, Andrew W. Mellon, Roswell Miller, Stewart Paton, John J. Pershing, Henry S. Pritchett, William Benson Storey, Richard P. Strong, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. Headquarters of the Institution are at Sixteenth and P Streets N. W., Washington, D. C.

CAROLINE ISLANDS. See JAPANESE PACIFIC ISLANDS

CARPENTER, LOUIS GEORGE. An American irrigation engineer, died at Denver, Colo., Sept. 12, 1935. He was born in Orion, Mich., Mar. 28, 1861, and graduated from Michigan Agricultural College in 1879, and did postgraduate work at the University of Michigan, 1881-84, and Johns Hopkins University, 1885-88. He became, in 1881, assistant professor of mathematics at Michigan Agricultural College, and seven years later, professor of engineering and physics at Colorado Agricultural College, where he served until 1911. In addition to his classroom duties in the following year, he was an irrigation engineer at, and later director of, the Colorado Experiment Station. While at Colorado, he introduced the first systematic instruction in irrigation engineering given in any American college.

Dr. Carpenter's first venture into field work took place in 1890, when he acted as special worker in the United States artesian wells investigation. He also served as an expert in irrigation litigation in the case of the United States vs. Rio Grande Dam, Elephant Butte International case. In 1903 he became state engineer of Colorado, serving until 1905, during which time he was the State's authority in the suits of Kansas and Wyoming against Colorado. Subsequently, he turned to free lance work and served as an engineering authority in the construction of many dams and irrigation enterprises. In 1907 he was appointed referee and

director of the commission named to settle the electric light controversy at Colorado Springs, and in the same year served as a member of the Irrigation Commission of British Columbia to determine the foundation for a new water code, which in 1908 was adopted by the British Columbia Parliament. In 1920, he served as an arbiter, chosen by both sides, in the dispute over the waters of North Platte, in the case of United States vs. Wyoming. During the World War he served on many committees, notably those of the Department of Information and the Explosives Board.

Many distinctions were conferred upon Dr Carpenter. Among these he received the degree of Doctor of Engineering from Michigan Agricultural College in 1927. In 1895 he had been made a Chevalier du Mérite Agricole of France and received a gold medal at the Paris Exposition of 1900. He was elected a fellow of the American Association for the Advancement of Science, and a member of many engineering societies, including the American Society of Irrigation Engineers, president, 1893-95; Colorado Engineering Council, president, 1923; Colorado Scientific Society, president, 1925-28, and served as a delegate to the World's Engineering Congress held at Tokyo in 1929. Dr Carpenter wrote many papers on irrigation activities for the technical press, and was editor of the department of irrigation of the Funk & Wagnalls *Standard Dictionary*. His researches and investigations in the line of irrigation have constantly been used as authority in the Western states in the settlement of disputes concerning water rights.

CARSON, BARON (Life Peer) OF DUNCAIRN, RT HON. SIR EDWARD HENRY CARSON. A British lawyer and statesman, died at Munster-in-Thanel, Kent, Oct. 22, 1935. Born in Dublin, Feb. 9, 1854, he was educated for the law at Trinity College, Dublin, was called to the Irish bar in 1877 and became Queen's Counsel in 1889. Also he was called to the English bar and took silk in 1894. Meantime, he had been returned to the British Parliament in 1892 as Unionist member for the University of Dublin, and was for a short time solicitor-general of Ireland. His entry into Parliament coincided with Gladstone's second attempt to pass the Irish Home Rule Bill, and Carson turned his efforts to its defeat. He devoted himself to the practice of his profession, and appeared as counsel in many famous trials, including the Russell divorce case, and the libel suit brought by Oscar Wilde against the Marquess of Queensberry.

In 1900 he was knighted and appointed solicitor-general, a position he held until the fall of the Balfour Government in December, 1905. Gradually he became the spokesman of the Irish minority in Parliament, but did not emerge as an important political figure until 1911, when another Home Rule Bill seemed imminent. He resisted the Parliamentary bill which would have curtailed the power of the Lords and enabled the Home Rule measure to be passed without an appeal to the people.

At this time, feeling in Ulster ran high, and Carson, speaking at a Unionist demonstration at Craigavon, near Belfast, endorsed the threat of armed resistance voiced by preceding local speakers. He claimed that Belfast was the key and that Ulster would never submit to a Parliament in Dublin. In Easter week of 1912 he presided at another Union meeting at Belfast, which Bonar Law, the new Unionist leader, addressed, and had the people repeat after him, "We will never in any circum-

stances submit to Home Rule." He now gave up his lucrative law practice to devote himself to the Anti-Home Rule Party, strong in Ulster. On Sept. 28, 1912, at a meeting in Belfast, he was the first to sign a solemn covenant binding the men of Ulster to stand behind one another in defending their position of equal citizenship in the United Kingdom and to refuse to recognize an Irish Home Rule Parliament.

The Ulster Unionist Council was organized, under his direction in the early part of 1913, into a provisional government, and a fund of £1,000,000 was guaranteed, he himself donating £10,000. He reviewed nearly 100,000 volunteers who had been organized a year previous, and reiterated his stand of fighting for what they wanted. The Government, suddenly realizing the determination of the Council, made overtures to Carson, and although he welcomed them, warned the Government that that did not establish a basis for separation. His advice to his adherents was "peace but preparation," and in the spring of 1914 he refused the offer of Asquith of a county option of exclusion for six years, saying that that would be "sentence of death with stay of execution." He claimed that there was but one policy to be followed—Ulster should be left out until she wanted to come in. He served as a delegate to the Buckingham Palace Conference, called by King George V in 1914, which broke down at the end of July, leaving Ulster in the position of having to make good her threats of force.

The outbreak of the World War, however, drew attention from the Irish question, and Sir Edward called upon the Ulstermen to join the British Army. He joined the Coalition ministry formed in 1915 as attorney general, but resigned in October of that year because he could not agree with the Government's policy in regard to Serbia. Under the Coalition government formed in December, 1916, he became first Lord of the Admiralty, but resigned the following July. Subsequently he became a member of the War Cabinet, without portfolio, resigning in 1918 because in his opinion the Government did not prosecute the war vigorously enough.

At the end of the War, Ulster regained first place in his thoughts, and at the General Election of 1918 he left Dublin University to represent one of the divisions of Parliament. On the anniversary of the Battle of the Boyne in 1919, he restated the claims of Ulster and threatened to call out the volunteers if the claims were in any way endangered. When, late in 1919, Lloyd George submitted his bill for the reform of the government and the establishment of two parliaments, one in Dublin and one in Belfast with a Federal Council for all Ireland, he modified his attitude, and worked to secure a strong Unionist majority in the elections of 1921 for the first Parliament, and by his efforts, staving off Roman Catholic domination of Protestant Ulster. In that year he accepted the position of Lord of Appeal in Ordinary, holding that position until 1929, and a life peerage as Baron Carson of Duncairn. At the time of the conclusion of the treaty which constituted the Irish Free State and when the bill was before the House, he was bitter in its denunciation. In 1924 he protested vehemently against the bill permitting the British Government to appoint a third Commissioner on the Irish Boundary Commission, due to the default of Ulster, but welcomed the agreement, made in 1925, between the British Government and the government of the Irish Free State and Northern Ireland, which finally settled the question of Home Rule.

CASE SCHOOL OF APPLIED SCIENCE. An engineering college in Cleveland, Ohio, founded in 1880. In the autumn of 1935 the enrollment was 997. The 1935 summer session registration was 112. The faculty numbered 90. The endowment amounted to \$4,100,000, while the net income for the year was \$314,935 (10 mos. ending June 30, 1935). The library contained 26,089 volumes. President, William Elgin Wickenden, D. Eng., D.Sc., LL.D.

CASUALTY INSURANCE. See **INSURANCE.**

CATALONIA. A region in northeastern Spain, comprising the provinces of Barcelona, Gerona, Lerida, and Tarragona. Chief city, Barcelona. See **SPAIN.**

CATHOLIC UNIVERSITY OF AMERICA, THE. A national pontifical institution of higher education, located in Washington, D. C., and founded in 1887 by the Roman Catholic hierarchy of the United States with the approval of the Holy See. The enrollment for the autumn of 1935 was 1455, of which 800 were in the Graduate School, 25 in Canon Law, 43 in Law, 420 in Arts and Sciences, 145 in Engineering and Architecture, 125 in Seminary, 60 in Social Work, and 65 in Sacred Sciences. The summer school enrollment for 1935 was 1510. Thirty-four religious houses, with an approximate enrollment of 2500, are affiliated with the University. The faculties number 190 teachers. The endowment amounted to \$3,500,000, and the annual collection (1935) totaled \$294,000. In the library there were 34,000 volumes. Chancellor, the Most Rev. Michael J. Curley, S.T.D. Archbishop of Baltimore; Rector (Acting), Rt. Rev. Monsignor Patrick J. McCormick, Ph.D.

CAYMAN ISLANDS. See under **JAMAICA.**

CELEBES. See **NETHERLAND INDIA.**

CELEBRATIONS. Chronologically, the first of the major anniversaries of the year was the quadricentennial of the founding of Lima, Peru. A three-day celebration was held from January 18 to 20, closing with the unveiling of several monuments in honor of those who started the Ciudad de los Reyes, as the city was thus named, in 1535.

Beginning Jan. 26, 1935, the State of Michigan opened a two-year celebration of its centennial of Statehood, the two years commemorating the period a hundred years earlier during which the territory struggled for recognition as a State and resulting in the Act of Recognition signed on Jan. 26, 1837. Throughout the year 1935 more than 150 local celebrations were held, running from historical and pioneer picnics to elaborate pageants, parades, and special programmes that lasted from 3 to 10 days. The U.S. Post Office recognized the celebrations by the issuance of a special commemorative 3-cent stamp.

The twenty-fifth anniversary, or Silver Jubilee, of the accession to the throne of King George V was honored throughout the British Empire on May 6. The major celebration was, of course, held in London, with representations from all sections of the empire in attendance. With the major features of the London observance broadcast to all parts of the world, the far-flung portions of the empire were enabled to participate more enthusiastically in their own celebrations.

The opening of a Statewide observance of the centenary of the first settlement of the State of Connecticut was held in Hartford on April 26. A hundred and fifty towns throughout the State held local celebrations during the summer and autumn, with exercises ranging from elaborate pageants,

plays, and concerts to formal parades, often with colorful and historical floats. Though Hartford honored the official close of the celebration on October 12 with an extensive parade, a display of fireworks, and a costume ball, other localities continued to observe the tercentenary until the close of the year. A special 3-cent commemorative stamp was issued by the U.S. Post Office.

The California-Pacific International Exposition in Balboa Park, San Diego, Calif., was opened on May 29. The opening was heralded by a speech by President Roosevelt transmitted by telephone from Washington and amplified for the audience across the continent. The Exposition closed for the year on November 11, and, it was announced, would again be opened on Jan. 15, 1936. The total number of visitors during the 167 days was 4,784,811. Aside from daily open-air concerts, the chief features of interest were centered in an exhibit of the Ford Motor Co., housed in a separate building; in the "Redwood Empire" an exhibit of the products and attractions of California's various counties, and in the "Palace of Electricity and Varied Industries," where foreign and national products were displayed. Other attractions were shown in "The Tower to the Sun," in the exhibit of the Standard Oil Co., in the "Palace of Travel, Transportation, and Water," the "Palace of Education," "Palace of Science," "Palace of Art," etc. Of the concessions, the Midget Village attracted the greatest interest, with the Zoro Gardens and the Hollywood Hall of Fame closely approaching.

On November 20, the birthday of Samuel L. Clemens, known to the world as Mark Twain, the 100th anniversary of his birth was celebrated simultaneously in New York, San Francisco, Bermuda, and Honolulu, where the humorist had lived and written. Under the chairmanship of Nicholas Murray Butler, the main programme was held in New York City, to which the other groups were connected by radio. The world of American letters was represented at each gathering, and the international character of the celebration was observed by the messages sent from notable literary men in other countries.

CEMENT. The production of finished Portland cement in the United States for the calendar year 1935, according to a statement issued by the United States Bureau of Mines, totaled 76,471,000 bbl. as against 77,682,000 bbl. in 1934, or about 43 per cent of the peak production of 176,299,000 bbl. in 1928. Shipments for the year amounted to 74,934,000 bbl. as compared with 75,917,000 bbl. in 1934. A total of 384,993 bbl. of hydraulic cement were exported to the value of \$935,763, as compared with a total of 566,462 bbl. valued at \$1,334,046 for 1934. However, the months August to November inclusive in 1935 showed a distinct gain over the same months of 1934 with a total of 144,362 bbl. as compared with 112,365 bbl. Imports of hydraulic cement during 1935 totaled 617,023 bbl., valued at \$609,076, as compared with 261,844 bbl. valued at \$253,775 for the corresponding period of 1934.

CENTRAL AMERICA. See **BRITISH HONDURAS, COSTA RICA, GUATEMALA, HONDURAS, NICARAGUA, PANAMA, SALVADOR, EL.**

CEYLON, sê-lôn'. A British crown colony. Area, 25,332 sq. miles; population (1931), 5,312,548 compared with 5,463,000 (1933 estimate). Chief cities (with 1931 populations): Colombo, the capital (284,155), Jaffna (45,708), Galle (38,424), Kandy (36,541). During 1934 the school attendance

totaled 653,509; the Ceylon University College had 450 students enrolled in 1933-34.

Production and Trade. The area under cultivation during 1934 amounted to 3,313,000 acres. Rice, rubber, tea, coconuts, cacao, cinnamon, citronella oil, areca nuts, tobacco, spices, graphite and precious and semi-precious stones were the main products. Livestock in Ceylon (1934): 1,094,000 cattle, 522,000 buffaloes, 220,000 goats, 69,000 sheep, 38,000 swine. In 1934, total imports were valued at Rs217,088,892; total exports, Rs263,887,745, including tea (218,695,000 lb.), Rs145,063,000; rubber (79,713 long tons), Rs56,615,226; plumbago (231,385 cwt.), Rs1,654,681 (the average value of the rupee was \$0.3788 for 1934). There were 951 miles of railway; 10,419 miles of telegraph line; and 50,614 miles of telephone line. Telephone service between Ceylon and Great Britain was inaugurated during October, 1935.

Government. For the year ended Sept. 30, 1934, exclusive of Ceylon Government Railway revenue and expenditure, revenue totaled Rs104,100,361; expenditure, Rs93,444,581; public debt, Rs116,901,769. Budget estimates (1934-35): revenue, Rs98,052,000; expenditure, Rs99,559,479; (1935-36): revenue, Rs106,000,000; expenditure, Rs110,731,000. Government was administered by a governor, aided by a state council of 61 members (50 elected, 8 nominated unofficial, and 3 officers of state) Governor in 1935, Sir R. L. Stubbs.

Maldivé Archipelago. A chain of 2000 islets (atolls), 400 miles southwest of Ceylon of which they are a dependency. Land area, 115 sq miles, population (1931), over 79,000 Moslems. Malé was the seat of the government. Millet, coconuts, dried fish, cowrie shell, tortoise shell, and edible nuts were the main products. An elected Sultan headed the government, aided by a Peoples' Assembly of 33 members (28 elected and 5 nominated) and a cabinet of 5 ministers. The Sultan sends an annual embassy to Colombo, Ceylon. Sultan, Hasan Noor-ud-Din (elected Feb. 1, 1935).

History. In the southwestern part of Ceylon, with a population of over 3,000,000, it was estimated that almost 1,500,000 persons had contracted malaria, and the deaths (from all causes) in that area were over 92,000 during the six months, November, 1934, to April, 1935.

CHAMBER OF COMMERCE OF THE UNITED STATES. A national federation of trade associations and local or regional commercial organizations, established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. The membership in 1935 consisted of 1475 chambers of commerce and trade associations covering the entire United States. The chamber maintains 12 service departments, covering the main divisions of business activity. Agriculture; construction and civic development; commercial organization; manufacture; domestic distribution; finance; foreign commerce; insurance; natural resources production; trade association; transportation and communication; research. It publishes a monthly magazine, the *Nation's Business*.

The chamber's twenty-third annual meeting was held in Washington, D. C., Apr. 29 to May 2, 1935. Cumulative disaffection with the major features of the Federal Administration programme for

business recovery was reflected in many of the addresses delivered during the four-day session. This disaffection was ultimately expressed in a stormy session by the passage of resolutions that were directly opposed to the measures proposed by the Administration or already in operation.

The measures opposed were: (1) Modification in the Federal Reserve System "except such as will supply further strength and further usefulness to the plan." The proposed changes, in the opinion of the chamber, "would be to subject the operations of the system to a greatly increased danger of political domination." (2) The Utility Bill of 1935, as introduced in Congress. In its resolution, the chamber reiterated its long commitment to the regulation of utilities by adequate State commissions and concurrent action, where necessary, with the Federal Power Commission. It recognized the existence of abuses that in some instances have accompanied the growth of utility enterprises, and concurred in the need for preventing such abuses. The proposed Bill, however, "not only would seek to superimpose Federal legislation upon State regulation of operating companies, but would undertake to destroy utility holding companies." (3) In regard to the aim of the Administration to have the Congress extend the National Industrial Recovery Act for two years, the chamber noted that "the present law should be allowed to expire in June, but that prior to expiration substitute legislation should be enacted for a definitely limited period on a temporary and voluntary basis." (4) The proposed amendments to the Agricultural Adjustment Act, "to increase the control over any producer, processor, or distributor by license, quota, or otherwise, in the lawful and independent operation of his own enterprise," were opposed. (5) The propriety and the constitutionality of the proposed social security measure were questioned, with a strong recommendation that legislative action be postponed pending a full exploration of the whole subject by a Congressional committee. (6) The measures designed to establish a thirty-hour working week in business and industry and to create a permanent National Labor Relations Board were "definitely opposed" by the chamber. The former "not only would prevent that flexible adjustment of hours so essential to the proper conduct of business operations under constantly varying conditions, but it will inevitably result in marked increases in prices, in turn producing decreased consumption, decreased production and consequent unemployment."

Measures supported by the chamber were: Modifications of the tariff that would lead to reciprocal trade agreement; the Federal regulation of all forms of interstate transportation; direct subsidies for the rehabilitation of the merchant marine; a cooperation between State and Federal governments leading to the withdrawal of sub-marginal lands from production; and the Federal regulation of air transport in domestic and foreign commerce. The chamber also strongly advocated the enactment of laws against "the spread of propaganda and activity by numerous subversive groups" whose common goal is "the violent overthrow of the existing economic and social order in the United States."

The chamber elected Harper Sibley of Rochester, N. Y., as president. The vice-presidents were David F. Edwards, Boston, Mass., and T. Guy Woolford, Atlanta, Ga. See INTERNATIONAL CHAMBER OF COMMERCE.

CHAUTAUQUA INSTITUTION. An educational movement established at Chautauqua, N. Y., in 1874 by Lewis Miller and Bishop John H. Vincent, both prominent in the Methodist Episcopal Church. Its original idea was that of an assembly for Sunday school teachers, but it was gradually developed into an institution affording during the summer months a series of correlated lectures and entertainments. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, symphony orchestra and other concerts, operas, plays, and so forth; the summer school, offering in its 18 departments credit courses under the direction of New York University; and a home-reading circle, in which four or more outstanding books are designated for reading during the year, in addition to a news narrative appearing in a monthly review. The attendance at the annual session is approximately 40,000, while the enrollment in the summer school is about 1500. The officers in 1935 were: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ranson, chairman of trustees; Ernest Cawcroft, chairman of the executive board; Charles E. Pierce, secretary; and Jessie M. Leslie, treasurer.

CHEMICAL EXPOSITION. See CHEMISTRY, INDUSTRIAL AND APPLIED.

CHEMISTRY. During the year 1935 work was actively continued on the transmutation of one chemical element into another; also on "heavy" hydrogen and "heavy" water, and on isotopes. As reported in *Science* (September 27), the transmutation of one chemical element into another by bombardment with high-speed subatomic "bullets," is made possible by an electrical sorting arrangement inside each atom. How the subatomic sorter helps weed out parts of the incoming atom bullets and allows others to enter the nucleus and create a different, heavier atom, is explained in a new theory just announced at the University of California at Berkeley.

Drs. J. R. Oppenheimer and M. Phillips, in the *Physical Review*, described how their explanation of the sorter's operation clears up a mystery of certain puzzling experiments performed by their colleagues, Prof. E. O. Lawrence, Dr. Edwin McMillan, and Dr. R. L. Thornton.

Professor Lawrence's research had found many cases where an element, bombarded with deuterons from his giant sling-shot accelerator, was increased in mass by a unit of one. Thus, aluminum of mass 27, when struck by a deuteron of mass two, turned into aluminum of mass 28 and released a hydrogen particle of mass one, a proton.

Similarly sodium, whose chemical symbol is Na, entered into bombardment reactions of the type:

In each case part of the deuteron (H^2) was captured and went to form a heavier atom, while the rest of the deuteron turned into a proton (H^1).

As explanation, Drs. Oppenheimer and Phillips suggest that the deuteron is not really a single particle but a composite unit containing a neutron and a proton; the proton having electrical charge and the neutron being without one. Don't think of the deuteron, however, as a round, hard particle; for its wavelike nature means it is not confined to a sharply limited volume. As a matter of fact, there is

a good chance that both, or either, the neutron or proton, of which the deuteron is composed, may be some distance away from the deuteron's centre of mass.

Coming up to an atom in the target, say an aluminum atom, the neutron and proton in the deuteron particle behave quite differently. The strong electrical barrier of the atom nucleus stops the charged particle, the proton; but it has no effect on the non-electrical neutron. The latter goes right through the barrier, enters the aluminum nucleus, is captured, and in joining creates a new and heavier kind of aluminum.

One way to think of the atomic happening is to conceive an army half of which consists of men with gas masks and half without. The army is attacking an enemy whose sole defense is a cloud of poison gas thrown up around it. The attacking force comes to the gas cloud. Those parts of the deuteron army with gas masks (the neutrons) can go through the gas (electrical barrier). Those parts without masks (protons) must stay outside and retreat. The analogy falls down in that one deuteron does not consist of many neutrons and protons but only of a single pair. A stream of deuteron particles, however, might be likened to the attacking army pictured.

It is considered likely that *atomic nuclei* are built of protons and neutrons. The neutron may be regarded as having been derived from a proton (H^+) and the negative electron; that is, a "collapsed hydrogen atom."

Since the discovery of "induced radioactivity" by the Joliot's, of Paris, much related work has been done by Fermi and others. Henry A. Barton, of the American Institute of Physics, says: "As a result, it is known that most of the chemical elements can be converted into radioactive elements by nuclear transitions caused by bombardment by either neutrons, alpha particles, or protons. The radioactive elements produced are sometimes isotopic with, sometimes adjacent to, those bombarded. In the latter case, chemical separations have been effected. The average lifetime of the activity varies from a few seconds to a few days. Positive bombarding particles are effective only on elements of low atomic number. Neutrons affect elements up to and including uranium. The radioactive products in the first case usually emit positrons, in the second case, negative electrons."

Heavy Hydrogen. In work under Prof. Hugh S. Taylor, of the Frick Chemical Laboratory of Princeton University, 10 drops of a precious liquid were prepared which were richer in triple-weight hydrogen (H^3) than any ever made before.

In addition to the hydrogen isotope, *deuterium*, of mass 2 discovered by Prof. Harold C. Urey, of Columbia University, for which he received the Nobel Prize in 1934, it is now known that a third hydrogen of mass 3 also exists. This still heavier atom of hydrogen has been produced artificially in Cambridge, England, and in the Palmer Physical Laboratory of Princeton University by nuclear disintegration processes.

In the drinking variety of water the rare isotope of hydrogen is present to the extent of only one part in ten thousand million. Such extremely minute concentrations are comparable with those encountered by Marie Curie and her husband in their original experiments on the extraction of the element radium from its ores. Radium ore which will yield $\frac{1}{2}$ a gram of radium for 5 tons of ore is considered remarkably rich. Radium ores produc-

ing $\frac{1}{2}$ gram of radium for 100 tons of ore are worked commercially.

More than a year ago by the use of the mass-spectrograph designed by Dr. Walter Bleakney, of Princeton, it was shown that the "heavy water" (deuterium oxide) contained small amounts of the third isotope, *tritium*, but in a concentration estimated at one part in 200,000 of the "heavy water" examined.

As stated by Professor Taylor: "During the year the same process of concentration by electrolysis has been continued by Dr. P. W. Selwood, of the Frick Laboratory. There now remains a residual 10 drops ($\frac{1}{2}$ cubic centimeter) from the electrolysis of 75 tons of ordinary water. The tritium concentration has steadily increased until it is now approximately one part of tritium for every 10,000 parts of deuterium water. The experiments show that in ordinary water this type of hydrogen is present to the extent of only one part in ten thousand million parts of water.

"Similar experiments to ascertain whether the electrolytic process concentrates the heavy oxygen of mass 18 over that of normal oxygen of mass 16 have shown that this method is much less efficient. A concentration of water by electrolysis from 120,000 volumes to one volume increased the heavy oxygen concentration merely from one part in 500 to one part in 450.

"While such changes in the ratio of the two species are sufficient for many scientific experiments, it will be necessary to utilize other methods of separation if it is desired to produce pure specimens of the two forms of oxygen similar to those already obtained with deuterium, the heavy hydrogen of mass 2."

Heavy Neon. Preparation of 99 per cent pure "heavy" neon was announced at the meeting of the British Association for the Advancement of Science by Dr. Gustav Hertz, of Berlin. Ordinary neon, which is the gas widely used in reddish advertising signs, consists of the isotopes Ne^{20} and Ne^{22} , the fraction having an atomic weight of 20 predominating. These isotopes occur in the atmosphere in the proportion of nine to one, so the chemical atomic weight is the average atomic weight of the isotopes, namely, 20.2. The concentration of the isotope of mass 22 furnishes the heavier neon in usable or experimental quantities. According to Dr. Aston, of Cambridge University, the concentration of the heavy neon should be a great aid to experiments on nuclear disintegration, because by employing the heavy neon gas, investigators can be sure that its weight is unambiguously 22. Hertz employs the diffusion technique for separating the isotopes of neon. In the diffusion process the lighter kind of neon passed through a little faster than the heavier gas. In five hours it is possible to produce the heavier neon in concentrations of 98 to 99 per cent.

Heavy Oxygen Water. The production of "heavy oxygen water" has been demonstrated at the University of Manchester, England, by T. B. M. Herbert and M. Polanyi. The new apparatus is designed to produce $2\frac{1}{2}$ grams of a gram of the water per day, or about $\frac{1}{10}$ of a drop. As stated in *Science Service*, 1 atom out of every 100 of the oxygen atoms in heavy oxygen water has a mass of 18 instead of the usual mass 16 of ordinary oxygen. In ordinary water the normal proportion is about one in 500. Concentration of the heaviest oxygen is considered a real achievement, since the difficulties are much greater than in separating the famous three kinds of hydrogen discovered.

Prof. G. Hertz, of Berlin, made the world's first sample of heavy oxygen water and presented the precious 10 drops ($\frac{1}{2}$ gram) to Professor Polanyi, who was formerly professor of physical chemistry at the Kaiser Wilhelm Institute. The isotopes or atom varieties of neon, gas now used in electric signs, were also separated by Professor Hertz. Only a very small amount of heavy oxygen water has been prepared. It is probably the world's rarest liquid.

Heavy Water, Production of. Dr. D. S. Cryder, of Pennsylvania State College, informed the American Chemical Society that there is a prospect of obtaining "heavy" water (deuterium oxide, D_2O) on a relatively large scale. Dr. Cryder told how heavy water can be concentrated by distillation of ordinary steam. About a trillion pounds of steam are generated annually by the U.S. power and light industry and 2,000,000 pounds of the now-expensive liquid would result if only 1 per cent of this steam had its heavy water extracted. Dr. Cryder predicted that the new Penn State method would allow production of heavy water at less than \$2 a gram, 10 cents a drop, the present lowest price quoted by Norway where cheap electricity is available. The present method of concentrating deuterium-rich water is by electrolysis. Water with its hydrogen of the double-weight variety—deuterium to chemists—is useful in tracing chemical reactions which may lead to new chemical knowledge of great value to industry.

Isotopes. Dr. F. W. Aston, of Cambridge University, as president of the Section of Mathematics and Physical Sciences of the British Association for the Advancement of Sciences, lectured on "The Story of Isotopes" at the meeting held at Norwich, September, 1935. According to Aston, more than 250 isotopes are known. One of the most complex elements so far observed is tin (Sn), with 11 isotopes ranging in mass from 112 to 124. The chemical atomic weight of tin is 118.70.

Aston has found that his second mass-spectrograph (atom weigher) is capable of an accuracy, in favorable cases, of 1 in 10,000.

Not long ago Lord Rutherford and his colleagues announced to the Royal Society that some of the weights of common elements needed revision. Employing a partially completed mass-spectrograph, Aston has announced in a letter to *Nature* the following masses: For hydrogen, 1.0081; for deuterium or double-weight hydrogen, 2.0148; for helium, 4.0041; for carbon, 12.0048. According to a determination made by Aston in 1926, light-weight hydrogen has a mass of 1.0078; contrasted with the new value of 1.0081. Aston's new atomic weights are as yet provisional, and in no case does he claim a greater accuracy than one in 10,000.

Dr. Aston says: "I am never likely to regret the underestimate of hydrogen's atomic weight that I made in 1926 however serious it may ultimately turn out to be, because of the fundamental part it played in encouraging the search for heavy weight hydrogen (called deuterium) which was discovered in America."

As stated in *Science*, the discovery of deuterium recognized by the recent Nobel prize award to Prof. Harold C. Urey, of Columbia University, resulted from the supposed discrepancy between the atomic weight of hydrogen determined by chemical and physical means after it had been discovered that oxygen, the standard element, was actually triplets instead of just a single element. If Dr. Aston had arrived at the present value of hydrogen's

mass earlier, the successful search for heavy hydrogen might never have been started.

Molecules, Giant. Prof. George L. Clark, of the University of Illinois, and a pioneer in X-ray work, has reported the discovery of giant molecules which weigh about 250,000 times as much as the hydrogen molecule ($H_2=2$). The molecules are egg-shaped and are so large they may be seen with the aid of a microscope, which is the first time any molecule has been seen with such apparatus. These giant molecules are over seven times as large as previous estimates of rubber molecules, yet they are just at the limits of the microscope, being but $\frac{1}{400,000}$ of an inch long.

It has long been known by botanists that the basic structure of cellulose and plant products consists of exceedingly small crystalline particles linked endwise. It appears that these structures could be seen in a microscope and were composed of giant molecules. The reason why scientists did not see the actual molecules before was that they were embedded in a jelly-like material which had previously resisted any breaking-down process. Molecules of such huge dimensions have not yet been produced in the laboratory, but research is expected to reveal their structure and to lead to their production by chemists.

Pure Iron. As reported in the News Edition of *Industrial and Engineering Chemistry*, the purest iron ever made in quantities sufficient for large-scale laboratory tests has been prepared in the Metals Research Laboratory of the Carnegie Institute of Technology, Pittsburgh, Pa.

After analysis of many types of so-called pure iron, "carbonyl" iron was selected, and a special furnace was designed to remove carbon, oxygen, nitrogen, and sulphur, and minute quantities of several other elements that still remained as impurities. The iron was placed in the furnace and heated to just below melting point, and a stream of purified hydrogen was passed over the sample for several hours. To prevent contamination, an iron tube that previously had been purified by the hydrogen treatment was used as an enclosure for the sample. The hydrogen removes practically all the carbon, oxygen, and nitrogen, leaving an iron which contains extremely small quantities of impurities and is probably better than 99.95 per cent pure. The impurities still remaining—silicon, nickel, manganese, chromium, and copper—are present in quantities not more than a few parts in a million, and can be determined accurately only by spectroscopic methods. About 3 pounds of iron are made at one time by the above process.

The next step was to subject the iron to standard metallurgical test. For measurement of the expansion of iron when it is heated, a special dilatometer of high accuracy was designed and constructed. When ordinary iron is heated it expands gradually, until at a little above $900^\circ C.$, known as the critical temperature, it suddenly stops increasing in length and actually contracts. When the temperature is increased above this critical temperature the iron resumes its expansion. Similar changes take place in reverse order when iron is cooled.

Some metallurgists had believed that this change in behavior of iron might be due to impurities, and that if a pure iron were tested this reaction would not occur. Tests of the sample made at the Carnegie Institute of Technology did not support this theory. The pure sample showed a definite transformation change similar to that of impure iron, but the change was much sharper, having taken place within $1^\circ C.$

At the present time in the Metals Research Laboratory tests are being made of steels of unusually high purity made from the iron described above, as well as of commercial steels, to obtain data on the true constitution of high-purity alloys and information on their ability to react.

Recovery of Gold from Solution. Dr. W. E. Caldwell, of Oregon State College, has reported the recovery of gold from solutions in which it is present in as small amounts as one part in four billion. Tests indicated that it was possible to recover up to $\frac{1}{8},000,000$ of an ounce from 10.5 gallons of water, which is one part in four billion. The process was applied to sea-water. Samples pumped from Puget Sound yielded from $\frac{1}{2},500,000$ to $\frac{1}{250,000}$ of an ounce per metric ton of water. It appears from this that there is less than a tenth of a cent's worth of gold at the present market value in a ton of sea-water. The method may be useful in removing gold from ores with a very low content of the precious metal.

Sugar from Dahlias. According to *Science*, the discovery of a source of sugar in dahlias, claimed to be commercially practicable, was reported by Dr. LeRoy S. Weatherby and Dr. Wray M. Rieger, of the University of Southern California. Levulose, the kind of sugar which can be made from dahlias, is nearly twice as sweet as the ordinary cane or beet sugar. It will therefore give people who wish to reduce or remain slim the same sweetness with less weight-adding calories, and save money while doing it. Also, since doctors believe flower or fruit sugar to be oxidized more easily than any other kind, its commercial production may bring relief to many sufferers from diabetes. That sugar can be obtained from dahlias and other fleshy-rooted flowers has been known for some time. Some years ago, chemists of the National Bureau of Standards worked out a process for making inulin from the roots of the Jerusalem artichoke, a kind of sunflower. Dahlias and sunflowers are members of the same plant family. Two different processes have been worked out for the making of dahlia sugar. In one, the juice of the heated dahlia roots is extracted with a large hydraulic press, and the inulin or "dahlia-starch" contained in the juice converted to sugar syrup. In the other, the inulin is converted into sugar within the tubes or roots, and then extracted by means of diffusion batteries, as is done in the manufacture of beet sugar. This process may have a special commercial value because of its adaptability to use in beet sugar factories already built, which now waste large amounts of valuable plant space during the idle seasons. Dahlias have approximately the same yield of roots to the acre as sugar beets when properly cultivated. California is well suited for the production of dahlia sugar because of the abundance of dahlias in gardens of the state. One dahlia garden now has 17 acres under cultivation, and others could easily be grown on short notice.

Why Coffee Grows Stale. According to Dr. R. O. Bengis, of Yale University, coffee grows old because of the action of oxygen on the aromatic fatty substance in the beans which is responsible for their delicate flavor. The process is somewhat analogous to the spoiling of butter. The only thing to be done about it is to get freshly-roasted coffee. Tests on coffee marketed in vacuum cans showed that this method of packing affords only partial protection to the coffee. Even with the best vacuum cans there appears to be enough air left in the cans to start oxidation of the aromatic fatty substance.

Scientific Societies. The American Chemical

Society met in New York City April 22-26. The registrants numbered 5105, which was a record. The Society has a membership of over 17,000. The following papers were presented at the general meeting: Roger Adams, President, American Chemical Society, Introductory Address. Alfred H. White, University of Michigan, "The Scientific Foundations of the American Chemical Industries." Lamot du Pont, President, E. I. du Pont de Nemours and Co., "Human Wants and the Chemical Industries," William B. Bell, chairman of the board, American Cyanamid and Chemical Corp., "Recovery—by Alchemy or Chemistry?" Thomas Midgley, Jr., vice president, Ethyl Gasoline Corp., "The Role of Chemistry in the Next Hundred Years."

At the New York meeting of the Society, President Roger Adams announced that the Priestley Medal, the highest honor of the Society, awarded every three years for distinguished service to chemistry, would be presented to William Albert Noyes, emeritus director of the laboratories of the University of Illinois, to crown a chemical career.

President Adams also announced that Raymond M. Fuoss had been selected to receive the American Chemical Society Award in Pure Chemistry (initiated by A. C. Langmuir)—a diploma and \$1000. Unlike most of the Society's awards, this is for outstanding research by a chemist under 31 years of age. The award was made to Dr. Fuoss as the author of the first comprehensive theory of electrolytic solutions which, at lower concentrations, applies to all solvent media and to all electrolytes.

The 90th meeting of the Society was held in San Francisco, August 19-23. The total registration was 1111. The divisional papers numbered 270.

At the general meeting on Monday afternoon, the American Chemical Society Award in Pure Chemistry (initiated by A. C. Langmuir) was presented to Raymond M. Fuoss, of Brown University, fifth recipient of the honor. Dr. Fuoss' address, incident to the award, on "Properties of Electrolytic Solutions" was given on the following day before the Division of Physical and Inorganic Chemistry.

The previous recipients of this award were: Linus Pauling, 1931, for work on the structure of crystals and the nature of the chemical bond; Oscar Rice, 1932, for studies of the mechanism of chemical reactions; F. H. Spedding, 1933, for the application of spectroscopy to the study of atomic and molecular structure; and C. Frederick Koelsch, 1934, for researches on chemistry of condensed ring systems.

Two distinguished foreign guests of the Society, Professors L. Ruzicka and James Franck, made the principal addresses of the afternoon. Dr. Ruzicka gave a technical discussion of the organic chemistry of the male hormone, while Professor Franck chose the topic "Photochemistry of Chlorophyll." Dr. Ruzicka was also heard in the Division of Organic Chemistry on "Structure of Compounds Containing Many-Membered Rings." Interesting models were shown, in projection form, indicating the possibilities of dovetailing and packing carbon atoms in rings of 15 and more.

One of the most interesting lectures and demonstrations was by F. O. Lawrence, young University of California physicist, who exhibited a piece of sodium chloride which had been bombarded with deuterons and partially converted into sodium with atomic weight 24 (radio-sodium), and entertained the Division of Physical and Inorganic Chemistry

with the rat-tat-tat of the Geiger counter as the new substance demonstrated its strange behavior.

As reported in the News Edition of *Industrial and Engineering Chemistry*, a conference was held at Dearborn, Mich., May 7 and 8. It was initiated by the Chemical Foundation, Inc., and held under the joint auspices of the president of the American Farm Bureau Foundation, the Master of the National Grange, the president of the Chemical Foundation, Inc., and the chairman of the National Agricultural Conference.

The purpose of the conference was to survey the variety of farm products which, through the application of organic chemistry, may be transformed into raw materials usable in industry, and to develop a plan for promoting an increasing use of American farm products in American industry. It was the hope that, through this new alignment of agriculture, industry, and science, new approaches might be made to the long-present problem of non-food uses for agricultural products and the creation of industrial demands that might prevent the accumulation of crop surpluses, perhaps leading to the production of new types of crops which would replace products used almost exclusively for food or feed.

The 68th meeting of the Electrochemical Society was held in Washington, D. C., October 10, 11, and 12, with more than 225 in attendance and participating in a technical and social programme. The scientific technical session on the first day dealt with high-temperature reactions; on the second day with dry cells; and on the final day with storage batteries. The afternoon session of October 12 was on electro-organic chemistry and electro-deposition.

C. E. K. Mees delivered a public lecture on color photography. He gave the history of color photography, explaining the principles underlying the various attempts and displaying samples of product by projection. His lecture was delivered with great clarity and was well designed to give his listeners a far better appreciation of what has been accomplished and the degree of perfection realized in the most recent of these processes, to which the name Kodachrome has been given.

Frank J. Tone was presented the Acheson Medal and prize of \$1000. This award is made biennially to those who have made distinguished contributions to any of the branches fostered by the Electrochemical Society.

The next meeting will be held in Cincinnati, Apr. 23 to 25, 1936, with the two main sessions devoted to inhibitors and high-pressure low-pressure gas reactions.

Awards and Medals. The William H. Nichols Medal of the New York Section of the American Chemical Society was awarded to Father Julius A. Nieuwland, professor of organic chemistry of the University of Notre Dame. This honor has come to Father Nieuwland for "basic work on syntheses from unsaturated hydrocarbons," and in particular for the successful research which he has conducted in investigating the chemistry of acetylene. He has produced a number of new and unusual unsaturated hydrocarbons and hydrocarbon derivatives. One of the industrial results of his fundamental researches is "Duprene," a synthetic rubber-like material which is now on the market.

Charles A. Kraus, of Brown University, was the twenty-fourth chemist to receive the Willard Gibbs Medal, which is the award of the Chicago Section of the American Chemical Society. The

medal was founded by W. A. Converse and, through the years, has grown in significance among such honors. Dr. Kraus was selected by the Jury of Award because he has added greatly to the technic of carrying out chemical reactions in vacuum systems, has made valuable contributions to the knowledge of reactions in liquid ammonia, has enlarged our understanding of the chemical behavior and characteristics of metals, has developed extensively the field of the elements germanium and gallium, and has contributed new ideas and experimental facts related to metallo-organic compounds, especially those of tin, germanium, and gallium.

The Herty Medal, given by the students and staff of the Chemistry Department of the Georgia State College for Women at Milledgeville, Ga., for excellent service rendered in the field of chemistry within the Southeast, was presented on May 18 to Francis P. Dunnington of the University of Virginia. The award is in recognition of the large amount of research which has been conducted by, and under the direction of, Dr. Dunnington and especially for his splendid record as a teacher of chemists who have attained renown.

The Western New York Section of the American Chemical Society, at its meeting on May 7, presented the J. F. Schoellkopf Medal to F. Austin Lidbury, president and general manager of the Oldbury Electro-Chemical Co., Niagara Falls. The citation read: "The Western New York Section of the American Chemical Society awards the J. F. Schoellkopf Medal to F. Austin Lidbury who, in time of need, contributed his successful phosgene-producing process to the United States Government and who, by his constructive interest in the American Chemical Society and related technical societies and by his successful development and management of a chemical manufacturing establishment, has demonstrated both scientific and administrative abilities of a high degree."

The Tappi Medal was awarded to Edwin Sutermeister, chief chemist of S. D. Warren and Co. Mr. Sutermeister was the originator of the pebble-mill test for evaluating paper pulp. The great improvement in wood pulp during the past 20 years may be largely attributed to the testing work done by consumers of pulp. His other particular technical interests include the development and introduction of domestic clays for loading and coating of paper, the development of starches and gums for coated paper work, improvements in soda pulping and size manufacture and application. The medalist is probably most widely known as the author of "The Chemistry of Pulp and Paper Making," which has run into two large editions, and of one of the American Chemical Society Monographs, "Casein and Its Industrial Applications." He is also the author of many papers which have appeared in technical journals. The Nobel Prize in chemistry was awarded to Prof. F. Joliot and Mme. Irene Curie-Joliot for their synthesis of radioactive elements, working in the Curie Laboratory, Paris. Mme. Curie is the daughter of the late Pierre and Marie Curie.

Necrology. Holton, E. C., a famous paint chemist, died on November 30, at the age of 69; a charter member of the Cleveland Chemical Society; first chemist of the Sherwin-Williams Co.; during the World War adviser to the War Industries Board; in 1916 awarded the President's Prize of the Sherwin-Williams Co. for outstanding research work and developments on insecticides; author of many articles. Little, Arthur

D., (q.v.) born in Boston on Dec. 15, 1863; died on Aug. 1, 1935, at Northeast Harbor, Maine; chemical engineer of great distinction. Baker, John Townsend, born June 30, 1860, at Orange, N. J.; died Jan. 17, 1935, at Lake Wales, Fla.; a prominent chemical manufacturer; founded the J. T. Baker Chemical Co., Phillipsburg, N. J. Rockwood, Elbert William, born at Franklin, Mass., July 4, 1860; died July 17, 1935; Ph.D., Yale, 1904; professor of chemistry and toxicology, Iowa, 1888-1935; author of numerous papers in the field of physiological chemistry. Cohen, Julius B., (q.v.) born at Manchester, England, May 6, 1859; died in early June; distinguished teacher and author in the field of organic chemistry. Hooker, Samuel Cox (q.v.) born in England, Apr. 19, 1864; died at Brooklyn, N. Y., Oct. 12, 1935; Ph.D. University of Munich in 1885; chemist and technical expert in the manufacture of sugar; research organic chemist; author of numerous papers; noted for his work in the field of magic. Duisberg, Carl, (q.v.) died March 19 at the age of 73 in Leverkusen, Germany, a leader in the chemical industries of Germany. Jackson, Charles Loring, born in Boston, Mass., Apr. 4, 1847; died Oct. 28, 1935; member of the faculty of Harvard University for 44 years; distinguished organic chemist, author of numerous papers.

CHEMISTRY, INDUSTRIAL OR APPLIED Two exceptions to the general discouragement during the depression are (1) the sound condition of chemical industries and (2) the advances in the field of research. According to the *Industrial and Engineering Chemistry* (October), business is better, despite handicaps and uncertainties which continue to hold it back. The third quarter of 1935 made the record of the year and, with every indication of increased operations in many plants drawing heavily upon the products of chemical industry, there is reason to believe that 1935 business will be the basis of real encouragement—the first for some time.

The Fifteenth Exposition of Chemical Industries was held in New York City from December 2-7. As reported in the News Edition of *Industrial and Engineering Chemistry*, the numerous visitors found convincing evidence that the chemical industries have maintained their traditional position in the vanguard of the parade of progress. Some 110,000 attended the exposition, where they examined the offerings of 254 exhibitors whose

booths tightly packed two full floors of the great building.

From the first glimpse the exposition was impressive, and in many ways the most outstanding of the series which was inaugurated in 1915. In early years these expositions were held annually, but more recently they have been held in November or December of the odd-numbered years. Those who have attended practically all the expositions were frequently heard to comment on the extent to which this, the fifteenth in the series, surpassed all previous shows for the artistic arrangement of the booths. Exhibitors made more effective use than ever before of backgrounds and draperies in arranging their displays, more regard was paid to artistic arrangements and, where appropriate, to modern decorative treatment. Many exhibitors were commended for the excellent way in which they had solved the dual problem of achieving a display which exhibited clearly the product and made a genuine artistic appeal.

Practically all of the many phases of the chemical industry were represented. These included the manufacturers of heavy chemicals, of synthetic organic chemicals, and various specialties; equipment of all descriptions used in the manufacture of chemical products, packages and containers for handling and marketing chemicals.

The features which attracted particular attention were far too numerous to list in detail here. As one went about the exposition it could be seen that the visitors were well distributed among all the booths, clearly showing that each held something important for a share of the audience. The American Chemical Society, with *Industrial and Engineering Chemistry* the immediate sponsor, presented the "Children of Recovery." These succeeded the "Children of Depression," which two years ago proved of such outstanding interest. Like them, the "Children of Recovery" were selected products of research parentage which in the past two years have made good commercially. Space made impossible the inclusion of all of the hundreds that had been suggested but those that were on display maintained the reputation of their predecessors as a centre of real interest.

The Chemical Exposition award was made to F. I. du Pont de Nemours & Company. This company has created vital industries in this country and was able to supply essential organic chemicals on which nearly every industry in the world is becoming increasingly dependent. Among the important productions is "Duprene" or synthetic rubber. Research with this end in view was started in the Organic Chemical Department of the du Pont Company about 10 years ago. The basic material is acetylene (C_2H_2). Father J. A. Nieuwland of Notre Dame University discovered a catalyst which serves to transform acetylene into divinylacetylene. The partial polymerization of this oil yields a synthetic drying oil ("S.O.D."). Many uses have been found for this oil. Thus, it protects equipment against corrosion.

Du Pont chemists converted monovinylacetylene into chloroprene (chloro-2-butadiene-1,3). Chloroprene polymerizes to form synthetic rubber of very high quality. They started with a large-scale pilot plant in 1931, which produced nearly 500,000 lb. in a three-year period. In 1934 the du Pont Company decided to erect a new plant, which is producing at the rate of about one million pounds per year.

"Duprene" is very resistant, especially to oily materials, which cause natural rubber to swell and disintegrate. It also stands heat better than natural

rubber, and also resists the action of acids and of alkalis. There is an increasing demand for the product.

The du Pont Company has also succeeded in producing camphor from turpentine, a hydrocarbon having the formula $C_{10}H_{16}$. A plant was completed and put into successful operation in 1934, which has an annual capacity of 1,500,000 lb. A highly refined product is obtained, superior to the synthetic material imported from abroad.

Hydrogenation of Coal. A completely new and most important British industry was started with the opening by Ramsay MacDonald of the coal hydrogenation gasoline plant of Imperial Chemical Industries at Billingham-on-Tees. This is particularly important because it can technically make Great Britain independent of imported oil supplies, with the exception of lubricating oil. At present it is making 4 per cent of the country's gasoline. Previously the experiment was being carried on in various countries, and received its first impetus after the world war with the growing spirit of nationalism, steadily mounting tariff barriers, and unrest in coal mines and heavy industries where there was much unemployment.

At present it is more expensive to produce gasoline from coal than to import it, so the Imperial Chemical Industries must be protected by means of tariffs. The process employed is this—add more hydrogen to coal, and adjust the oxygen content, for in oil the proportion of hydrogen is higher than in coal. Gasoline and gaseous hydrocarbons result. Dangerously high temperature and pressure must be used, and there have been many technical difficulties to overcome.

In Germany the Interessengemeinschaft is doing the same thing with lignite and it is given preferential treatment by the government. Great Britain uses bituminous coal and is the first to do so, while the U.S.A. employs petroleum. The British, German, and American concerns have pooled their patent rights and exchanged technical information through the formation of the International Hydrogenation Patents Co. Additional plants are being built in Germany, both for bituminous coal and lignite treatment.

The Billingham plant is intended to produce 150,000 tons of gasoline a year—50,000 to be made from coal or creosote oil and low-temperature tar, and the rest from bituminous coal. The normal rate of production is 410 tons of gasoline a day. A ratio of 4 tons of coal to 1 ton of gasoline can be maintained even without using creosote or low-temperature tar.

Metals. Recently there has been considerable interest in the metal, indium. It is being produced at the rate of 9000 oz. Troy per month. It is delivered in bars each weighing 2 oz. and the metal is of high degree of purity. A consistent mineral deposit containing indium has been discovered. Indium is purified by electroplating. It is used for plating and alloying. The metal sinks into the surface of copper or silver and both hardens and protects the surface. It also is used to improve dental gold.

According to *Science*, zinc and paint are chemically hostile to each other and that is why the average householder finds it so difficult and expensive to keep his zinc-coated eavetroughs decently painted up. Dr. Henry J. Wing, chemist at the works of F. I. du Pont de Nemours & Company, Wilmington, Del., reported an investigation in which he started with the commonly observed fact that paint flaking off zinc-coated metal is

covered on its contact side with a white film. Then he made the purest and smoothest zinc surface possible, by coating small pieces of glass on one side with zinc in the same way that aluminum is used to form reflectors for modern astronomical telescopes. These he exposed to fumes from ordinary paint. The same white stuff formed on the mirror surfaces. Upon analysis this was found to be zinc formate, a compound of zinc and formic acid. Analysis of the white stuff from "natural" paint flakes off the surface of galvanized iron showed the same substance to be present. Paint removed from plain iron did not have it. This solved the riddles, but the answer has not yet been forthcoming. Before paint chemists can know how to make paint stick to zinc further research will be necessary.

A study of a combination of silver and electricity to preserve fruit juices such as cider and grape juice is being made by Lawrence H. James and E. A. Beavens, of the U.S. Bureau of Chemistry and Soils, and was reported to members of the Society of American Bacteriologists. The method is similar to the sterilization of water in swimming pools by the use of colloidal silver. A small electric current is passed through a solution, which forces the silver into the juice so that when enough silver is present, it delays fermentation of the fruit juices.

Minerals and War. Sir Thomas Holland has written a book entitled *The Mineral Sanctions as an Aid to International Security*. According to Dr. William Cullen (*Chemistry and Industry*, Aug. 23, 1935, p. 778), if the scheme which Holland advocates had been adopted 12 months ago, neither Japan nor Italy would have been so "difficult." The British Isles are poorly provided with minerals, but the British Empire is very well off. The only serious deficiency is mineral oil. The U.S.A. is very favorably situated, but is almost entirely dependent upon foreign sources for chromite, manganese, nickel, tin, asbestos, tungsten, and, to a certain extent, bauxite. The British Empire and the U.S.A. combined control within their own borders something like 75 per cent of the metals and minerals which are required in war, but these same materials are also necessary for carrying on in peace. No nation could prosecute a war of any magnitude today without the certainty of a constant supply of certain essential metals and minerals. If, then, these supplies could be stopped, war could not be carried on. "In any case it can be assumed that if we and the U.S.A. could come to some arrangement whereby we jointly refused supplies to any disturber of the peace, then with this possibility ahead, nations would think twice before threatening war."

Petroleum Reserves of the United States. The Bergius process for the hydrogenation of coal is looked upon as possibly helping to provide a substitute for petroleum in the United States, when our supplies of oil have been exhausted. However, government statisticians, economists, and petroleum specialists in Washington feel that there is no danger of an imminent gasoline shortage in this country. With the discovery of new oil fields we should have on hand enough reserves to make our supply last a great deal longer than 13 years—a time limit once mentioned. Dr. Benjamin T. Brooks, chemical engineer, and L. C. Snyder, geologist, had predicted before the American Chemical Society, a serious petroleum shortage between 1940 and 1943. The United States consumes normally about one billion barrels a year and consumption

may rise. It is usually higher in the summer months.

As a member of the Petroleum Administrative Board said, "Sooner or later a substitute for natural petroleum as the principal source of motor fuel must be found, but what it is, or when it will be commercially practical, we don't know." Perhaps shale oil may be substituted if a more satisfactory and cheaper technical process can be found, or the hydrogenation of coal may be used.

Refining Lubricating Oils. A revolutionary process has been developed for the refining of lubricating oils. Formerly sulphuric acid, sodium hydroxide, and lead monoxide were the refiners' chemical standbys. According to *Chemical and Metallurgical Engineering* (May), within the past year 13 out of 21 solvent extraction plants were placed in operation, yielding 17,500 bbl. daily of a total of 23,000 bbl. of finished oil by these processes. The oil is of high quality and can be produced more economically. The solvents remove the "naphthenic" portions of the crude oil, leaving behind the "paraffinic" fractions. In 1934 the U.S.A. consumed 10,500,000 barrels of motor lubricants and 8,000,000 barrels of industrial lubricating oils—a total of 18,500,000 bbl., valued at about 120 million dollars.

Removing Salt From Sea Water. As reported in an editorial in *Chemistry and Industry* for May 24, one of the many remarkable scientific discoveries of the year was made in the Chemical Research Laboratory at Teddington, England. Sea water was converted into drinking water. This was done by passing the water through four tubes containing synthetic resins. The first and third tubes contained a resin prepared from formaldehyde and tannin materials; it removed the basic constituents of the sea salts. The second and fourth tubes were filled with a resin made from formaldehyde and aniline; it removed the acidic constituents which were formerly combined with the metals. The water issuing from the fourth tube was free from inorganic matter and drinkable, though not palatable without further treatment. It is probable that commercial application will be made of the process.

Selenium in Soils. According to Horace G. Byers and Henry G. Knight of the Bureau of Chemistry and Soils, U.S. Department of Agriculture, as reported in *Industrial and Engineering Chemistry* a new agricultural question has arisen in connection with selenium in soils. It has been shown that selenium is present in a wide variety of plants growing in certain soil areas, particularly in limited portions of the West. The element is present in plants in concentrations which range from traces up to quantities which are lethal to animals. In many cases the selenium produces chronic diseases which may ultimately cause death. They say: "It is true that quantities of foodstuffs have been produced and marketed and, unless preventative measures are taken, will continue to be produced and marketed. It seems, however, that no serious concern need be felt except in the areas concerned. In the general market it is improbable that any serious concentration of toxic food is likely to reach any individual. Within the toxic areas serious injury to stock raising has been encountered and human injury, especially to the young, may have occurred."

Wheat grown experimentally in selenium-bearing soils was found to be fatally poisonous to animals to which it was fed.

See FERTILIZERS.

CHESS. The ending of Dr. Alexander Alekhine's eight year reign as world's chess champion was accomplished during the year 1935. The over-turning of the champion was achieved by Dr. Max Euwe, of Amsterdam, who in a match of 30 games, played in Holland over a two month period, downed Alekhine, 15½ to 14½. Alekhine had won the title from José Capablanca in 1927 and had defended it successfully in previous years, but the mathematics teacher from the girls' school in Amsterdam proved the Russian's master. Dr. Euwe won 9 games, lost 8, and drew 13.

That the United States is now the ranking chess playing country was clearly shown again at the international team tournament at Warsaw where five Americans defeated 19 other nations for the Hamilton-Russell Trophy for the third consecutive time. The Americans won 17 matches and lost 2. Sweden was second in the team score, with Poland and Hungary third and fourth. The American team consisted of Reuben Fine, Frank Marshall, Abraham Kupchik, Arthur Duke, and Israel Horowitz. The Americans had previously won the Trophy at Prague and Folkestone.

Samuel Reschovsky, New Yorker, won the international masters' tournament at Margate, England, topping Capablanca and Sir George Thomas among others. Reschovsky also won the tournament at Great Yarmouth, where Dr. Adolf Seitz of Augsburg was runner-up. Fine, Duke, and Herman Steiner shared equally the first three prizes in the international tourney at Mexico City, with Capt. J. J. Araiza, Mexican champion, and Col. Manuel Soto Larrea fourth and fifth.

Dr. S. Tartakower, of Poland, won the international masters' tournament at Lodz. Fine was second with S. Kolski of Poland. K. Opocensky of Czechoslovakia was fourth. Duke won the Pacific Coast championship, defeating Steiner in a match at Los Angeles. Fine won the Western championship with Duke runner-up and Isaac Kashdan, New York State winner, third.

CHICAGO. See SEWERAGE AND SEWAGE TREATMENT; WATERWORKS; MUSIC; ILLINOIS.

CHICAGO, THE UNIVERSITY OF. An institution of higher education and research in Chicago, Ill., founded in 1890. The University is privately endowed, coeducational, and non-sectarian, although one-third of its 30 trustees must be Baptists. John D. Rockefeller founded the university and his personal gifts amounted to a total of \$35,000,000 over a period of 20 years. On Oct. 1, 1935, the members of the faculty, exclusive of assistants and of teachers in the laboratory schools, numbered 895. In all departments and in all grades of service the university employed approximately 3000 persons.

During the summer quarter, 1935, the enrollment was 4567, of whom 2118 were men and 2449 were women. In the autumn quarter, 1935, the total enrollment was 8225, a gain of 1 per cent over the same quarter of 1934. Of the total, 4525 were men and 3700 were women. In the college and upper divisions there were 2661 men and 1625 women; in the professional schools there were 1147 men and 668 women; and in University College downtown there were 695 men and 1373 women. Of the total enrollment, 1826 men and 1044 women were classified as graduate students; 1952 men and 1220 women were classified as undergraduate students; and 52 men and 63 women were classified as special students or students-at-large. Total enrollment for the academic year 1934-35 was 13,050. The Home Study, or correspondence de-

partment, had an average enrollment above 3500, which is exclusive of the totals given above. During the academic year the university granted 1654 degrees and 163 four-year certificates in medicine. Of that total 293 were Master's degrees and 186 were Doctorates of Philosophy. The total number of matriculants since 1892 approached the 175,000 figure.

The assets of the university as of June 30, 1935, amounted to \$110,500,222.11, an increase of \$143,027.73 over the figure for the same date in 1934. These funds were divided as follows: Endowment, \$59,478,903.79; plant, \$41,057,318.32; other funds, \$9,964,000.00. The total income under the university's combined budget for the fiscal year 1934-35 was \$7,345,537.02, an increase of \$479,657.12 over the expenditures of the previous year. The total amount of gifts paid in was \$1,859,339.04.

The University of Chicago Press published 52 books during 1935, in addition to 36 paper-bound pamphlets, 16 scholarly journals, and the annual proceedings of a number of organizations. Six one-reel sound films, designed as aids in the teaching of geology, directed by Dr. Carey Croneis of the university's geology department, were issued through the press during the year. These films are the second group of six produced by the University and Erpi Picture Consultants in the field of the physical sciences, as the first units of a project to produce teaching films in various fields.

Under the direction of Dr. A. H. Compton, university physicist, a renewed attack on the problem of cosmic rays was begun, which included the establishment of seven permanent cosmic ray measurement stations at various sites and the construction of a large electro-magnet for measuring the disintegration effects of the rays in a magnetic field. University chemists and obstetricians, working cooperatively, obtained in pure crystalline form the active principle of ergot, a drug useful in childbirth. A group of university biologists isolated the "bacterium necrophorum" as the apparent cause of chronic ulcerative colitis. A clinical psychiatric department was established in the university's South Side medical development. The university entered into a cooperative venture in educational broadcasting with Northwestern University and DePaul University, the joint project being embodied in the University Broadcasting Council.

The number of bound volumes in the university libraries rose to 1,112,000; periodicals currently received exceeded 5000. Under a foundation grant the university carried forward a large-scale programme of acquiring basic research documents in the social sciences, gathering public records of many American and Canadian local governments, increasing the map library to 80,000 maps, and adding subscriptions to 25 American and foreign newspapers. Experiment was undertaken with a view to the reduction of many types of documents to film form, and complete records of NRA and AAA hearings, totalling above 300,000 pages, were acquired in that form. A start was made in the building of a collection relating to Stephen A. Douglas, which is of particular interest in view of recent acquisitions of collections of Lincolniana. President, Robert Maynard Hutchins, LL.D.

CHILD, RICHARD WASHBURN. An American author and diplomat, died in New York, Jan. 31, 1935. Born in Worcester, Mass., on Aug. 5, 1881, he graduated from Harvard University in 1903 and from the Harvard Law School three years later. In 1924, Harvard conferred upon him the

degree of Doctor of Laws. Upon graduation, he began the practice of law and one of his first cases was acting as legal adviser to a group of engineers building a dam on the Mississippi River at Keokuk, Iowa. Along with his law practice, he devoted considerable time to writing, and his first novel, *Jim Hands*, was published in 1910. During the early part of the World War, Mr. Child served as a war correspondent with the Russian forces, and returning to the United States in 1917, became associated with Frank A. Vanderlip in his war finance work in the U. S. Treasury until 1918.

In the 1920 presidential campaign, he served Warren G. Harding, the Republican candidate as adviser, and in 1921, upon the election of Mr. Harding, was appointed ambassador to Italy. During his services in Italy he became the confidant of Benito Mussolini and assisted him in the preparation of his autobiography, which was published in 1927. For his services while Ambassador, Mr. Child was rewarded with the Order of St. Maurice and St. Lazarus, and the Order of the Crown of Italy. While at Rome he was appointed American observer at the International Economic Conference at Genoa in 1922, and in the same year was American delegate to the Conference on the Near East at Lausanne and represented the United States in the negotiations of the Lausanne Treaty. In the fall of 1923 he resigned, but at the request of the President, Calvin Coolidge, his resignation did not become effective until early in 1924.

Upon his return to the United States he continued his literary work, writing articles on world affairs for newspapers and magazines. In 1925, he founded the National Crime Commission to combat crime in the United States, which he believed was a menace more threatening than war. In 1932, Mr. Child, a life-long Republican, supported Franklin D. Roosevelt, the Democratic candidate for the presidency, serving as chairman of the Republicans-for-Roosevelt League. The following year he made application for a renewal of his license to practice law and opened offices in New York. In March, 1934, President Roosevelt appointed him special adviser to Secretary of State Cordell Hull, and he made a three months' tour of Europe investigating economic conditions.

Besides frequent contributions to magazines and newspapers, his published works included: *The Man in the Shadow* (1911); *The Blue Wall* (1912); *Potential Russia* (1916); *Bodbank* (1916); *Vanishing Men* (1919); *Velvet Black* (1920); *Fresh Waters* (1924); *A Diplomat Looks at Europe* (1925); *Battling the Criminal* (1928); *Writing on the Wall* (1928); and *Pitcher of Romance* (1930).

CHILD LABOR. The first nation-wide attempt to control child labor in the United States came to an abrupt end with the decision that the NRA Codes were unconstitutional. This event in effect returned the problem to the status characteristic at the beginning of 1933. At that time every effort was being made to force through State Legislatures the so-called Child Labor Amendment. The necessity for this was clearly apparent to the proponents of the measure from the fact that more than a century of reliance on State legislation as a means of protecting children from the hazards of industry had proved a failure. As late as 1935, 9 States, because of exemptions, permitted children under 14 years of age to work in factories; 8 States permitted children between 14 and 16 to work legal days 9 to 12 hours; 11 States allowed such children to work as late as 8 p.m. or after; and

34 States had practically no regulations regarding the employment of 16- and 17-year-old boys and girls in occupations recognized as hazardous.

The difficulty in hoping for complete success through the passage of legislation in the individual States is also clearly illustrated by the fact that whereas in the decade 1920-30 the number of children 15 years and under employed in the textile industry decreased 59 per cent, in two important southern textile States, South Carolina and Georgia, the number of children employed in textile mills increased 20 per cent in the decade specified. These children may, under the existing laws, work for 10 hours a day, six days a week. This is to say, the shift of an industry from one section of the country to the other can lead to the cancellation of gains made within the older industrialized States.

The success of Federal control through the child labor provisions of the NRA codes, which established a 16-year age minimum in most industries for full-time employment, an 18-year age minimum in certain hazardous employments and severely limited the outside of school hours permit to 14-year-old workers, illustrated to the proponents of a Federal constitutional amendment the necessity of achieving their objective. For example, the Pennsylvania Department of Labor and Industry in 1934 made a survey of the cotton garment industry in that State as it was operated under the NRA. It reported: "Only two children under 16 years were found at work out of 12,000 employees, and this in an industry where one worker in every 25 was under 16 years of age in 1932."

Child Labor Amendment. The Child Labor Amendment has thus far been ratified by 24 of the States: Maine, New Hampshire, New Jersey, Pennsylvania, West Virginia, Ohio, Indiana, Michigan, Illinois, Wisconsin, Minnesota, Iowa, North Dakota, Arkansas, Oklahoma, Colorado, Wyoming, Montana, Idaho, Utah, Arizona, California, Oregon, and Washington.

During the month of February of the year 1935 a Special Committee of the American Bar Association issued a report in opposition to ratification. Although this may be taken as the official position of the principal legal organization of the nation, many distinguished lawyers have declared in favor of the amendment including Newton D. Baker, Paul D. Cravath, Manly O. Hudson, George Z. Medalie, Roscoe Pound, Samuel Seabury, Charles P. Taft, II, Allen Wardell. The opposition, however, includes a variety of groups—a notable number of newspapers, a large proportion of the principal spokesmen of the Roman Catholic Church, a majority of the associations of manufacturers, and educators like Nicholas Murray Butler. On the other hand, the amendment has the support of equally eminent persons in each of the groups specified, and of President Roosevelt. The present hope of the proponents of the measure is that it will be passed during 1937. See LAW.

Child Labor Flourishes. Children employed in the field of agriculture are especially numerous where such products as sugar beets (Colorado), onions (Ohio), small fruits and berries (Michigan, Oregon, Washington, and California), cotton (throughout the producing area), and vegetables for market are produced. Industrially, children find employment in textiles (Georgia, South Carolina, North Carolina, and Mississippi); young girls in hairdressing establishments, barber shops, etc.; and in the needle industries, especially shirts,

neckties, etc. (Connecticut, Rhode Island, Pennsylvania).

A special study made of the employment of children in the distribution and selling of newspapers and periodicals throws considerable light upon the nature of their activity in connection with an industry that employs large numbers, although part time. This study, which was made by the Children's Bureau of the U.S. Department of Labor, was concerned with employees under 16 years of age in 17 cities. More than 4000 children—1259 newspaper sellers and 830 carriers, and 1121 magazine sellers and carriers—were included; and the cities studied were in the South, Middle Atlantic, New England, Middle West, and Far West areas. While it was discovered that in most areas the age of the children engaged in this work has increased in the last decade, though slightly, the change was attributed chiefly to the fact that other employment opportunities for older boys were limited by the depression. How permanent this gain will be, therefore, is difficult to say.

In 1934, the newspaper sellers worked 156 hours per week, and the carriers, 10.3 hours per week. In general, the older the boys the shorter the hours and the higher the earnings. Boys under 12 earned a median of 82¢ and worked a median week of 17.8 hours; boys 12 and 13 earned \$1.30 a median week of 15.4 hours; and boys 14 and 15 earned \$1.82 for a median week of 15.4 hours. Only 7 per cent of the younger boys studied earned \$4 a week or more and 10 per cent of these were 14 or 15 years old. The practice of selling papers late in the evening is, the report says, on the decline, though it has not vanished. The study showed that 23 per cent of the boys stayed out until 10 p m on school days, and on Saturdays, 31 per cent.

For magazine sellers and carriers, the situation has changed for the worse in recent years, for the reason that larger numbers of children have been drawn into activity and instructed to carry on their solicitation in business places and restaurants. The tendency of the distributors is to employ large numbers of boys, thus cutting down the possible earnings. The report states that earnings were uniformly extremely low and the chief attraction was prizes offered, not cash. The periodical publishing companies are making some effort to improve the situation by instructing their agents to get the consent of the parents before making arrangements with children for selling.

NRA Termination. As we have remarked before, the termination of the NRA codes promised to cancel the gains made under them. Moreover, a study made by the National Child Labor Committee covering the years 1920 through 1934 illustrates that the employment of child labor is exactly correlated with the general state of employment in the manufacturing industries. The only exception to this rule is the period when the NRA codes were in effect and there was also a rise in general employment. The Committee suggests that with the general improvement in employment conditions without legal safeguards, the number of children actually employed will increase.

As to the volume of child labor, there was considerable variation among the States. In New York but 1.6 per cent of the children in the young age groups were employed and it is expected that the number will be still further reduced by a new State law which comes into effect in 1936. There are seven States with somewhat better records than New York, or with less than 1 per cent of their children employed. On the other hand, there

are seven States at the other end of the scale ranging from Louisiana with 10 per cent of its children employed to Mississippi, with 24.9 per cent.

Working Permits. In New York City, the effect of the NRA decision is illustrated by the fact that full-time working permits were granted to 1428 children between 14 and 15 during September, 1935, as contrasted with 390 in 1934. Students of the subject emphasize, however, that the full effect of child labor can not be measured by the numbers actually employed in industries where working cards are required, for the reason that industrial home work is engaged in by children almost as frequently as by adult women. They also point out that children, like women, are at once the victims of and the cause of low wages, and therefore are an important factor in pulling down wages of all persons employed. In a period when employment opportunities are severely limited, and competition for jobs is keen, the children, like the women, are drawn into industry in increasing numbers even though men can not find work. In spite of this, the number of children on relief is large, and the number of young boys and girls who have come to the working age during the depression who have never found jobs, is an important factor in keeping the total number of unemployed at a high level in the nation.

CHILD WELFARE. Children on Relief. A significant aspect of child welfare is the number of children on relief. A study of the Federal Relief population, as of May, 1935, revealed that at a time when every seventh person in the United States was on relief, every sixth person on relief was a youth, i.e., was between 16 and 24 years of age. Moreover, two out of every five youths on relief were found to be in rural areas and of 25 youths on relief 21 were found to be white and four colored. In terms of numbers it was disclosed that two-fifths of the persons receiving Federal aid were under 16 years of age. A statement made by Katherine F. Lenroot, Chief of the U.S. Children's Bureau, reads:

With the average amount of relief per family per month as low as \$8.23 in the State with the lowest average, and rating only \$42.36 in the State with the highest average, it is obvious that the health and welfare of these children are in serious jeopardy. These children have a right to expect that the Federal, State, and community relief policies of 1935 will provide more adequately for essential items in the family budget.

In this connection, a report made to the Board of Education of New York City at about this same time revealed that 18 per cent of the city pupils lacked proper food—a total of 135,000 individuals. The Borough of Manhattan where many thousands of youngsters are jammed into congested, poverty-stricken, areas on the east and west sides and in Harlem, shows the highest ratio of malnutrition—23.8 per cent; the Bronx follows with 20.8 per cent. This represents a general increase of 25 per cent in the ratio of malnutrition since 1929.

Dependent Children. Provision for the care of dependent children is an integral part of the so-called Social Security Act passed by Congress in 1935. In connection with the preliminary studies being made preparatory to the putting of the Act into operation during 1936, the Federal Emergency Relief Administration published a "Digest of state and territorial laws granting aid to dependent children in their own homes as of November 1, 1935." Selecting six States at random, a general picture of the present legal status of this particular aspect of child labor will be obtained.

Maine. Under a mandatory law of 1933, mothers with children under 16 years of age who have resided in the State for five consecutive years previous to the application and who need and desire aid to enable them to maintain themselves and children in their homes and are mentally, morally, and physically fit to bring up the children in suitable surroundings are entitled to aid if they have been deserted for one year or if the husband has willfully refrained from supporting the mother and the children. The amount granted is not specified by law; the duty of investigating the case and granting an allowance is lodged in municipal boards under the supervision of the State Department of Health and Welfare; and the funds are charged 50 per cent to the State and 50 per cent to the municipalities.

New York Under the New York law governing this type of relief, children under 16 in the charge of the mother or of a relative within the second degree of either the father or mother, the persons in charge meeting the specified requirements as to citizenship and residence, are entitled to a grant of an amount not specified but described as adequate to enable the mother or relative to bring up the children properly. Direct responsibility for the administration of this aid is lodged in county boards of Child Welfare with certain exceptions for large municipalities, under the supervision of the State Department of Social Welfare; and funds are provided by the counties or cities making the grants.

Georgia No provision.

Wisconsin Under the Wisconsin law, children under 16 in charge of a mother or stepmother or person standing *in loco parentis* are eligible for a grant of an unspecified amount but described as sufficient for the purpose. Under the law the grant is made by the juvenile or county court and supervision over administration of the Act is lodged in the State Pension Department. The counties are responsible for two-thirds of the grant, the remaining one-third coming from the State.

Colorado Under the laws of Colorado, children under 18 years of age in charge of parent or parents, poor and unable properly to care for the children, are eligible for grants sufficient to enable the parents properly to care for them, on application to county juvenile courts. This relief is under the general supervision of the State Public Welfare Department and the funds are to be provided by the counties.

California Under the laws of California, children 16 years of age and in charge of parents or persons normally caring for the child, whether orphaned, half orphaned, abandoned, or otherwise deprived of parental support, are eligible for an allowance to a maximum amount of \$120 a year from county or city boards of public welfare, or at the discretion of the children's agents of the State Department of Social Welfare. This \$120 grant is subject to reimbursement by the State through the Department of Social Welfare and may be increased by an equal sum at the expense of the county or town asking such action.

This foreshortened description gives a general idea of the variety of legislation covering this particular matter. Under the Social Security Act (Public, 271, 74th Congress) it is purposed to secure as much uniformity in it as is possible. Among the Federal requirements are that the State plan be State-wide, and, if administered by political subdivisions be mandatory upon them. Financial participation by the State must be provided in the State plan, and a single State agency must be charged with the administration and supervision of the activity. An additional significant provision is that the State residence requirement may not be such as to deny aid to any child residing in the State and who has resided therein for one year immediately preceding the application for aid.

Legislation. A review of the legislative acts having to do with children during 1934, made by the Children's Bureau of the U.S. Department of Labor, revealed that relatively little attention was devoted to children's problems during the year. Among the subjects which were acted upon were the laws increasing the penalty for kidnaping and similar offenses in Massachusetts, Ohio, South Carolina, Virginia, Washington, and West Virginia. Wisconsin raised from 16 to 17 the minimum age at which unaccompanied children may attend public dances; while Iowa, Kansas, and Michigan liberalized allowances for maternal and child

health in the case of indigent persons. A number of States also passed legislation having to do with adopted children, generally seeking to regularize and make a proper record of the action and to control the placement and adoption by requiring that child placing agencies and maternity homes be licensed and subject to supervision. In connection with the maternity homes, several States passed laws prohibiting advertising children for adoption or placing, and three States prohibited such activity entirely.

National Youth Programme. The general recognition on the part of the relief authorities of the inadequacy of relief allowances, as instanced by such reports as that made to the Mayor of New York City by a special investigatory committee, had not led to any material change in the size of the allowances, since all gains in appropriations have, in effect, been canceled by the constantly increasing number of persons applying for aid. However, outside of the immediate home relief field, considerable attention has been paid to the problems of youth, including the continuation and enlargement of the Civilian Conservation Corps and the establishment of the National Youth Administration. The National Youth Administration, an institution established under the so-called Works Program of 1935, took as its chief task the subvention of needy students already registered in high schools, colleges, and universities. It also made a grant of funds for the support of apprentices in charge of the regular national service in this field. The N.Y.A. grants were, according to the admission of the Administrator of this organization, Mr. Aubrey Williams, not only inadequate in amount, but were insufficient in number properly to meet the problem.

Under the Works Program, the CCC was markedly expanded, the objective being the enlistment of 600,000 boys, or double the number absorbed by the programme in its earlier phases. The work done by the boys will remain essentially what it was in its earlier phases, which is to say, that it will consist of soil erosion prevention, the planting of trees on areas designated for reforestation, the fighting of tree-destroying diseases, the building of forest trails, the digging of mosquito-control ditches, and so on. This phase of the relief programme has, according to official statements, won more general approval than any other. The criticism to which it has been subjected, and which has had official recognition, has been chiefly of its semi-military phases. While in official intent an effort to provide a healthy environment for youths from relief families, and useful work for them to do under disciplinary conditions intended to be liberal, the fact that the camps established have been in charge of military men designated by the War Department, has aroused some suspicion. A sympathetic critic, Jonathan Mitchell, has written in the *New Republic* for June 12, 1935.

Most people who have had anything to do with the CCC wish it to be made permanent, and talk of William James' moral equivalent of war. Nevertheless democratic institutions are probably best preserved when adolescent youths remain within the family system, and woo girls of their own fancy and plan for families of their own. Camps might perhaps be founded by the Government for boys who wish to make forestry a career. With this exception, the less this country does to prolong the gang age of its youth the better.

Nevertheless, this statement overlooks the fact that studies of demobilized CCC boys, made at the request of the CCC administration by the Federal Emergency Relief Administration, indicate that while some preference is given to such boys by

private employers, their experience in obtaining jobs has not been materially better than those of boys in general. This is simply to say, that while, on the one hand, the CCC camps are obviously no final solution for the problem of unemployed youths in that they are blind alleys, neither is there much evidence that the young can expect to be freely absorbed into normal employment in the immediate future.

Unemployed Youth. This brings to the fore the fact that, as the National Industrial Conference Board pointed out during the year, there is an annual net increase of approximately 320,000 new workers per year, or in the six years of the depression an increase of close to 2,000,000 individuals.

The problem of an unemployed youth is worldwide. According to a study released by the International Labor Office, one-fourth of the unemployed in Germany in 1932 and in Denmark in 1933, and one-third of those in Sweden in 1933, were under 25. The German figures total 1,750,000. Italy in the same year had 250,000 unemployed under 18, and Great Britain in May, 1933, had 140,000 under that age. In the light of this it is interesting to note that considerable attention has been concentrated on special projects for the young unemployed. This included vocational guidance, vocational training, and voluntary work service. In an attempt to control the situation, also, efforts have been made quite generally to raise the compulsory school age and the minimum working age.

The experiment in vocational guidance has been elaborate in England and Germany, and has been chiefly organized around the effort to introduce new workers to industrial processes through visits to actual operating establishments, the use of motion pictures, and so on, with the idea of facilitating choice of employment. This technique has been used because of the discovery by specialists, that many unemployed youths lack any notion of what they wish to do should work be offered. They thus tend to become casual laborers. Vocational guidance has also been made necessary by the fact that there are observable abnormal trends of interest in given occupations, some of which are known by statistical analysis to be overcrowded already. In this connection it should be noted that European countries have a more exact knowledge of this subject than is available in the United States. With regard to vocational training the emphasis has been placed upon domestic service and agriculture in recent years, the feeling being that the former is at least a preparation for possible future marriage, while the latter is in line with "back to the soil" movement which is common in Europe to-day.

It should be pointed out that an integral part of youth activities—though perhaps dubiously child welfare activities—are such movements as that in Germany to organize young people, male and female, into labor groups for work in agriculture and on the public roads, the professed objective being the democratization of youth in Fascist terms, though more candid spokesmen for the Government have admitted that, in the case of boys, it is a preliminary "toughening" process looking toward their period of military service. In this connection it should be observed that in an effort to redistribute employment, young unmarried workers have been deprived of their jobs by decree and replaced by older married workers. In Italy the same organization of youth into formal Fascist youth organizations is going on. The equivalent movement in Soviet Russia, the young communist organizations,

is only similar by analogy, the intent being different: The imbuing of the youth with the general idea of social welfare, and a high conception of the service of the masses by the individual.

CHILE, ché'la, or chil'i. A South American republic. Capital, Santiago.

Area and Population. Chile has an area of 285,133 square miles and a population estimated on Jan. 1, 1935, at 4,465,000 (4,287,445 at the 1930 census). The leading cities, with their 1930 census populations, were: Santiago, 696,231; Valparaíso, 193,205; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458. The population is predominantly European. Living births in 1934 numbered 150,362 (147,723 in 1933); deaths, 119,080 (118,432); marriages, 31,017 (29,562).

Education. Elementary education is free and compulsory for children between 7 and 15. In 1933 there were 487,751 pupils in 4060 public and private primary schools; 950 students in 7 normal schools; 37,505 pupils in 206 secondary schools, and 3517 pupils in 11 public commercial schools. For higher education there were the State University, the Catholic University, and the National Institute at Santiago and the University of Concepción, besides various professional and vocational schools.

Production. Of the working population in 1930, 37.8 per cent were engaged in agriculture and 22.1 per cent in industry. The position of agriculture improved markedly in 1934, the crops being good and exports 63 per cent greater in value than in 1933. The 1933-34 crops included (in metric tons): Wheat, 960,900; barley, 146,400; oats, 114,400; potatoes, 611,300. Corn production in 1932-33 was 82,500 metric tons; wine in 1933-34, 3,200,000 hectoliters; tobacco (1932), 10,212,140 lb. The 1934 wool clip was 15,400 metric tons. There were 2,462,730 cattle in 1935 (2,387,940 in 1930).

Minerals normally account for about 85 per cent of the value of all exports. Exports of nitrate, long the dominant factor in Chilean economy, increased to 1,256,000 metric tons in 1934 from 669,000 in 1933. The value of 1934 nitrate shipments was 140,538,000 gold pesos (85,000,000 in 1933). Output of other minerals in 1934 was (in metric tons): Copper, 256,700 (163,400 in 1933); coal, 1,804,000 (1,538,000); iron ore, 973,000 (565,000). The 1934 gold production was 7420 kilograms (4584 in 1933); silver, 32,750 kilograms (7750 in 1933). The expansion of Chilean industry continued at a rapid rate during 1934, with many new lines being established.

Foreign Trade. Imports in 1934 were valued at 241,600,000 gold pesos (181,600,000 in 1933) and exports at 496,600,000 gold pesos (344,000,000 in 1933). Imports increased 33 per cent in value over 1933; exports, 44.4 per cent. The United States supplied 28.8 per cent of the 1934 imports (22.5 in 1933); Great Britain, 23.2 per cent (12.2); Germany, 10.2 (11.4); and Peru, 8.8 (14.2). Of the total exports, Great Britain took 22.8 per cent (24.8 in 1933); United States, 20.9 per cent (17.0); and Germany, 5 (6.7). The value of the principal 1934 exports was (in 1000 gold pesos): Copper bars, 183,623; sodium nitrate, 140,538; wool, 32,049; gold ores, 8937; iodine, 9011; untanned hides, 8104; barley, 8007. Sugar, wheat, textiles, fuel oil, etc., were the principal import items.

United States statistics showed imports from Chile in 1935 of \$24,091,023 (\$22,909,616 in 1934) and exports to Chile of \$15,948,889 (\$12,030,334 in 1934).

Finance. According to the report of the Comptroller General, dated Feb. 1, 1935, ordinary budget

receipts during 1934 totaled 1,043,000,000 pesos and expenditures 974,900,000 pesos, leaving a surplus of 68,100,000 pesos. Comparative returns for 1933 were: Receipts, 945,959,167 pesos; expenditures, 944,127,513 pesos; surplus, 1,831,654 pesos. Both the 1933 and 1934 figures exclude the extraordinary budget and appropriations under special laws, which amounted to 141,600,000 pesos in 1933. Actual preliminary budget returns for 1935 were: Receipts, 1,380,000,000 pesos; expenditures, 1,280,000,000 pesos. The 1936 estimates balanced at 1,291,000,000 pesos.

The public debt as of Dec. 31, 1934, totaled 5,318,801,639 pesos, against 5,372,117,146 pesos on Dec. 31, 1933. The gold peso exchanged at \$0.1217 in 1932, \$0.15 in 1933, and \$0.2063 in 1934.

Communications. Chile in 1935 had a little over 5500 miles of railway lines, of which about 3600 miles were state owned and operated. A new railway from Antofagasta, Chile, to Salta, Argentina, was begun in 1935. The Chilean section of the Transandean Ry., operated as a private line since 1910, was incorporated in the state system in August, 1934, due to financial difficulties. The state lines reported a deficit of 11,000,000 pesos in 1934, but this included a contribution of 19,000,000 pesos made to the government. Operating receipts were 8,000,000 pesos more than actual operating expenditures. Highways totaled 25,000 miles, including about 16,000 miles fit for motor traffic. Air lines connect Santiago with the chief Chilean cities and with the inter-American air network. The regular air service maintained by the Junkers company between Berlin and Rio de Janeiro was extended to Santiago, Chile, in October, 1935. The net register tonnage of overseas shipping entering the ports with cargo in 1934 was 1,491,000 (1,298,000 in 1933); tonnage cleared, 1,839,000 (1,450,000 in 1933). The Chilean merchant marine in December, 1934, consisted of 108 ships of 146,752 registered tons.

Government. By the 1935 Constitution, executive power is vested in a President, aided by a cabinet responsible to him. The legislative function is exercised by a National Congress, consisting of a Senate of 45 members elected for eight years and renewed by halves every four years, and a Chamber of Deputies of 142 members elected for four years by departments. The President, chosen for six years by direct popular vote, is ineligible to succeed himself. President in 1935, Arturo Alessandri, who assumed office Dec. 24, 1932.

HISTORY

Political Trends. Chile's progress in both the political and economic fields was continued during 1935. The revival of economic activity, which first became apparent in 1933, gained added momentum. The index of industrial activity (Base: 1929 equals 100) increased from 95.8 for 1933 to 105.1 for 1934 and to 119 for the year 1935. The general improvement in almost all lines of business was accompanied by the further stabilization of the internal political situation. The astonishing series of revolutions which racked the Chilean body politic during 1931-33 was apparently ended, and the political parties resumed their customary manoeuvring and bickering within the constitutional sphere. The sweep of communistic and ultra-radical propaganda, which had threatened to overwhelm the powerful land-owning aristocracy and the middle class, appeared to have been definitely checked.

With the decline of the radical menace, the coal-

tion of the conservative and liberal parties upon which President Alessandri's power rested began to disintegrate. The Radical party, which had the largest representation in the Chamber of Deputies (37 out of 142 seats), went over into the Opposition early in the year. The party's decision to file charges against Minister of the Interior Luis Salas Romo led the President about February 15 to prorogue the extraordinary session of Congress. Fears that another period of political confusion was impending were set at rest on March 21 when the Conservative, Democratic, and Liberal parties, controlling a majority of one in the Chamber, formed a bloc to support the Alessandri administration.

The new bloc's programme, designed to eliminate social unrest among Chile's large propertyless working classes, called for government support of new fishing and other enterprises, the construction of hygienic but economical houses for the needy, and the reduction of tariff rates on many articles consumed by the masses.

The agricultural colonization law, promulgated Feb. 16, 1935, was an important step in the same direction. It provided an Agricultural Colonization Fund, operated through an autonomous institution capitalized at 100,000,000 pesos, to acquire farm lands through direct purchase, public auction, or even expropriation, for settlement by the landless and unemployed. Landed estates not kept in a reasonable state of production were declared subject to expropriation at a price not to exceed 10 per cent of the assessed value. The President was authorized to transfer to the Colonization Fund such public lands as he considered desirable for settlement. The lands acquired were to be distributed in tracts ranging from 4 to 500 hectares (hectare equals 2.47 acres). The value of each farm, including a home, was not to exceed 50,000 pesos. Settlers were to receive full title to their tracts upon payment of 5 to 10 per cent of the purchase price, with generous repayment provisions. The President was authorized to float an internal loan of not more than 300,000,000 pesos to finance the plan.

Another law of July 26 granted a 25 per cent increase in salaries of government employees for the years 1935 and 1936, thus increasing the budget by about 42,000,000 pesos annually. Autonomy of the municipalities was restored throughout Chile simultaneously with the municipal elections of April 7. Under a law adopted in 1934, literate females over 21 years of age and all foreigners who had resided in a municipal area for five consecutive years were permitted to vote in the municipal elections.

A proposal for nationalization of all electric utilities and industries in Chile, under consideration by Congress, received a strong impetus from the lawsuit brought by the Fiscal Defense Council on behalf of the government against the Chilean Electric Company, a subsidiary of the Electric Bond and Share Company of New York. The company was charged late in October with violating the laws restricting the purchase and exportation of foreign currencies. On November 28 it was reported that a settlement had been reached, the company having accepted closer Chilean control.

Congress was convoked in extraordinary session at the end of October by President Alessandri to consider the 1936 budget, determine the date for the next election, and pass upon government bills for the extension of the land distribution programme and additional social welfare projects. A

law proclaimed November 7, designed to check fast-growing Fascist and Communist semi-military organization, prohibited the wearing of distinctive insignia and uniforms in public. However the Chilean Supreme Court on November 20 declared this law unconstitutional. Jorge González, leader of the Chilean Nazis, was sentenced to prison for 61 days on November 12 following his conviction on a charge of libeling the editor of *La Nación*. On November 28 the next parliamentary elections were set for March, 1937.

The international agreement, regulating the production of both natural and synthetic nitrate, was extended for three years from July 1, 1935, through a pact ratified in London on September 9. Chile was authorized to market between 1,000,000 and 1,250,000 tons of nitrate annually for three years. It was estimated that the agreement would bring Chile a gross profit of £2,500,000 during the season ending in June, 1936.

Financial Problems. The Exchange Control Commission continued its activities, as the expansion of Chilean exports did not yet suffice to meet all Chile's requirements for foreign exchange. American frozen credits in Chile as of Aug. 1, 1935, were estimated at 57,000,000 pesos, the government having granted no exchange for the liquidation of these credits. On Jan. 31, 1935, the government decreed the partial resumption of payments upon the defaulted foreign debt. The decree allotted government revenues from the Nitrate and Iodine Sales Corp. and from taxes on the copper mines to the Public Debt Amortization Bureau for disbursements on the public debt, thus making the amount available for service of the debt dependent upon foreign purchases of nitrate, iodine, and copper. The sums available in 1935 permitted the payment of interest at the rate of about $\frac{1}{2}$ of 1 per cent. Foreign bondholders accepting this sum automatically relinquished all claims to further interest payments on coupons on which the reduced interest had been paid. This and other features of the scheme aroused much protest among foreign bondholders. Late in February a Chilean financial mission arrived in the United States to promote the acceptance of the plan. Negotiations were still proceeding at the end of the year. As of Dec. 31, 1934, all of the \$264,608,500 in bonds of the Chilean Government and its subdivisions held in the United States were in default in both interest and sinking fund payments.

Foreign Affairs. One of the most interesting developments of the Chaco War was the manner in which Chilean public and governmental sentiment, at first overwhelmingly favorable to Paraguay, gradually swung over to the Bolivian side. In 1935 the Bolivian-Chilean rapprochement had gone to such lengths that there was talk of the formation of a Pacific bloc, including Chile, Bolivia, and Peru, in opposition to Argentina and Paraguay. Such a movement was actively promoted by the Bolivian Foreign Office.

Chile had watched Argentine policy in the Chaco struggle with increasing suspicion, fearing that the net result would be the extension of Argentine economic, if not political, control over the disputed territory. This latent irritation was exposed in March when Argentine protests at the Chilean Peruvian economic accord of 1934, accompanied by threats of reprisals if the treaty was ratified, provoked sharp criticism of Argentina's Chaco policy from both President Alessandri and the influential Augustin Edwards, former Chilean Ambassador to Great Britain. Immediately afterwards

President Alessandri announced that the time was not ripe for the Argentine President's projected visit to Chile, a visit which had been suggested by the Chilean Government itself.

Despite this outburst, cordial relations with Argentina were soon reestablished and the Chilean Foreign Office participated actively in the negotiations which led to the truce of June 12, 1935, between Bolivia and Paraguay. Chile did not abandon its commercial treaty with Peru, which was ratified Nov. 16, 1935. Instead Chile's rapprochement with its old enemy in the War of the Pacific was carried still further by the signing on July 6, 1935, of six conventions, regulating the civil rights of their respective nationals, propaganda, and census methods, and providing for the exchange of university professors and students. On July 2, at Buenos Aires, Chile signed 10 bilateral conventions with Argentina. See ARGENTINA, BOLIVIA, and PERU under *History*.

CHINA. A republic of eastern Asia. Capital, Nanking.

Area and Population. With an area estimated at 4,314,097 square miles, or roughly equal to that of the United States and Mexico combined, China and its dependencies contain about one-fourth of the world's population, or roughly 450,000,000 people. These estimates include regions such as Outer Mongolia, Manchuria, and Tibet, over which China no longer exercises actual control. (See MANCHOUKUO, MONGOLIA, and TIBET.) For the estimated area and population of the Chinese provinces in 1930, see the 1934 NEW INTERNATIONAL YEAR BOOK, p. 142.) Estimated populations of the chief cities in 1931 were: Shanghai, including suburbs, 3,259,114; Tientsin, 1,387,462; Canton, 861,024; Hankow, 777,993; Chungking, 635,000; Nanking, 633,452; Wenchow, 631,276; Changsha, 606,972; Hangchow, 506,930; Weihaiwei, 390,337; Foochow, 322,725; Soochow, 260,000; Amoy, 234,159; Ningpo, 218,774; Wanhhsien, 201,837; Chinkiang, 199,776. The number of Chinese residing abroad was estimated in 1934 at 11,393,636, including 3,400,000 in Formosa, 2,000,000 in British Malaya, and 1,233,855 in Netherland India.

Buddhism, Taoism, and Confucianism are the predominant religions. There are also about 20,000,000 Mohammedans, 2,486,000 Roman Catholics, and 807,000 Protestants.

Education. Illiteracy in China is widespread. In 1932 there were 190,985 kindergartens and elementary schools, with 7,937,558 pupils and 407,044 teachers. Middle schools numbered 2337, including 1475 public schools with about 515,000 pupils. There were 52 universities in 1933 (14 national, 13 provincial, and 25 private) and the attendance in 1931 was 25,018. In 1933, 621 Chinese students were attending foreign universities.

Production. About 80 per cent of the population is engaged in agriculture. China ranks first in the production of rice, soy beans, tea, kaoliang, sweet potatoes, millet, and vegetable oil, second in the production of raw silk, and about third in the production of wheat and cotton. Sugarcane culture has made rapid progress in Kwangtung and Kwangsi Provinces. There are no accurate production statistics, but official estimates for 1933 were as follows (in metric tons): Wheat, 23,795,000; rice, 52,072,000; soy beans, 9,993,000; barley, 6,381,000; corn, 6,931,000; ground-nuts, 2,615,600; tobacco, 208,000; hemp, 110,600; linseed, 53,500. Cotton production in 1934-35 was estimated at 2,800,000 bales (of 478 lb. net). Exports of raw silk in 1934 were estimated at 3,127,000 metric tons.

China is also the world's leading exporter of eggs and pigs' bristles. Livestock estimates for 1933 were: Swine, 94,343,894; cows and buffaloes, 22,246,555; goats and sheep, 19,418,241; horses, 6,089,463.

A leading producer of antimony, tin, tungsten, and manganese, China also has extensive coal and iron deposits and commercially important supplies of salt, petroleum, wolfram, molybdenum, bismuth, gold, and silver. The latest mining and metallurgical production figures, excluding Manchuria, are (in metric tons): Coal, 18,685,000 (1932); coke, 18,000 (1933); manganese ore, 9600 (exports, 1933); iron ore, 1,300,000 (1932); pig iron, 115,000 (1932); steel ingots and castings, 15,000 (1931); lead, 3100 (1932); zinc, 4400 (1932); tin, 7700 (1934).

Manufacturing in China has undergone a steady expansion. The cotton textile industry is the most highly developed. In 1934 there were 127 modern cotton spinning and weaving plants, with a total of about 4,500,000 spindles and 42,000 looms. The annual production of these mills averaged about 2,250,000 bales of cotton yarn and nearly 23,500,000 pieces (of 40 yards each) of cotton cloth. In 1934 the mills consumed about 2,150,000 bales of raw cotton. There were also some 91 flour mills, 400 glass factories, 518 electrical factories, 11 cement works, 104 tanning factories, as well as iron foundries, shipyards, railway shops, cigarette factories, silk filatures and looms, rubber-shoe factories, and printing and publishing plants.

Foreign Trade. Excluding Manchuria, China's imports in 1934 were valued at 1,029,665,000 yuan (1,345,567,000 yuan in 1933) and exports at 535,214,000 yuan (611,828,000 yuan in 1933). The United States in 1934 continued to hold first place in China's import and export trade. The American share of China's imports, 26.16 per cent, was more than twice that of Japan and Great Britain, with 12.21 and 12 per cent, respectively, and nearly three times that of Germany, with 8.99 per cent. Of China's total exports, the United States bought 17.63 per cent, compared with Japan's 15.16 per cent, Great Britain's 9.30 per cent, and Germany's 3.58 per cent. Metals and ores, raw cotton and yarn, machinery, chemicals, wool and woolen goods, dyes and paints, tobacco, and cotton piece goods are leading imports. The chief exports, in order of their 1934 values, were: Animal products; tea; oil, tallow, and wax; metals and minerals; cotton piece goods; oil seeds; hides, skins, and leather; and raw silk.

Imports in 1935, excluding precious metals, totaled about 919,000,000 yuan and exports were 576,000,000 yuan. The United States supplied 17 per cent and Japan 15 per cent of the imports, while the United States took 23.7 per cent and Japan 14 per cent of the exports. United States statistics for 1935 showed general imports from China of \$64,164,486 (\$43,932,503 in 1934) and exports to China, including reexports, of \$38,156,292 (\$68,666,930 in 1934).

Finance. The budget of the Central Government at Nanking for the fiscal year ending June 30, 1936, as adopted by the Legislative Yuan, balanced at 957,000,000 yuan. The chief expenditure items were (in millions of yuan): Military, 321; loan service obligations, 275; subsidies, 102. According to the Ministry of Finance there was a deficit of 86,000,000 yuan on total receipts of 672,000,000 yuan in 1932-33 and a deficit of 147,000,000 yuan on total receipts of 829,000,000 yuan in 1933-34.

The consolidated public debt of the Central

Government outstanding on Jan 1, 1934, was distributed as follows: Internal, 816,003,845 silver dollars; external, £17,781,952, 75,600,000 yen, 52,366,975 francs, 137,743,000 Belgian francs, 30,750,000 guilders, 2,334,598 U.S. dollars, and 8,645,425 silver dollars (yuan). Abolition of the tael as a unit of currency in 1933 left the silver dollar (yuan) as the exchange unit. The yuan, with no fixed par value, exchanged at an average of \$0.2860 in 1933, \$0.3409 in 1934, and \$0.3657 in 1935.

Communications. The modernization of China's antiquated system of communication and transportation proceeded at a rapid pace during 1934 and 1935, despite the country's political and economic difficulties. During 1934 more new railway construction was completed or undertaken than in any year during the previous 20-year period. The Lunghai Ry. of North Central China was extended to Sian, capital of Shensi Province. Operations were resumed on the Peiping-Mukden line for the first time since 1931. Work was approaching completion on the Hankow-Canton and Hangchow-Ningpo lines and on other lines connecting Shanghai with the Hankow-Canton lines and linking Nanking with Foochow. Other railway lines projected or in preliminary stages of construction were: Chungking-Chengtu, Nanchang-Pingsiang, Canton-Hohsien, Chengtu-Sian, Sian-Lanchow, Samshui-Wuchow. Development of the new port of Lien-Yan-Kang, eastern terminus on the Yellow Sea of the Lunghai Ry., also was progressing.

Highway construction was proceeding much more actively than railway building. During 1934 the Central Government constructed about 2500 miles of surfaced roads and 4000 miles of dirt roads. An additional 10,000 miles of new highways were constructed by provincial authorities, bringing the total highway mileage suitable for motor traffic to 50,000 miles. Aviation also made remarkable progress. Commercial lines in operation at the beginning of 1935 aggregated more than 6800 miles, of which nearly 4000 miles were operated by a Chino-American company using American planes and pilots. In August, 1935, the Canton-Hainan air line was extended to Nanchang, capital of Kwangsi Province. The Chinese Radio Administration inaugurated domestic radio-telephone service on Oct. 10, 1935; subsequently radio-telephone connections with Japan, the United States, and Europe were established. A 10,000,000-yuan loan for improvement of the telephone and telegraph systems was approved by the Executive Yuan in 1935. During 1934 a total of 72,913 vessels of 44,918,927 register tons entered and cleared the ports in the overseas trade. The rivers and canals still remain the principal means of transport in the interior.

Government. The Nanking or Nationalist Government, which in 1935 had control of a large part of Central China and the lower Yangtze valley, represented a Kuomintang (Nationalist party) dictatorship. Executive control, however, rested mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nationalist armies. Pending the projected establishment of representative government, governmental functions were carried on by means of a committee system (for description, see 1932 YEAR BOOK). The chairman of the State Council and nominal head of the government in 1935 was Lin Sen. The chairmen of the five yuan (committees) of the government were: Executive, Wang Ching-wei; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-t'ao; Control, Yu Yu-jen. The chairman of the Execu-

tive Yuan was assisted by nine cabinet ministers, as follows: Interior, Huang Fu; Foreign Affairs, Wang Ching-wei (acting); Military Affairs, Ho Ying-ch'in; Navy, Ch'en Shao-k'uan; Finance, Dr. H. H. Kung; Industries, Chen Kung-po; Railways, Ku Meng-yü; Communications, Chu Chia-hwa; Education, Wang Shih-chieh. For changes in 1935, see under *History*.

HISTORY

Japan in North China. The groundwork for the establishment of a Japanese protectorate over all of China proper was laid during 1935 through a judicious mixture of Nipponese diplomacy and armed force. During the years 1931-34 Japan had torn Manchuria and Jehol Province in Inner Mongolia from China and consolidated its position there through the creation of the puppet state of Manchoukuo (q.v.). The former Manchu "boy emperor" of China had been elevated to the Manchoukuo throne at Hsinking, with the intimation that he was destined eventually to rule a much larger empire from his former capital at Peiping (Peking). In 1935 the Japanese moved south of the Great Wall and partially detached Hopei Province in China proper and Chahar in Inner Mongolia from the Nanking Government's control.

Chinese passive resistance managed to stave off temporarily the incorporation of Shantung, Shansi, and Suiyuan Provinces with Hopei and Chahar in a projected North China "autonomous region" under Japanese protection. But it was admitted by Japanese and Chinese spokesmen alike that these important provinces would follow Hopei and Chahar into the maw of the Nipponese military machine soon, and that the rest of China would follow in due course. Working through native "autonomy movements," the Japanese at the close of 1935 were also extending their military control into Ningsia Province in the western part of Inner Mongolia and were battering at the doors of Outer Mongolia, long under Soviet protection.

Thus the situation in the Far East closely resembled that of 1915, when Japan, taking advantage of the capture of German Kiaochow and the absorption of the other powers in the World War, induced the Chinese government by threats and bribery to accept a virtual Japanese protectorate in the form of the notorious Twenty-One Demands—demands which were withdrawn at the insistence of the powers after the War. In 1935, with Europe engrossed in the Italo-Ethiopian conflict and German rearmament, the military clique dominating Japan considered the time ripe for the further development of their plans for Far Eastern hegemony. They played boldly and skillfully for stakes of the highest importance—the exclusive control of the great Chinese market, the profitable exploitation of China's rich natural resources, and, even more vital, the establishment of strategically favorable positions for the coming war with Soviet Russia. Convinced that the conflict with the Russian colossus could not long be postponed, the Nipponese generals strove to outflank Soviet Siberia in advance by establishing military control over both Inner and Outer Mongolia. A secondary but related Japanese objective in Mongolia was to check the spread of communism into Manchuria and North China and to isolate Communist-controlled areas in central and western China from the Soviet Union and sovietized Outer Mongolia.

Avoiding the appearances of outright aggression, the Japanese carried through their policy in

China largely by indirection. Unofficially they offered the Nanking Government the choice of having Northern China seized by armed force or of accepting the following minimum Japanese demands,—suppression of anti-Japanese agitation and boycotts, acceptance of Japanese cooperation in economic matters, and prevention, with Japanese aid if necessary, of the spread of communism from Mongolia. The events of 1931-34 in Manchuria, Jehol, and North China had demonstrated China's helplessness against the Japanese Empire's armed might. Rather than present Japan with an excuse for outright annexation of territory, the Nanking Government under Gen. Chiang Kai-shek capitulated to these demands in principle, while seeking by subterfuge and evasion to yield as little as possible. The formula by which the Japanese achieved their successive advances against Chinese obstruction was explained by Nathaniel Peffer in the *New York Times* (Oct. 20, 1935) as follows:

True to its military traditions, Japan uses an almost classical strategy in its dealings with China. First there are diplomatic reconnaissances in the form of complaints of China's "insincerity" or "unfairness to Japan's interests." Then there are preliminary skirmishes in the form of warnings that China's conduct may lead to unfortunate incidents. Then there are incidents followed by more direct warnings.

There follow minor clashes which always come about at opportune moments. And then there are manœuvres in the form of more or less secret and always indirect demands on the Chinese Government. Then Japan moves forward into the diplomatic and military area marked out for itself although it is never openly avowed. There follows a lull in which Japan is engaged in consolidating its gains, after which a new cycle begins.

Following this regular pattern of procedure, 4000 Japanese and Manchoukuoan troops late in January, 1935, seized some 700 square miles of territory in southeastern Chahar and incorporated it into Manchoukuo. The next move of the Japanese forces in Manchuria, known as the Kwantung Army, was to send troops southward from the Great Wall into the demilitarized area extending to within a few miles of Peiping and Tientsin, established under the Tangku Truce of May 31, 1933 (see 1933 YEAR BOOK, p. 395). The excuse offered for this invasion was that Chinese irregulars had entered the zone and threatened the peace of Jehol. The Japanese troops failed to withdraw after the "disorderly elements" were crushed. Instead on May 29 the Kwantung Army—apparently without consulting the Tokyo Foreign Office—presented a new series of demands backed by the threat to occupy Peiping and Tientsin. This virtual ultimatum called for the evacuation of the Peiping-Tientsin region by Chinese troops, elimination of all government officials in North China who were hostile to Japan, closing of the Kuomintang (Chinese Nationalist Party) branches and offices in North China, suppression of anti-Japanese organizations in North China, and elimination of anti-Japanese propaganda from the Chinese schools and all books. The terms were accepted by the Nanking authorities on June 12.

Penetration of Mongolia. Coincidentally the overnight detention of four Japanese agents in Chahar Province on June 5 led to related demands with respect to that region which were accepted by the Chinese on June 27. This agreement secured for the Japanese a guarantee of safe and unhindered travel in Chahar, dissolution of Kuomintang branches there, cessation of Chinese emigration into eastern Chahar, removal of Chinese troops from Changpei on the Kalgan-Urga caravan routes, and the establishment of a new

demilitarized area in eastern Chahar. Following this settlement the Japanese rapidly extended their control over Chahar. The existing influence exercised by a Japanese military mission at Kalgan, the most important strategic point in Inner Mongolia, was reinforced by the appointment of military and civil advisers to the Chahar government in July. These steps were the prelude to the occupation of Kalgan by Japanese troops on December 14. Meanwhile the Nipponese had utilized their new foothold in Chahar to exert steady pressure upon the autonomous Mongol government, established in part of Inner Mongolia in 1934, to accept incorporation in Manchoukuo. The Japanese further demanded that the Mongol leaders at Pailingmiao (the Mongol capital in Suiyuan Province) accept Japanese advisers and agree to the erection of a wireless station. The pressure of the Kwantung Army again proved effective, and on December 23 Prince Teh, a leader in the Mongol autonomy movement, proclaimed the independence from China of the western part of Inner Mongolia, including large parts of Suiyuan and Ningsia Provinces. During the same months, the Japanese, acting ostensibly for the Manchoukuo government, were attempting to force their way into the eastern part of Outer Mongolia (see *MONGOLIA and JAPAN under History*).

"Autonomy" in North China. With the acceptance by Nanking of the Japanese demands regarding North China on June 12, the Nipponese began actively to lay the groundwork for the establishment of a five-province autonomous administration under Japanese supervision. The next step would be the proclamation of the autonomous area as an independent state and possibly its incorporation in Manchoukuo. Throughout June the troops controlled by Gen. Chiang Kai-shek were withdrawn from Chahar, Suiyuan, Shansi, Hopei, and Shantung Provinces. Nanking officials resigned and were replaced by Chinese acceptable to the Kwantung Army. Anti-Japanese statements were eliminated from the press. The Kuomintang branches, the Chinese Fascists (Blue Shirts) organized by Chiang Kai-shek, and other influential persons known to be loyal to the central government were forced out or driven underground. They were replaced by officials owing allegiance to Yen Hsi-shan, so-called "model Governor" of Shansi Province, and an old enemy of Chiang's, or to other provincial governors who were regarded as luke-warm in their loyalty to Nanking. It was expected that under the proper financial inducement and armed pressure, Yen Hsi-shan, Governor Han Fu-chu of Shantung, the former "Christian General" Feng Yu-hsiang, and other North China militarists would take the lead in severing North China from Nanking.

In anticipation of this, the Japanese announced plans for the development of an air service linking Peiping and Tientsin with Manchoukuo. They declared that the secret terms of the Tangku Truce of 1933 gave them the right to develop all forms of communications and transportation facilities in China, a claim which was officially denied at Nanking. Japanese business men began to invade the Peiping-Tientsin region in increasing numbers, with plans for extending the market for Japanese goods and for the exploitation of its resources. A subsidiary of the South Manchuria Railway was established to engage in financial, commercial, and other economic activities in North China.

The Japanese plans for an autonomous North

China, however, encountered unexpected obstacles. From September on Japanese spokesmen repeatedly complained that China's promises were not being kept. On September 10 Maj. Gen. Kensuke Isogai, Military Attaché to the Japanese Embassy at Nanking, warned that "the entire political and military situation in North China is unsatisfactory and if not improved at an early date in accordance with the Chinese pledges of last June the Japanese Army must necessarily take appropriate action." These threats were accompanied by the appearance of Japanese gunboats and destroyers at Swatow in South China and at Hankow on the Yangtse to repress alleged anti-Japanese activities. The Japanese spokesmen assumed a menacing attitude towards Chiang Kai-shek, whom they charged with frustrating Sino-Japanese cooperation; at the same time Chiang was vigorously denounced by patriotic Chinese for his seeming pro-Japanese policy. Chiang was obliged to steer an increasingly tortuous course, taking care not to provoke the Japanese to a large scale invasion of China and at the same time not to unite the internal opposition to his régime by yielding too much to the Japanese. But as the year drew to a close, mass Chinese opposition to Chiang's policy of non-resistance gained strength rapidly under the leadership of student nationalist organizations and prevented, temporarily at least, the consummation of Japan's plans in North China.

The attempted assassination of Premier Wang Ching-wei on November 1 was an indication of the growing intransigence of Chinese patriotic sentiment. Wang was one of the foremost advocates of Sino-Japanese rapprochement. This attack, followed on November 3 by the Nanking Government's nationalization of silver and adoption of a managed paper currency without consulting Japan, gave the Japanese policy in China a further setback. Meanwhile at Swatow the Chinese successfully defied Japanese threats of armed intervention to stop the collection of taxes on rice imported from Formosa. Anti-Japanese riots broke out in Shanghai early in November. Strong sentiment for armed resistance to Japan was manifested at the Fifth Kuomintang Congress, which met at Nanking from November 12 to 24. The conference, significantly, was attended by Generals Yen Hsi-shan and Feng Yu-hsiang, upon whom the Japanese relied in part for carrying through their scheme for an autonomous North China.

Mobilizing several divisions of the Kwantung Army at Shanhaikuan the Japanese in the middle of November brought pressure upon the generals in North China to proclaim the autonomy of the five selected provinces during the week of November 18. Their plans miscarried badly, to the evident chagrin of Kwantung Army leaders, through the refusal of some of the key Chinese generals to play the rôle assigned to them. The latter were aided in their stand by Chiang Kai-shek's action in mobilizing 150,000 picked troops along the southern borders of the five Provinces. Contradictory policies and lack of cooperation between the Kwantung Army and the Foreign Office in Tokyo was apparently another factor in the failure of the autonomy plans. The autonomy proclamation finally issued on November 24 by Yin Ju-keng, a pro-Japanese official, was confined to 18 counties in northern Hopei and eastern Chahar in and near the demilitarized zone. The region contained about 4,000,000 inhabitants.

The Japanese were temporarily frustrated but

by no means discouraged. They immediately began to move troops southward from Shanhaikuan into the Peiping-Tientsin area. By December 1, 10,000 troops were concentrated there, in control of railway junctions and other strategic points. The Chinese again capitulated before this display of force. On December 7 Maj. Gen. Hayao Tada of the Kwantung Army, in conference with War Minister Ho Ying-ching of the Nanking régime, Gov. Hsiao Cheng-ying of Chahar and Gen. Sung Cheh-yuan, commander of the Peiping-Tientsin Chinese garrisons, agreed upon the establishment of a semi-autonomous régime including Chahar and Hopei Provinces only. Six days later the Nanking Government appointed Gen. Sung Cheh-yuan, head of the new Hopei-Chahar Political Council, as Governor of Hopei Province. The Hopei-Chahar Council, consisting of 17 northern Chinese leaders considered friendly to Japan, soon demonstrated that it was not prepared to extend the full cooperation desired by its Japanese sponsors. Thus the Chinese policy of alternate resistance and submission had saved for the time being three of the five provinces marked out for separation. Moreover the semi-autonomous régime in Hopei and Chahar reasserted its claim to administer the district declared autonomous under Yin Ju-keng on November 24. Japan, however, had succeeded in establishing itself more firmly in China proper and it was plain that the admittedly temporary arrangement was but the prelude to a further extension of Japanese control.

Japan's expansion from the limits obtained in the December 7 agreement was in full swing as the year ended. Rejecting the Hopei-Chahar Political Council's claim to administer Yin Ju-keng's district, the Japanese instigated the latter's forces to seize Tangku, the seaport of Tientsin, on December 16. It was immediately incorporated in the autonomous zone. With the formal installation of the Hopei-Chahar Council on December 18, the Kwantung Army's commander in North China formally warned Gen. Sung Cheh-yuan that his government was expected to accept Japanese guidance. General Sung, however, proved a none-too-pliable tool. Declining to accept Japanese orders on matters of policy and administration, he evaded specific demands by declaring he could not act without orders from Nanking. Thus the year closed with the Japanese in North China consolidating their position and laying the political and military foundation for another cycle of expansion.

Policies of Other Powers. Whereas the United States in 1932 had taken the lead in opposing Japan's conquest of Manchuria, in 1935 the British Government displayed major evidences of alarm as the Japanese expansion threatened the regions in North and Central China where British financial and commercial interests predominated. Early in 1935 a financial and economic crisis developed in China, largely as a result of the deflationary effect of the silver-buying policy of the United States Government, which threatened to throw China into Japan's arms. The British Government had rebuffed Nanking's overtures for a loan towards the end of 1934, but in March the British Foreign Office sounded out the governments of the United States, Japan, and France as to the possibility of a new international loan to assist China economically. Such a loan, incidentally, would have strengthened the hands of Nanking in dealing with Japan. Japan rejected the British proposal outright and it was dropped for the time

being. The crisis was met temporarily by an internal Chinese loan for 100,000,000 silver dollars.

Alarmed by the continuance of the Chinese economic crisis, the obstacle to British trade caused by depreciation of the silver dollar, and the effect of the American silver policy upon India, the British Government in September sent Sir Frederick Leith-Ross to China to study the situation and propose remedies. Although Sir Frederick stopped in Tokyo to consult Japanese leaders, the British initiative was received with ill grace in Japan. Japanese suspicion of British policy mounted when China on November 3 abandoned the silver standard and adopted a managed paper currency. Despite Sir Frederick Leith-Ross's denials, the indications were that he helped Chinese currency officials to frame the new policy, which coincided perfectly with British financial interests. Following the lines of his pronouncement of Apr. 18, 1934, that Japan would not tolerate interference with its Asiatic policy by the Western powers, the Foreign Office spokesman at Tokyo on November 25 warned Sir Frederick Leith-Ross not to obstruct the autonomy movement in North China. He also accused the London government of hampering Foreign Minister Koki Hirota's "conciliatory policy" towards China.

This statement coincided with the movement of Japanese troops into North China. The British Government on November 28 formally asked Japan to state its intentions in China and recalled Japan's obligation to respect China's integrity under the Nine-Power Treaty. On December 5 the American Secretary of State issued a warning that the United States was closely following developments in China and that it maintained its treaty rights in that country. The same day Sir Samuel Hoare, the British Foreign Secretary, issued a somewhat similar declaration in the House of Commons. The Japanese response indicated that they considered the Nine-Power Treaty as a dead letter. Despite the urgent representations of Chinese diplomats, neither Great Britain, the United States, or the League of Nations indicated any desire to do more than protest Japan's gradual absorption of China.

It was somewhat ironic that with China in the throes of her death struggle with Japan, the United States and Britain in May followed the lead of Italy and Japan in raising their legations in China to the status of embassies. The conclusion by China of an important commercial treaty with French Indo-China, effective July 22, and an agreement with Britain for joint delimitation of the frontier between Burma and Yunnan Province were other developments of the year. On March 16 China filed a formal protest against the sale of the Chinese Eastern Railway by the Soviet Union to Manchoukuo (see MANCHOUKUO and JAPAN under *History*). The Nanking Government declared that it would refuse to acknowledge the validity of the sale.

Internal Political Trends. China's impotence in the face of Japanese aggression was due to the deep cleavages and sectional rivalries which divided the country. The power of the central government at Nanking was concentrated largely in Shanghai and the rich Yangtse Valley provinces, and was based almost exclusively upon the military power wielded by Gen. Chiang Kai-shek. The rich and populous southern provinces of Kwantung and Kwangsi were independent of the central government for all practical purposes. They were ruled from Canton by Marshal Chen Chia-

tang and his associates, organized as the Southwest Political Council. The Communist armies, driven westward from Kiangsi and Fukien Provinces in 1934 by Chiang Kai-shek, had established a new stronghold in Szechuan and were reported to be extending their influence into Shensi, Shansi, and Kansu in the west and northwest. The leading Chinese warlords of North China were cool towards Chiang, but supported him against Japan because the Nipponese threatened their extinction.

The Spread of Communism. The three major issues confronting the Nanking government during 1935 were those presented by Japan's aggression, the continued spread of communism, and the severe economic crisis precipitated largely by the American silver-buying policy. General Chiang, who had been engaged in sporadic warfare with the Communists ever since 1927, continued throughout 1935 his efforts to exterminate the movement, without apparent success. He no sooner cleared them from one region than they gained a foothold in another. Moreover Chiang found that areas occupied by his troops frequently reverted to communism as soon as his armed forces were withdrawn. Accordingly he took steps in Kweichow and certain other provinces to abolish or reduce the burdensome levies and land surtaxes which made the exploited peasantry receptive to Communist doctrines. Nevertheless communism continued to make substantial gains, not only among the peasantry but also in Chinese student and intellectual circles. The strength of the revolutionary movement closely linked with the Soviet Union was a powerful influence driving the Nanking régime towards an anti-Communist entente with Japan even at the cost of Chinese independence.

The Financial Crisis. Another powerful influence which promised to force the Nanking Government to accept Japanese financial aid and political domination was the silver policy of the United States. The Silver Purchase Act of June 20, 1934, caused a world-wide rise in the price of silver which effectively checked the economic recovery under way in China. Silver in China became more valuable than the paper currency issued against it, with the result that the Chinese took their paper currency to the banks, obtained silver for it, and exported the metal at a profit for sale to the United States. This produced a scarcity of money. Credit became dear, prices declined with widespread deflationary effect, and the resulting cycle of failing banks and business enterprises and trade stagnation caused general suffering and an alarming weakness of the Chinese banking structure. Attempts of the Nanking authorities to check the outflow of silver by the embargo decree of October, 1934, proved only partly successful. A 100,000,000 dollar (Chinese) domestic loan enabled the government to ride out the storm until Nov. 3, 1935, when the Central Government abandoned the silver standard, nationalized all silver stocks, and adopted a managed paper currency. The primary purpose of this move was to check the steady fall in prices. Much to the surprise of the Chinese, the United States soon afterwards permitted world silver prices to slump, thus dealing a severe blow to the Chinese currency policy. The effectiveness of the new policy was not fully determined by the end of the year.

The Anti-Japanese Agitation. In the areas under Chiang Kai-shek's control the growing resistance to his policy of seeming submission to Japan forced him throughout the year to resort to a

terroristic drive against anti-Japanese elements, especially among the university students. The provinces of South China, always militantly nationalistic, through the Southwest Political Council at Canton likewise bitterly attacked Chiang for his failure to protect Chinese independence and threatened to sever all relations with the Nanking régime should he yield further to Japan. These protests, given point by the attempted assassination of Premier Wang Ching-wei on November 1, came to a head during the sessions of the Fifth Kuomintang Congress at Nanking during November 12-24. At the same time Hu Shih and other leading educators of North China issued a statement calling on the Nanking government to preserve China's territorial and administrative integrity with "the resources of the entire nation. . . ."

The pressure for democratization of the Nanking régime and for resistance to Japan failed to influence Gen. Chiang Kai-shek. He insured his domination of the Nanking government by concentrating large bodies of his troops in the vicinity during the Kuomintang Congress sessions. Instead of bringing the Cantonese and other dissident elements into the government, Chiang on December 7 assumed the chairmanship of the Executive Yuan, the post corresponding to the Premiership which Wang Ching-wei had resigned. He thus extended his dictatorship by exerting direct control over the military and political activities of the central government. That he still favored a passive policy towards Japan was indicated by the cabinet reorganization of December 13, which brought into office a group of new ministers educated wholly or in part in Japan and apparently committed to a pro-Japanese policy. Among them were Gen. Chang Chun, Foreign Minister; Chiang Tso-pin, Minister of Interior; Wu Ting-chang, Industry; and Chang Kiangau, Railways.

These developments provoked a wave of student resistance which temporarily threatened the life of the Nanking government. Defying a Nanking decree of June 10, 1935, against anti-Japanese activities, the students of North China in October organized a federation which rapidly spread to other universities and secondary schools. Their nationwide protest movement was partly responsible for the miscarriage of the "autonomy movement" in North China in November. On December 9-11 they held great demonstrations in Peiping against the establishment of the Hopen-Chahar Political Council. The appointment of a pro-Japanese cabinet on December 13 and reports that it had secretly agreed to support a policy of "Sino-Japanese co-operation," led to new demonstrations in Shanghai. On December 25 Tang Yu-jen, newly appointed Vice Minister of Railways and chief go-between in the negotiations with Japan, was shot to death in Shanghai. By the end of December the student movement had assumed such strength that the authorities were obliged to declare martial law in Shanghai, Nanking, and Hankow. The anti-Japanese boycott had been resumed in Canton despite Japanese warnings of the grave consequences that would follow and it threatened to spread to the Yangtse valley. Unable to break up the student movement without alienating still further Chinese opinion, the Nanking Government faced the probability that its acquiescence in the student campaign would provide Japan with an excuse for new and more serious aggressions.

Floods. For the third successive year tremendous floods inundated the Yangtse Valley during the first half of July, covering some 50,000 square

miles of rich farm land, drowning thousands, and leaving some 10,000,000 persons homeless and exposed to famine. In December the Yellow River went on another of its periodical rampages, submerging 10 populous counties and driving 5,000,000 persons in Shantung Province from their homes. As the year closed millions were reported in danger of starvation and the most intense cold recorded in North China in many years was increasing the sufferings of the tortured nation.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. An organization founded in Portland, Me., in 1881 by the Rev. Francis E. Clark, D.D., a Congregational minister, for the purpose of pledging young people to certain forms of Christian devotion, expression, and service. In 1935 it consisted of 58,000 societies in the United States and Canada, with a membership of more than 2,500,000. Throughout the world there were in the same year approximately 80,000 societies, with a membership of more than 4,000,000, in 105 countries, dominions, and island groups, representing more than 80 evangelical and reformed denominations. These societies were united into national unions which, in turn, composed the World's Christian Endeavor Union. During 1935 the most notable advances reported were in Australasia, in Spain, in Korea, in the British Isles, and in Hungary. For the activities of this society consult THE NEW INTERNATIONAL YEAR BOOK for 1932.

At the biennial convention of the International Society of Christian Endeavor, held in Philadelphia, Pa., July 2-7, 1935, the Rev. Daniel A. Poling, D.D., I.L.D., was reelected president and the Rev. William Hiram Foulkes, D.D., the Rev. A. E. Cory, D.D., and Mr. Harry N. Holmes, vice-presidents. The official magazine is the *Christian Endeavor World* (quarterly). Headquarters are in the World's Christian Endeavor Building, Mt. Vernon and Joy Streets, Boston, Mass.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1836 and set forth in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs. Eddy in Boston, in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston but called more frequently by its adherents "The Mother Church."

The total number of recognized branches of The Mother Church reported for the fiscal year ending May 31, 1935 was 2721 of which 47 were college and university organizations. During the year 73 churches and societies were recognized as branches, 47 being in North America, 1 in South America, 17 in Europe, 4 in Australasia, 2 in Asia and 2 in Africa.

The affairs of The Mother Church are administered by a board of directors, which supervises the work of the board of education, board of lectureship, and committee on publication. The board of education instructs and authorizes students to teach Christian Science. The board of lectureship consists of 22 members who are engaged in delivering free lectures on Christian Science. During 1935 they delivered lectures in Europe, Australasia, Hawaii, and the Orient, Africa, Bermuda, West

Indies, Mexico, Canal Zone, United States, Canada, and Alaska.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the *Manual* of the church, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian (Danish, Swedish, and Norwegian) languages, each with the English translation opposite, and in braille.

The benevolent association of the church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home at Concord, N. H., is a home for Christian Scientists of advanced years. Dr. John M. Brewer was president of The Mother Church for the year ending May 31, 1935. Headquarters are at 107 Falmouth Street, Boston, Mass.

CHRISTMAS ISLAND. The name of two separate islands. (1) An island in the Indian Ocean (10° 30' S. and 105° 40' E.) belonging to the Straits Settlements. Area, 60 sq. miles; population (Jan. 1, 1934), 872. (2) An atoll in the Pacific (2° N. and 157° W.), over 100 miles in circumference, included in the (British) Gilbert and Ellice Islands Colony.

CHRONOLOGY. The following chronology lists the more important happenings of the year 1935 according to the dates of occurrence. In most cases these are treated in more detail under their respective headings. To such articles, particularly those on leading countries and States, such as UNITED STATES, GREAT BRITAIN, and NEW YORK, the reader is referred for additional information. For a list of prominent persons who died during the year, reference should be made to the article NECROLOGY and the important obituary notices there listed.

January 1—Ration card system abolished in Soviet Union.

?—74th Congress convened at Washington.

Ethiopia invoked Art. XI of League Covenant against Italy.

4—President Roosevelt asked Congress for huge public works fund to take 3,500,000 unemployed off relief.

President Roosevelt signed amended Agricultural Adjustment Act.

25—Texas entered the list of "wet" States with the repeal of the prohibition amendment to the State Constitution.

The U.S. Government protested the activities of the Moscow Congress of the Third International as a violation of Foreign Commissar Maxim Litvinov's pledge of Nov. 16, 1933, to President Roosevelt.

26—The first session of the 74th Congress was adjourned after a 5½-hour filibuster by Senator Huey Long.

28—Mussolini warned the League powers that the application of sanctions against Italy might precipitate war.

29—Queen Astrid of Belgium was killed in an automobile accident.

Conference of Scandinavian Foreign Ministers held at Oslo, Norway.

30—President Roosevelt signed the Guffey Coal Bill which passed Congress on August 23.

31—President Roosevelt signed a Congressional joint resolution calling for an embargo on arms shipments to all belligerents and withdrawing the government's protection from American citizens traveling on belligerent ships.

September 2—Japan protested to the Soviet Government against the activities of the Third International in Moscow.

2—A hurricane swept the Florida keys, killing 285 persons, including about 200 war veterans, and driving the liner *Dixie* on a reef. The liner's passengers and crew were removed in safety.

3—Secretary Hull announced that the Standard-Vacuum Oil Co. had agreed to cancel its newly acquired oil concession in Ethiopia.

The Italo-Ethiopian arbitration commission at Paris ruled that neither country was responsible for the clash at Ualual on Dec 5, 1934.

4—The League Council met at Geneva to consider the Italo-Ethiopian dispute.

A Mexican law was promulgated nationalizing all churches and buildings used for public worship.

6—President Roosevelt in a letter to Roy W. Howard promised a "breathing spell" to business.

7—The Italian Government closed most of its consulates in Ethiopia.

8—Senator Huey Long was mortally wounded at Baton Rouge, La., by Dr. Carl A. Weiss, who was then shot to death by Long's bodyguards. The Senator died September 10.

Majority of Polish voters boycotted parliamentary elections.

9—U.S. Navy Department authorized construction of 23 war vessels.

The Assembly of the League of Nations convened in Geneva in the midst of a European crisis precipitated by Italian war preparations against Ethiopia.

10—Mussolini called 50,000 more troops to the colors.

11—The British Foreign Secretary, Sir Samuel Hoare, speaking before the League Assembly, pledged Britain's "steady, collective resistance to all acts of unprovoked aggression."

12—Secretary of State Hull reminded Italy and Ethiopia of their obligation under the Kellogg-Briand Peace Pact to settle their differences peacefully.

13—Premier Laval assured the League Assembly that France would not evade her obligations under the League Covenant.

14—Mussolini's Cabinet announced that it would accept no compromise solution of its claims upon Ethiopia.

15—The German Reichstag at Nuremberg enacted laws restricting citizenship to those of German or related blood, forbidding marriages or sexual relations between Germans and Jews, and adopting the swastika banner as the national flag.

16—The Nazi party convention at Nuremberg was treated to a display of the progress made towards German rearmament.

17—Manuel Quezon was elected first President of the Philippine Commonwealth.

Pennsylvania voters rejected a proposal to revise the State Constitution along modern lines.

18—Italy announced short-term war loan totaling 7,000,000,000 lire.

19—Ethiopia accepted and Italy rejected a plan for solution of the Italo-Ethiopian dispute drafted by a conciliation committee of the League Assembly.

20—Nebraska's old-age pension legislation was declared unconstitutional by the State Supreme Court.

23—400,000 coal miners in 28 States struck for higher wages, which they obtained on September 26.

24—Joe Louis, Negro heavyweight boxer, knocked out Max Baer in the fourth round of a New York City bout.

The Seventh National Eucharistic Congress at Cleveland heard a denunciation of communism by Alfred E. Smith of New York.

25—Joaquin Chapaprieta formed a new Cabinet in Spain.

26—By unanimously agreeing to follow the procedure outlined in Article XV of the League Covenant in the Italo-Ethiopian dispute, the League Council insured the application of sanctions against Italy in case Ethiopia was attacked.

27—President Roosevelt declared U.S. would maintain 5-5-3 naval ratio by building equally with other nations.

28—Reich Government authorized its Minister of Church affairs to rule German Protestant Church despite protests of clergy and laymen.

29—Nazi candidates polled 90 per cent of the vote in the Meinel elections.

October 1—President Roosevelt spoke at Los Angeles, Calif., during vacation tour of the West. He asked liberals to stand together in support of progressive policies.

Lithuania abandoned the gold standard.

2—Ethiopia again requested the League Council to send neutral observers to watch developments on her frontiers.

The British Labor party voted 2,168,000 to 102,000 in favor of imposing League sanctions against an aggressor nation.

President Roosevelt witnessed the greatest fleet assembled in United States history in tactical maneuvers off San Diego.

3—Italy launched her attack upon Ethiopia from Eritrea; Italian planes bombed Adowa.

May—Gen. Malin D. Craig was appointed Chief of Staff of the U.S. Army.

4—Prime Minister Baldwin announced plans for large-scale rearmament of Britain.

While Italy's northern armies advanced toward Adowa, General Graziani's troops in Italian Somaliland attacked Ethiopia from the south.

5—A neutrality proclamation issued by President Roosevelt prohibited shipments of arms and munitions to Italy and Ethiopia.

Ethiopia invoked Article XVI of the League Covenant, providing for military, economic, and financial sanctions against an aggressor.

Ex-President Hoover attacked the Roosevelt Administration's "huge waste and folly" before the Western States Republican Convention.

6—Italy captured Adowa and Adigrat on the northern front and occupied the Gerlogubi wells on the south.

President Roosevelt warned U.S. citizens that if they traveled on Italian or Ethiopian ships it would be at their own risk.

7—The League Council, with Italy absent, unanimously agreed that Italy had resorted to war in violation of its obligations under the League Covenant.

The U.S. Supreme Court met for the first time in its new building.

8—The Ethiopian Government ordered the Italian Minister at Addis Ababa to leave the country.

9—The New Jersey Court of Errors and Appeals sustained the conviction of Bruno Richard Hauptmann.

10—The member States of the League Assembly voted 51 to 3 that Italy was guilty of aggression in violation of the League Covenant.

Field Marshal Kondylis carried out a monarchist coup in Greece, ousting Premier Tsaldaris, restoring the monarchical constitution, and assuming the powers of Premier and Regent.

11—The Italians captured the holy city of Aksum.

12—Freemasonry was abolished in Turkey.

U.S.-Japanese agreement divided Philippine textile market.

13—Gen. Emilio de Bono at Adowa proclaimed the annexation of the territory occupied by his troops.

Zyndram Kosciolkowski formed a coalition cabinet in Poland.

The Martinez Government in El Salvador executed 26 alleged conspirators.

14—The League members voted a credit blockade of Italy, with Austria and Hungary abstaining.

The Liberals under William Lyon MacKenzie King won a sweeping victory in the Canadian general elections.

16—The British Government rejected Premier Laval's plea that the British fleet be withdrawn from the Mediterranean to aid peace negotiations.

17—Friction within the Austrian Cabinet led to a reorganization in which Emil Fey, Minister of Interior, was eliminated.

18—Helena, Mont., was partly wrecked by a severe earthquake.

19—An Anglo-French understanding on European policy was reached.

The League members, with Austria, Hungary, and Albania abstaining, agreed to shut off imports from Italy, to embargo exports of key war materials to Italy, and to compensate those League States suffering abnormal economic losses from the imposition of sanctions.

General de Bono announced the abolition of slavery in conquered territory in Ethiopia.

20—Secretary of Agriculture Wallace ordered Federal regulation of live poultry industry in New York and New Jersey.

21—A hurricane and floods in Haiti were reported to have killed 2000 persons.

22—The House of Commons reconvened in London. Foreign Secretary Hoare said Britain had no intention of closing Suez Canal or applying military sanctions against Italy.

Danish parliamentary elections were won by Premier Stauning's Social Democratic-Radical government.

President Roosevelt arrived at Charleston, S.C., after a vacation cruise from California via the Panama Canal.

23—Martial law was declared in Kingstown, St. Vincent, B.W.I., after the Negro population engaged in severe rioting.

24—Mussolini withdrew a division of 15,000 men from Libya, lessening the threat of an attack upon Egypt.

Britain invited the U.S., Japan, France, and Italy to a naval conference at London beginning December 2.

25—President Roosevelt announced plans to convert the AAA from an emergency to a permanent basis.

The British Parliament was dissolved and new elections called for November 14.

26—Moral support of League policy in Italo-Ethiopian dispute pledged by United States.

A farmers' referendum showed a six to one vote for continuance of the AAA corn-hog control programme.

27—The first national convention of the Townsend Old-Age Pension Plan adherents closed in Chicago.

28—Hitler repudiated the neo-pagan movement in Germany.

Turkey reported to have offered military support to Britain against Italy in return for Turkish control of fortified Italian islands of the Dodecanese group.

Italian forces in southern Ethiopia completed a 50-mile advance.

The Chaco War was formally terminated by resolution of the Buenos Aires peace conference.

29—Vice President Garner and Speaker I.W. Byrns of the U.S. were received in audience by the Emperor of Japan.

Italy adopted defensive measures against sanctions.

30—Loans of 45 cents per bushel on 1935-36 corn supply authorized by AAA.

President Roosevelt and Secretary of State Hull warned American exporters of war materials not to exceed the normal peace-time shipments to Italy.

31—Anti-British demonstrations broke out in Rome.

November 1—An earthquake rocked a large area in northeastern United States and eastern Canada.

Premier Wang Ching-wei and several pro-Japanese associates were wounded by an assassin at Nanking, China.

The Reich's new universal conscription law went into effect with the drafting of the first class of recruits.

2—Senator Borah launched campaign to prevent return to power of the Republican Old Guard.

3—With republicans boycotting the polls, the Greek plebiscite showed an overwhelming majority for restoration of the monarchy.

4—U.S. silver-buying policy forced China to abandon silver standard and adopt managed currency.

Restrictions on corn-hog production removed by Secretary Wallace to relieve a shortage.

5—Republicans regained control of New York State Assembly and won contests in Philadelphia, Cleveland, and other cities, but were defeated in Kentucky State election.

President Cardenas of Mexico rejected a petition by the Roman Catholic hierarchy for modification of the religious laws.

7—Federal District Judge William C. Coleman of Baltimore held the Holding Company Act invalid.

Soviet Union and Turkey renewed their treaty of friendship.

8—The Italians occupied Makale in northern Ethiopia.

10—George II from London announced his acceptance of the invitation to become ruler of Greece.

11—The U.S. Army Air Corps—National Geographic Society balloon *Explorer II*, with Capt. Albert W. Stevens and Orvil A. Anderson as pilots, soared about 14 miles (72,395 ft.) into the stratosphere from near Rapid City, S.D.

Italy established a government import monopoly.

13—Egypt was swept by a wave of student riots against British control.

Miss Jean Batten, New Zealand aviatrix, completed a solo 1281-mile flight from Dakar, Senegal, to Natal, Brazil.

14—Despite Labor gains, the British general elections retained Prime Minister Stanley Baldwin's Conservative government in power for another five years.

15—President Roosevelt and Prime Minister MacKenzie

King of Canada signed an important reciprocal trade treaty. The Philippine Commonwealth was formally proclaimed at Manila and Manuel Quezon was inaugurated as President.

16—Gen. Emilio de Bono was recalled to Rome and replaced as commander of the Italian armies in northern Ethiopia by Marshal Pietro Badoglio.

17—Demands by the Knights of Columbus that the United States Government intervene to prevent "persecution of religion by the Mexican Government" were rejected by President Roosevelt in an open letter.

18—Economic sanctions voted by 52 League members against Italy went into effect.

19—Mussolini placed all gold transactions by Italians at home and abroad under State control.

20—Communists and Fascist "Gold Shirts" clashed in Mexico, D. F., before the National Palace; 5 were killed and 34 injured.

22—The first transpacific airline was inaugurated by Pan American Airways when the *China Clipper* left Alameda, Calif., for Honolulu. It arrived in Manila, P. I., November 29 after stops at Midway and Wake Islands and Guam.

23—Lincoln Ellsworth and his pilot left Dundee Island for a trans-Antarctic flight.

New Bulgarian cabinet was formed by George Kiosseivanov.

John L. Lewis, president of the United Mine Workers, resigned as Vice President of the American Federation of Labor in split over craft versus industrial unionism.

24—A radical revolution in northeastern Brazil led the government to declare martial law.

As Kuomintang Congress ended its sessions in Nanking, a Japanese-controlled autonomous region under Yin Ju-keng was establishing in 18 Chinese counties south of the Great Wall.

25—King George II landed at Athens and resumed the throne.

Italian invaders of southern Ethiopia reported to have met reverses.

Premier Taschereau's Liberal Government in Quebec retained power by an unexpectedly small majority.

U.S. Chamber of Commerce referendum showed members overwhelmingly opposed to New Deal.

Japan warned British not to interfere in China. The collection of processing taxes on Louisiana rice millers by Federal Government was enjoined by U.S. Supreme Court.

26—Pennsylvania Supreme Court invalidated the State's new graduated income tax.

Clement R. Atlee replaced George Lansbury as British Labor Party leader.

27—Cuban elections were postponed to 1936. Labor party won New Zealand election.

Construction of a \$29,000,000 dam near Guntersville, Ala., authorized by Tennessee Valley Authority.

A new revolutionary outbreak among Brazilian troops at Rio de Janeiro was crushed by the government after severe fighting.

29—U.S. legislation for control of arms and munitions manufacturers went into effect.

The Federal Emergency Relief Administration announced that it had made the final payments to States for direct relief.

30—George N. Peek, a leading spokesman for U.S. agriculture, resigned as president of Export-Import Bank in protest against Canadian-American reciprocal trade treaty.

Works Progress Administration announced that 3,500,000 persons had been transferred from dole to work relief.

Premier Kondylis resigned in Greece in protest against the King's decision to extend amnesty to republican prisoners and fugitives. Constantine Demerdjis formed new ministry.

December 1—With the major U.S. holding companies refusing their cooperation, the deadline was reached for compliance with the Utilities Holding Company Act.

3—Strict regulations to save coal, including shortening of school hours to three daily, went into effect in Italy.

4—Meeting in annual convention at New York City, the National Association of Manufacturers declared "war" on the New Deal.

5—Tentative plans for a transatlantic airmail service were approved at a conference of American, Canadian, British, and Irish Free State officials at Washington.

Secretary of State Hull warned Japan against infringing upon American treaty rights and interests in China.

6—Governor Talmadge of Georgia inaugurated drive to block renomination of President Roosevelt.

Italian planes bombed Dessye and Gondar; at Dessye, where 80 were reported killed and 200 injured, bombs wrecked Emperor Haile Selassie's palace and a hospital operated by the Seventh Day Adventists.

Former Gov. William Langer of North Dakota was acquitted of perjury charges by a Bismarck jury.

7—Poll of 10,000 U.S. manufacturers showed 82 per cent opposed to continuance of NRA.

Freeing Angelo Herndon, Negro Communists sentenced

to life imprisonment, Georgia Superior Court held State Anti-Sedition Law of 1866 unconstitutional.

9—The five-power naval conference opened at London, with the United States proposing a 20 per cent reduction in all fleets.

Walter Liggett, publisher of a Minneapolis, Minn., newspaper, was assassinated.

10—President Mendieta of Cuba resigned to pave the way for new elections.

The U.S. Treasury withdrew its support of the world silver market and prices collapsed.

Hoare-Laval peace proposals were approved by British Cabinet.

12—The 1923 Constitution was restored in Egypt to calm riots.

An autonomous régime was established in Hopei and Chahar, North China, under Japanese pressure.

The London Naval Conference rejected Japan's demand for equality with Britain and the United States.

Irish Free State Dail voted to abolish the Senate.

13—Publication of the Hoare-Laval peace proposals at Geneva aroused a storm of criticism.

Former President Calles returned to Mexico amid hostile demonstrations by labor organizations.

Japanese troops occupied Kalgan in Inner Mongolia.

14—Manuel Portela Valadares formed a new Spanish cabinet.

President Masaryk of Czechoslovakia resigned.

17—Gen. Juan Vicente Gomez, dictator of Venezuela, died.

The Greek parliament was dissolved and new elections called.

18—Sir Samuel Hoare resigned as British Foreign Secretary. Edouard Herriot withdrew as leader of French Radical Socialists.

Eduard Beneš was elected President of Czechoslovakia to succeed Masaryk.

U.S. national debt climbed to \$30,555,791,967.

19—Former Gov. William Langer of North Dakota and two associates were acquitted on charge of conspiring to obstruct Federal relief legislation.

British House of Commons upheld Prime Minister Baldwin in the face of criticism against his part in the Hoare-Laval peace plan.

22—Capt. Anthony Eden was appointed British Foreign Secretary.

British Government established a legislative council for Palestine over Jewish objections.

Reciprocal trade treaty between the United States and the Netherlands published.

23—An executive order of President Roosevelt called for dissolution of the NRA on January 1.

26—The Japanese Diet convened at Tokyo.

27—Viscount Saito was appointed chief adviser to Emperor Hirohito.

Uruguay severed diplomatic relations with Soviet Union, charging that Soviet Minister at Montevideo disseminated Communist propaganda.

28—Premier Laval's foreign policy was approved by French Chamber by narrow margin. Parliament approved a law for disarming the Croix de Guerre and other armed private organizations.

30—Great Britain intervened in Memel dispute in effort to lessen German-Lithuanian tension.

The Spanish cabinet was again reorganized.

31—Gen. Lopez Contreras elected President of Venezuela.

CINCINNATI, UNIVERSITY OF. An institution for the higher education of men and women in Cincinnati, Ohio, founded in 1870. The registration in the autumn of 1935 was 9373. The summer school enrollment for 1935 was 755. There were 626 members on the faculty. The endowment funds for the year ending June 30, 1935, amounted to \$9,109,735; the income for the same period was \$2,278,829. The library contained 370,123 volumes. President, Raymond Walters, A.M., Litt.D., LL.D.

CIRENAICA. See LIBYA.

CITROEN, sé'trô'ân', ANDRÉ GUSTAV. A French industrialist, died in Paris, July 3, 1935. Born in that city on Feb. 5, 1878, he was educated at the Lycée Condorcet and the École Polytechnique. About the year 1908, when he was head of a small gear-cutting shop, a group of financiers asked him to lend his engineering ability to the bettering of a small car called the Mors. So successful was he that production jumped from 200 to 1200 cars a month. At the outbreak of the World War, he served for a time with the engineers, and then persuaded the War Department to enter the field of munitions-making on a large scale. Backed

by a government subsidy, he sent engineers to the United States to purchase the necessary machinery, and soon the arsenal at Roanne was producing 55,000 "whiz-bang" shells every day, in addition to shells of larger calibre. He also provided the Government with a programme of fuel distribution and designed a rationing system of bread and sugar cards for the civil population.

At the close of the War, M. Citroen found himself in command of a large factory and many employees. He was undecided whether to manufacture sewing-machines or automobiles. He decided on the latter and plans for a low-priced car were advertised. Orders flowed in and even though the price of 7900 francs (then \$1000) was found to be too low and had to be raised, the demand was not lessened. The first car made was of 10 horsepower with two seats in front and one in the rear. By 1924 his factories turned out 400 a day, and in 1929, the peak year, 120,000 cars were produced. Two types of car were manufactured: a small 4-cylinder car and a 6-cylinder flivver, both light and cheap to operate.

Citroen was called the "French Henry Ford" because of the many ideas, particularly in connection with mass production and the advertising field, that he borrowed from that manufacturer. His most famous advertising exploit was accomplished in 1925, when he persuaded the officials of the Exposition of Decorative Arts, who were desirous of lighting the Eiffel Tower but had no money to do so, to allow him to place a huge electric sign reading "Citroen" on the Tower and so illuminate it. At the close of the Exposition the sign was allowed to remain on the payment of a yearly fee.

M. Citroen was essentially a gambler, and it was this gambling instinct that led to the downfall of the Citroen Motor Works. During the years of the depression when most firms were retrenching, the Citroen Works expended large amounts of money in new plants and machinery, and in view of the fact that sales were decreasing, it was not long before the firm began to feel financial difficulties. In addition, labor troubles added fuel to the fire. In 1934 the catastrophe occurred and on December 2, La Société André Citroen went into liquidation. The Government and the Michelin tire interests stepped in and on Jan. 5, 1935, the Company reopened its doors on a greatly reduced basis, and André Citroen was deposed as the ruler.

In 1932, Citroen and the National Geographic Society backed the George-Marie Haardt Expedition, which in February of that year completed an 8000-mile motor caravan journey from Beirut to Peiping. He also sponsored the Citroen Central African Expedition to open the first trade trail to the hidden jungle cities of Africa. His motor cars, equipped with caterpillar wheels, made their way over impassable country from Algeria to Cape Town, and although his dream of a regular route across the Continent of Africa never materialized, it did show the hardihood of the Citroen motor car.

CITY, REGIONAL, STATE, AND NATIONAL PLANNING. Merger of the National Conference on City Planning and the American Civic Association as the American Planning and Civic Association has been effected. *The American Planning and Civic Annual* takes the place of the yearly volumes published by the two bodies. *Planning and Civic Comment* supersedes *The City Planning Quarterly*, *Civic Comment* and *State Recreation*. At the National Planning Conference in May resolutions favoring a permanent national

planning board and a new federal bureau to gather and publish information on urban conditions and problems were adopted. The fact was stressed that the growth of suburban areas is outrunning that of cities, with a consequent need for planning readjustment.

Billboard Decision. Massachusetts legislation vesting the regulation of billboards in the State Department of Works was upheld by the Massachusetts State Supreme Court on Jan. 10, 1935 (Gen. Outdoor Advg. Co., Inc., and others, vs. Dept. of Works, 193 N. E., 789; for digests see *Planning and Civic Comment*, Jan.-Mar.; *The American City*, Feb.; and for a longer digest, *Public Roads* for March).

City, County, and Regional Commissions. The National Resources Committee, successor to the National Planning Committee, reported for the New INTERNATIONAL YEAR BOOK on November, 18, that no information on planning commissions later than the Eleventh Circular Letter (May 15, 1934) had been published but that unofficial information indicated that since receipt of the data supplied for the letter about 100 city and 350 county and regional planning commissions had been created. This brings the total number of commissions of the three classes from 824 (1934 INTERNATIONAL YEAR BOOK) to 1274, or to 1200, allowing for discontinuances. A new survey at an early date was proposed. Nearly all of the 48 American States have taken some action on State planning, either by statute or by boards appointed by governors.

The Tennessee legislature of 1935 passed six planning and zoning acts. One of them created a commission with power to make a State plan and to form planning regions and commissions. Another act enables any city in the State to create planning commissions, instead of compelling each city to obtain an enabling act. Other acts authorize city, county, and regional zoning.

International Congress. The world-wide interest in planning is shown by the fact that the 14th International Congress of the Federation for Housing and Town Planning, held at London in July, was attended by 931 delegates from 47 countries.

State Parks. "Since Emergency Conservation Work began, more than 115 new State parks were established and additions were made to 43 established parks." The new areas total about a half million acres. (For details, see *Planning and Civic Comment*, Jan.-Mar. 1935.)

England and Wales. The status of town planning in England and Wales, as of Mar. 1, 1935, was detailed in *Town and County Planning* (London) for June, 1935. Supplementary data appear monthly.

Bibliography. Adams, *Outline of Town and City Planning* (New York); Bassett and others, *Model Laws for Planning Cities* (Cambridge, Mass.); Schwan, *Town Planning and Housing Throughout the World* (text French, German, and English; London).

CIVIL ENGINEERS, AMERICAN SOCIETY OF. An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse among men of practical science.

The membership as of Dec. 26, 1935, consisted of 18 honorary members (persons of acknowledged eminence in engineering), 5698 members (civil, military, naval, mining, mechanical, electrical, and other engineers in active practice 12 years

and qualified to design as well as to direct engineering work), 6087 associate members (those who have been practicing eight years), 3034 juniors (beginners in the profession), 99 affiliates (persons qualified to cooperate with engineers but not themselves engineers), and four fellows (contributors to the permanent funds of the society who may not be eligible to membership). There were 57 local sections and 113 affiliated student chapters in colleges and universities throughout the United States.

The sixty-fifth annual convention was held in Los Angeles, Calif., July 3-7, 1935. The general topic of discussion was the contribution of engineering to the development of California. The fall meeting took place in Birmingham, Ala., Oct. 16-19, 1935, and considered the past and future development of the Southeastern States. At both these meetings the various technical divisions also presented papers dealing with their special fields of work.

The society publishes two monthly magazines: *Civil Engineering*, which presents news of society affairs and articles of more popular appeal; and *Proceedings*, which contains technical papers that are later collated, with discussions, in the yearly volume of *Transactions*. At the annual meeting held in New York City, Jan. 16-19, 1935, there were awarded medals and prizes for papers published in the *Transactions* for 1934. These included the Norman Medal to Leon S. Moisseiff, the J. James R. Croes Medal to H. M. Westergaard, the Thomas Fitch Rowland Prize to Miles A. Killmer, the James Laurie Prize to E. Warren Bowden and H. R. Seely, the Arthur M. Wellington Prize to J. C. Evans, and the Collingwood Prize for Juniors to G. H. Hickox and G. O. Wessenauer.

The officers of the society in 1935 were: Pres., Arthur S. Tuttle; vice-presidents, Henry D. DeWitt, John P. Hogan, Henry E. Riggs, and D. H. Sawyer; secretary, George T. Seabury; treasurer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

CIVILIAN CONSERVATION CORPS. See CHILD WELFARE; FORESTRY; UNIVERSITIES AND COLLEGES.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office, this organization has sought to accomplish its end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government officials. It also has advocated, on the principle that public office is a public trust, that those best fitted through demonstrated ability and capacity should serve the State.

During 1935 the league urged the competitive classification, under the civil service law, of positions in the new government agencies to carry out the administration's recovery programme. It protested against legislation and executive orders returning to the exempt or politically-appointed class groups of positions, which had in previous years been removed therefrom. It also protested against demands upon Federal employees for campaign contributions and political services. It urged that an end be made of appointment of presidential postmasters on a political basis and vigorously opposed the use of Federal offices to reward unqualified party workers.

Good Government is the league's official organ.

The officers in 1935 were: George McAneny, president; W. W. Montgomery, Jr., chairman of the executive committee; Howard R. Guild, chairman of the council; Ogden H. Hammond, treasurer; and H. Eliot Kaplan, secretary. Headquarters are at 521 Fifth Avenue, New York City.

CIVITAN INTERNATIONAL. An organization composed of selected professional and business men throughout the United States and Canada, who have dedicated themselves to unselfish service to their city, county, State, and Nation. The first Civitan Club was founded in Birmingham, Ala., in 1917, the name being formed from the Latin "civitas." A total of 300 clubs had been chartered by Nov. 1, 1935.

The 1935 Convention was held in Miami, Fla., June, 16-19. The official organ is *The Civitan* (monthly). The officers for 1935 were: President, Judge Arthur Crownover, Nashville, Tenn.; vice-presidents, C. Francis Cowdrey, Jr., Fitchburg, Mass.; Fred W. Halls, Toronto, Canada; Dr. Wingate M. Johnson, Winston-Salem, N. C.; Frank E. Lautz, Miami, Fla.; and Wm. M. West, Denver, Colo.; international secretary, Arthur Cundy, Birmingham, Ala.; and international treasurer, Herbert Porter, Atlanta, Ga. Headquarters are 803-4 Farley Bldg., Birmingham, Ala.

CLARK UNIVERSITY. A nonsectarian university in Worcester, Mass., founded in 1889. The registration for the autumn of 1934 was 375. The enrollment for the summer session was 150. There were 39 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 149,000 volumes. President, Wallace W. Atwood, Ph.D.

CLEVELAND. See MUSIC.

COAL. According to preliminary statistics of coal production in 1935, based on railroad carloadings and river shipments, the U.S. Bureau of Mines estimates the output in the United States at a total of 420,327,000 tons, an increase of less than 1 per cent over the total output in 1934, as shown in the table on page 155. Of the total production, bituminous coal with 369,324,000 tons showed an increase of almost ten million tons over the previous year; anthracite, with 51,003,000 tons, a decline of more than six million tons. The gain in bituminous production was distributed generally, with few exceptions, among the several States, as shown in the table.

By comparison with earlier years the total output, though almost 71 million tons greater than in the low year of 1932, is less by 21 million tons than in 1931, by 116 million tons than in 1930, and by almost 238 million tons than in 1923.

Throughout the first nine months of the year, the bituminous coal industry was threatened with a destructive strike. In February, representatives of the United States Mine Workers proposed a new contract to succeed the one that was to end on March 31 with provision for a 30-hour week and for specified wage increases. Failure to reach agreements with the operators brought repetitions of strike orders through the year to the 400,000 miners, each successive order being rescinded at the eleventh hour by the request of President Roosevelt. The Guffey-Snyder Coal Act (see UNITED STATES under *Administration*), which aimed to stabilize the industry through Federal Commissions, though finally passed by the Congress in August and signed by the President, was immediately protested by the operators as an invasion of Constitutional rights, and at the close of the year had not yet been passed upon by the U.S.

Supreme Court. Hence, on September 23, the long deferred strike became effective. It lasted six days. On September 26, a compromise contract was signed by operators and miners to remain effective until Apr. 1, 1937. The new contract retains the former 35-hour week, but grants a basic day-worker rate of \$5.50 in the Appalachian area, a 9-cent per ton increase for tonnage men as against the 15-cent increase demanded, a 10 per cent increase for "dead work" as against the demand for double that increase, and an increase of 9 cents a ton for pick mining.

COINS, VALUE OF FOREIGN. The legal estimates of the value of foreign coins on Jan. 1, 1936, as issued by the U. S. Secretary of the Treasury, are given on the table on page 156.

COKE. According to the preliminary report of the U. S. Bureau of Mines the total production of coke in 1935 was 35,209,240 net tons, a rise of 10.6 per cent over the production in 1934, of 31,821,576 net tons. Of the year's output, 936,200 net tons were beehive coke (1,028,765 net tons in 1934) and 34,273,040 net tons were by-product coke (30,792,811 net tons in 1934).

COLGATE UNIVERSITY. A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1935 there were 1042 students enrolled. The faculty numbered 107 members. The productive funds amounted to approximately \$6,500,000, and the income for the year was \$638,000. The library con-

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLOMBIA. A South American republic, third in population and fifth in area among the republics of that continent. Capital, Bogotá.

Area and Population. With an area of 447,536 square miles, Colombia had an estimated population on Jan. 1, 1935, of 9,225,000 (7,851,000 at 1928 census). According to the 1928 census, 35 per cent of the population is white, 5 per cent Negro, 2 per cent Indian, and 58 per cent of mixed blood. The

urban population is 31 per cent of the total. The principal cities, with their estimated 1933 populations, are: Bogotá, 264,607; Medellín, 145,880; Barranquilla, 129,715; Cartagena, 122,944; Cali, 104,232; Manizales, 100,645; Ibagué, 71,370; Cúcuta, 64,372. Roman Catholicism is the state religion. Incomplete vital statistics for 1933 showed living births numbering 223,878; deaths, 122,400; marriages, 32,491.

Education. Illiteracy declined from 68 per cent of the total population over 10 years of age in 1918 to 51.57 per cent in 1928. Primary education is free but not compulsory. In 1933, out of 1,538,948 chil-

dren of school age, 513,775 were in 7222 public schools and 230,847 in various private schools. In 1931 there were 25 industrial schools, 17 normal schools, and 6 art schools. There are two national universities—at Bogotá and the School of Mines at Medellín—and departmental universities at Medellín, Cartagena, Popayan, and Pasto. By the law of Dec. 17, 1934, at least 10 per cent of all receipts of the central government must be devoted to education.

Production. Agriculture and mining, the principal occupations, provided about 75 and 22 per cent, respectively, of the value of all exports in 1933. Coffee and bananas are the chief export crops. For the year ended June 30, 1935, coffee exports totaled 3,126,092 bags of 60 kilos (132 lb.), compared with 3,464,328 bags exported in 1933-34. The total coffee crop in 1934-35 amounted to 3,300,000 bags. Banana exports in the calendar year 1934 totaled 7,668,000 stems, valued at 6,122,000 pesos, against 6,946,000 stems, valued at 4,908,000 pesos, in 1933. Output of other crops (1934) was: Sugar, 660,000 bags (of 110 lb.); cotton, 3,527,000 lb. of clean fibre; wheat, 2,572,000 bu.; corn, 19,684,000 bu.; potatoes, 7,349,000 bu.; cacao, 22,046,000 lb.; rice, 132,276,000 lb.; tobacco, 17,637,000 lb.; pita fibre, 22,046,000 lb. Stock raising is important; in 1932 there were 7,592,020 cattle, 1,544,617 swine, 830,807 sheep, 925,733 horses, 453,232 mules, and 288,445 asses. The forests, covering some 150,000,000 acres, yield rubber and cedar, dye, and cabinet woods.

The chief minerals and the 1934 output (1933 figures in parentheses) were. Petroleum, 17,299,000 bbl. (13,154,000); gold, 344,140 troy oz. (298,242); silver, 125,884 troy oz. (107,743); platinum, 45,971 troy oz. in 1933; coal, 200,000 metric tons in 1933. Platinum exports in 1934 were 1703 kilograms. Colombia's emerald mines are famous. The adoption of a protective tariff in 1931 was followed by a rapid expansion of domestic industries. Manufactured production in 1934 was reported as 50 to 80 per cent greater than in 1933, and some 300,000 persons were employed in factories at the end of the year. The value of industrial production in 1934 was 88,791,626 pesos.

Foreign Trade. Imports in 1934 totaled 87,559,297 pesos (49,666,529 in 1933) and exports, excluding gold bullion and specie, totaled 123,891,170 pesos (67,586,315 in 1933). The depreciation of Colombia currency and important changes in prices for export products accounted in part for the increases of 76 and 89 per cent in the value of imports and exports, respectively, in 1934. The United States supplied 43.9 per cent of the 1934 imports (36.8 per cent in 1933) and purchased 64.1 per cent of the exports (67.6 in 1933). Great Britain and Germany were the other principal sources of imports and France, Canada, Netherlands India, and Germany were the other main export markets. The value of the leading export products in 1934 (in 1000 pesos) was: Coffee, 82,460; petroleum, 28,162; gold, 13,829; bananas, 6122; cattle hides, 2870; and platinum, 2812.

Imports in 1935 totaled 106,854,000 pesos and exports were 123,602,000 pesos (preliminary), excluding gold shipments. United States figures showed imports from Colombia in 1935 of \$50,443,195 (\$47,115,152 in 1934) and exports to Colombia of \$21,636,065 (\$21,942,772 in 1934).

Finance. Ordinary revenues of the Central Government in 1934 totaled 45,563,000 pesos and ordinary expenditures were 42,753,000 pesos, leaving a surplus of 2,810,000 pesos. Extraordinary expenditures totaled 24,376,000 pesos and extraordi-

nary revenues were 23,923,000 pesos, raised, mainly for national defense purposes, through credit operations and bond issues. Exclusive of unpaid service charges on the foreign debt, there was a fiscal deficit of 18,902,557 pesos at the end of 1934. Including this deficit, the public debt on Dec. 31, 1934, totaled 170,166,096 pesos (foreign long-term debt, 66,106,898; internal debt, 54,206,851; banking debt and miscellaneous, 30,949,769). The total debt on Dec. 31, 1933, was 151,376,864 pesos.

The 1935 budget estimates placed ordinary revenues at 44,140,000 pesos and ordinary expenditures at 42,844,365 pesos. In addition appropriations aggregating 11,451,191 pesos were carried in various special budgets. The average exchange value of the Colombian peso (par \$0.9733) was \$0.9530 in 1932, \$0.8032 in 1933, and \$0.6152 in 1934.

Communications. The Magdalena River, navigable to 500-ton vessels for 514 miles from Barranquilla, is Colombia's main traffic artery. Railway lines in 1933 extended 1980 miles, divided among 11 national and 3 British companies, and some 1400 miles were under construction. The President reported in June, 1935, that the road construction programme launched in 1931 was 60 per cent completed, with 2635 miles finished. Ten air lines, covering some 2400 miles of routes, were in operation.

Government. Executive power is vested in a President elected for four years by direct popular vote; he is ineligible for reelection for four years after completion of his term. A Congress of two houses exercises the legislative power. The 56 members of the Senate are elected for four years by Departmental Assemblies and the 118 Deputies forming the House of Representatives are elected for two years by direct suffrage. President in 1935, Dr. Alfonso López (Liberal), who assumed office Aug. 7, 1934.

HISTORY

Leticia Protocol Ratified. Ratification of the Leticia Protocol by the Colombian Congress on Sept. 17, 1935, finally liquidated the menacing controversy with Peru over the Leticia corridor which brought the two countries to the verge of war during 1932-33. Congressional approval of the treaty, signed by the plenipotentiaries of Colombia and Peru at Rio de Janeiro on May 24, 1934, was secured only after a hard-fought political struggle between the Liberal Government and the opponents of the treaty, headed by the Conservatives. The Peruvian Congress ratified the protocol on Nov. 2, 1934, but the Colombian Senate, in which the Conservative Opposition held a majority, refused its consent, despite the urgings of President López and the appeals of the United States and Brazilian Governments. Unable to win over the Opposition, President López in January dissolved the special session of Congress called to ratify the treaty and appealed to the country for the election of a new Congress. Shortly afterwards he secured Peru's consent to the extension until Nov. 30, 1935, of the time limit for ratification of the protocol, which had expired on Dec. 31, 1934. He also reorganized the cabinet, appointing former President Olaya Herrera, under whom the Leticia Protocol had been negotiated, to the key post of Foreign Minister.

While ratification of the treaty with Peru was the main issue in the ensuing political campaign, the Liberals also faced vigorous opposition to their programme of political and social reform. President López, an able banker and financier, declared

that under the existing tax system the wealthy did not pay their share of the cost of government. He promised the lower classes that under Liberal rule the rich would "learn what taxes are and what they mean." This threat, combined with the liberal record of the government with regard to labor and social legislation, led the privileged classes to organize an association, known as the *Accion Patriótica Económica Nacional*, to protect the rights of capital and property. The Conservatives boycotted the elections on the ground that the Liberals would prevent the free expression of the voters' choice. They threw much support, however, to the *Accion Patriótica Económica Nacional*, which actively entered the Congressional contest.

The elections to the Chamber of Deputies on May 26 gave the Liberals 105 out of 118 seats. Independent Liberals won 10 seats, the Communists 2, and the Socialists 1. Elections to the Senate, held in the State Assemblies in June, gave the Liberals control of that body also. With its approval insured, the Leticia Protocol was reintroduced in Congress and ratified after a long and heated debate during which Foreign Minister Olaya Herrera challenged former Supreme Court Justice José Miguel Arango to a duel for his criticism of the pact. While the Leticia Protocol was awaiting ratification a mixed Colombian-Peruvian commission, provided for in the treaty, studied the problem of demilitarizing the Amazon frontier and of carrying out the other provisions of the agreement.

Other Issues. The session of Congress which opened July 20, 1935, at the insistence of President López undertook to revise the Constitution so as to permit needed reforms affecting private property rights and judicial procedure. On Apr. 12, 1935, the Supreme Court had declared unconstitutional two laws raising income and capital taxes, passed by the López Government in December, 1934. The curbing of the Supreme Court's powers was therefore considered essential to the success of the Liberal reform movement. In his message to Congress President López also called for the wider distribution of agricultural land, which was largely in the hands of a comparatively small but wealthy group; improvement of agricultural methods, reform of the educational system so as to provide more technicians and fewer lawyers and physicians; development of credit facilities for the expansion of agriculture, industry, and mining with local capital; further depreciation of the peso to redress the unfavorable balance of payments; modification of the oil law; and additional legislation regulating strikes, labor contracts, and unions. Congress was still considering most of these measures at the end of 1935. Before recessing on December 23, Congress passed an act raising income-tax rates and creating an excess-profits levy and a patrimonial impost. It also approved the budget for 1936, with ordinary revenues and expenditures calculated at 68,684,000 pesos.

The introduction of such legislation aroused strong protests from the coffee planters and other interests and served to further a business recession which became apparent in the first quarter of the year. The decline of coffee prices, however, was undoubtedly the chief stimulus to this recession. Despite the government's measures, the deep-seated discontent among the laboring classes continued to manifest itself in frequent strikes and occasional minor disorders. Like most of the Latin American countries, Colombia sought to solve some of its pressing economic and financial prob-

lems by securing new foreign markets for its products. A reciprocal trade agreement was signed with the United States on Sept. 13, 1935, in which the American Government agreed to continue the tariff and other exemptions which most Colombian products enjoyed in the United States. In return, Colombia agreed to reduce its customs duties on an important percentage of products imported from the United States, and not to increase its tariff duties or other prohibitions or financial imposts upon other American products. Negotiations for a similar treaty were under way with Japan, whose exports to Colombia in 1934 showed a four-fold increase over the previous year.

The newly established National Economic Council began to function in May, 1935, providing an agency through which business interests and government officials might cooperate in the development of the national economy. By the law of July 30, 1935, the government was authorized to withdraw silver coins from circulation, prohibit the exportation of silver, and use the profits accruing from the exchange of notes of the Bank of the Republic for the retired coins. The exchange control system, in effect since September, 1931, was made somewhat more rigorous early in 1935. The exchange Control Board reported that during 1934 it received 76,467,000 dollars in exchange and allocated 77,911,000 dollars. American frozen credits in Colombia on Jan. 1, 1935, were estimated at \$5,000,000.

COLORADO. Population. On Apr. 1, 1930 (Fifteenth Census), 1,035,791; July 1, 1934, by latest Federal estimate, 1,056,000; 1920 (Census), 939,629. Denver, the capital, had (1930) 287,861 inhabitants; Pueblo, 50,096.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame) ..	1935	1,099,000	1,801,000 ^a	\$11,706,000
	1934	960,000	1,164,000 ^a	13,968,000
Sugar beets ..	1935	142,000	1,817,000 ^a	
	1934	169,000	1,566,000 ^a	7,893,000
Corn	1935	1,558,000	12,464,000	8,725,000
	1934	842,000	3,368,000	3,267,000

^a Tons. ^b 100-lb. bags.

Mineral Production. For 1935, the production of gold (351,347 fine oz.) was valued at \$12,797,145 (at \$35 an oz.); silver (4,605,845 fine oz.), \$3,399,144; copper (14,339,000 lb.), \$1,204,476. The production of lead and zinc exceeded that of 1934. The five metals were produced from 900 lode mines, and from some 850 placer operations. Of the State's 1935 production, the Cripple Creek district produced 128,102 fine oz. of gold; Park County, 73,234 fine oz. of gold; Eagle County more than half the silver and nearly nine-tenths of the copper.

The production of coal for 1935 amounted to 5,872,000 net tons (preliminary) as against 5,210,933 for 1934. Petroleum produced in 1934 totaled 1,162,000 bbl.—some 26 per cent more than in 1933. Petroleum was found in the Hiawatha natural-gas field. The wells of many fields producing natural gas remained closed in 1934, for lack of immediate

means to deliver fuel in competition with coal.

The greatest single mining operation in the State in 1934 was reported to be that of the Climax Molybdenum Company, at Climax, in Lake County. This operation mined during the year 1,275,856 tons of ore, from which were extracted concentrates carrying 8,378,683 lb. of molybdenum and valued at some \$5,800,000. This output comprised some nine-tenths of that of the year for all the Union, which in turn had grown to nearly twenty-five-fold the initial production of 1918.

Education. The State's educational organization prepared a revision of the elementary studies, for issue in 1936. A movement was under way to enact a graduated income tax as a source of State aid to public schools, according to the *Journal* of the National Education Association.

Legislation. A tax of 2 per cent on sales at retail was enacted on February 2, to go into effect on March 1. The act exempted goods such as gasoline and potable liquors, on which the State already levied an excise tax; and tobacco, which paid a Federal tax in excess of 12½ per cent of value. It covered sales of gas and electricity and applied to telephone and telegraphic services, but not to such services as those of physicians and of barbers. It was to be collected by seller from purchaser, in amounts as small as the mill, this necessitated a system of tokens for the collection of small amounts. A separate act directed the segregation of \$1,200,000 a year of the proceeds of this tax to meet the cost of a system of pensions for old people. The chief part of the proceeds was designed to cover the contribution to the relief of the indigent unemployed, required of the State by the FERA as a condition to the receipt of further Federal aid for that group.

Political and Other Events. Governor Johnson called the Legislature in special session in October to consider alleged misconduct in the administration of the law regulating the liquor traffic on the part of the Secretary of State James A. Carr. Carr was found guilty. Near Leadville, a tunnel 20,223 feet long, begun in 1933, to carry water from the upper Roaring Fork River to another watershed, for irrigating farms served by the Twin Lakes Company in Crowley County, 225 miles away, and financed by the RFC, was cut through early in February. Denver made preparations to vote on the local adoption of the Townsend plan of high pensions for the aged, to be provided by a local sales tax; but Mayor Begole canceled the proposed referendum at the request of Dr. Townsend, who declared his plan suited only to nation-wide adoption. See DUST STORMS; FLOODS.

Officers. The chief officers of the State, serving in 1935, were: Governor, Ed C. Johnson; Lieutenant-Governor, Ray H. Talbot; Secretary of State, James A. Carr (removed) and George E. Saunders; Treasurer, Charles M. Armstrong; Attorney-General, Paul P. Prosser; Superintendent of Public Instruction, Inez J. Lewis.

Judiciary. Supreme Court: Judges, Francis E. Bouck, Benjamin C. Hilliard, Haslett P. Burke, E. V. Holland, Charles C. Butler, John Campbell, John C. Young.

COLORADO, UNIVERSITY OF. A coeducational, State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1935 was 3352; the summer session enrollment was 3245. There were 325 faculty members, exclusive of assistants. The total income for general maintenance from State

tax, fees, tuition, etc., was \$1,374,756.60. The University received \$315,260 for the maintenance of Colorado General Hospital and \$141,653 for the maintenance of the Colorado Psychopathic Hospital. The library contained 271,681 volumes, 12,000 pamphlets, and 3500 maps. President, George Norlin, Ph.D., LL.D., Litt.D., L.H.D.

COLORADO RIVER. See WATERWORKS; AQUEDUCTS.

COLUMBIA UNIVERSITY. A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway and 116th Street, are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including New College and the Advanced School of Education; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and the nonprofessional graduate faculties of political science, philosophy, and pure science. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are at the Medical Center on West 168th Street, the College of Pharmacy on West 68th Street, Seth Low Junior College in Brooklyn, N. Y., Bard College at Annandale-on-Hudson, N. Y., and the New York Post-Graduate Medical School on East 20th Street. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, as well as at several external centres.

On the basis of the enrollment on Nov. 1, 1935, the total number of resident students for the year was estimated at 30,984, distributed as follows: Undergraduates, 3296, of whom 1762 were in Columbia College, 1023 in Barnard College, 206 in Seth Low Junior College, 133 in Bard College, and 172 in other schools; and graduate students, 2705. The distribution of professional students was as follows: Law, 599; medicine, 422; engineering, 254; architecture, 64; journalism, 71; business, 449; dental and oral surgery, 242; pharmacy, 403; optometry, 94; library service, 400; and Teachers College, 7383; 5093 students were enrolled in university extension classes and 286 were unclassified. Of the 2908 nonresident students, 700 were registered in home study courses and 2208 in special and extramural courses. There were 11,713 students registered for the summer session of 1935. The grand total of resident students is exclusive of 2490 duplicate registrations.

The faculty and officers of administration in 1935-36 numbered 3197, of whom all but 62 were in active service. This number was distributed as follows: Professors, 385; associate professors, 205; assistant professors, 318; associates, 250; instructors, 501; lecturers, 103; assistants, 306; curators, 6; associates, instructors, lecturers, and assistants in Teachers College, 148; instructors and lecturers in the College of Pharmacy, 15; instructors, lecturers, and assistants in Bard College, 20; instructors in extension and home study, not included above, 424; instructors in summer session, not included above, 369; officers of administration, 85; emeritus and retired officers, 62.

The University received from Mrs. T. Coleman du Pont the estate known as "Nevis" at Irvington-on-Hudson, formerly the property of a son of Alexander Hamilton, to enable the University to make new provision for its work in the field of landscape architecture, botany, and gardening. The

School of Journalism was established upon a graduate basis. A celebration was held in honor of the 1000th anniversary of the birth of Firdausi, Persian Epic Poet, on November 8; of the 300th anniversary of the death of Lope De Vega Carpio on April 27; and of the 800th anniversary of Maimonides on March 30. The Columbia University Press brought out the one volume *Columbia Encyclopedia*. Professor Colin G. Fink announced the solution of the problem of coating steel with aluminum. Professor Edwin A. Armstrong announced developments in multiplex signaling and static-less radio. The University's work in the field of Far-Eastern studies was amplified and the Chinese and Japanese Libraries were opened in new quarters on April 12.

During 1934-35 the University received gifts in money representing a total of \$1,766,571. The principal gifts, in addition to \$762,727 from Edward S. Harkness toward the construction and equipment of South Hall, were: \$211,262 from the Estate of John S. Kennedy for the Kennedy Endowment Fund; \$150,000 from the Estate of Joseph R. DeLamar for the DeLamar Fund; \$50,000 from the Estate of Charles T. Mathews, to establish the Mathews Lectureship in the School of Architecture; \$12,220 from the Estate of Nathaniel L. Britton, for the Britton Fund; \$10,000 from Mrs. Charles Pierre, to establish the Pierre Educational Fund; \$165,747 from the Rockefeller Foundation, for various forms of research work; from the Carnegie Corporation, toward the support of the School of Library Service, \$25,000; for the development of the Department of Music, \$5000; for research in various fields, \$37,000; \$32,060 from the Josiah Macy, Jr., Foundation for use in various forms of research work; \$30,000 from Mrs. T. Coleman du Pont to cover the cost, for a period of two years, of the maintenance and upkeep of "Nevis" at Irvington-on-Hudson; from the General Education Board, for the Department of Practice of Medicine, \$15,000; for the sub-department of Tropical Medicine, \$8000; \$26,837 from the Commonwealth Fund for various forms of research work; \$13,500 from the Estate of Seth Low for general purposes; \$10,000 from an anonymous donor for the Institute of Cancer Research; \$10,000 from the W. K. Kellogg Foundation, for special research in the Department of Practice of Medicine. Gifts to income totaled \$553,491.

The capital endowment of the university in 1935, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, Bard College, and New York Post-Graduate Medical School) was \$84,383,264. The estimated total resources as of June 30, 1935, were \$151,990,386. The annual budget for 1935-36 was \$14,853,385. The library contained 1,476,450 volumes. President, Nicholas Murray Butler, Ph.D., Hon.D., LL.D., Litt.D.

COMMONWEALTH FUND. See INTERNATIONALISM.

COMMUNISM. The Third International. The Seventh Congress of the Third (Communist) International met in Moscow from July 25 to August 20, with 400 delegates from 50 countries in attendance. Because the activities of the Comintern, as the Third International is called, had embarrassed the Soviet Government in the conduct of its foreign relations, no Congress had been held since 1928 (see 1934 YEAR BOOK, p. 158). Repercussions of the 1935 Congress again demonstrated the inconsistency between the Soviet Union's attempts to maintain stable and peaceful relations

with the capitalist countries and its sponsorship of an international organization dedicated to the overthrow of all capitalist countries by revolution. The net effect of the Comintern's meeting was to revive the anti-Communist agitation in non-Communist countries, to imperil the Soviet Government's newly established relations with the United States and other governments, and to obstruct the development of a system of collective security in Europe which the authorities at Moscow were vitally interested in perfecting before the expected outbreak of war with Germany and Japan.

Ruled by the conviction that communism was destined eventually to clash in a world-wide struggle with fascism, the Congress of the Comintern made two important decisions representing sharp departures from its previous strategy. It decided (1) to relax the iron and inflexible control it had hitherto exercised over orthodox Communist parties in the various countries, and (2) to promote the formation of a united front against fascism by all anti-Fascist groups, including the petty bourgeoisie, liberals, Socialists, laborites, and Catholics whom the Communists had previously regarded as sworn enemies. The freeing of local Communist organizations from the rigid bonds of procedure, ideology, and strategy prescribed by the parent organization at Moscow was due to the realization that the effort to employ in other countries the methods which triumphed in Russia had proved a failure. Instead of continuing the attack upon "bourgeois democracy," Communists were ordered to fight "with complete unselfishness" to save it from fascism. This about face was motivated by no tenderness for representative government as such. It was inspired by fear that the triumph of fascism over democratic institutions in other countries would result in the complete suppression of Communist propaganda and political activity. The fate which the powerful German Communist party met at the hands of Hitler was fresh in the minds of the Comintern strategists. In their view, the perpetuation of "bourgeois democracy" was more favorable to the early overthrow of the capitalistic system than the world-wide triumph of fascism.

Reports presented to the Congress by representatives of the Communist branches in various countries aroused much criticism and some alarm in anti-Communist circles. Typical of these reports was the statement by Earl Browder, general secretary of the Communist party in the United States, that the Communist movement was gaining a foothold in many apparently conservative labor and political organizations in that country and was making rapid progress. In provocative terms he outlined his party's plans for attacking capitalism through strikes and disturbances. He admitted, however, that the membership of the American party was only 30,000 and that the Communist-controlled labor unions enrolled but 4000 members. Formal approval of these plans by the Congress led the United States Government on August 25 to protest emphatically against the Soviet Government's alleged violation of its pledge of Nov. 16, 1933. In order to secure recognition by the United States, the Soviet Government had then declared that it would be its fixed policy not to permit on its territory the existence of any organization or group "which has as an aim the overthrow of, or the bringing about by force of a change in, the political or social order of the whole or any part of the United States. . . ." The American note said that failure to prevent further violations of this pledge would entail "most serious

consequences." The British, Italian, Latvian, and Japanese governments likewise protested the activities of the Congress.

The Soviet Government, however, bluntly rejected these protests. It advanced the oft repeated contention that the Third International was an organization having no connection with the Soviet régime and that the authorities at Moscow could not interfere with its activities. The United States did not carry out its threat to sever diplomatic relations, apparently because such a step would have encouraged Japan in its aggressive policy in China (see CHINA, JAPAN, and UNION OF SOVIET SOCIALIST REPUBLICS under *History*). Before disbanding, the Congress selected a new executive committee, including Browder, W. Z. Foster, and Gil Green from the United States. Six new national branches of the Communist party were admitted to membership from the Philippines and various Latin American countries. With these additions, the Comintern comprised Communist parties in 65 countries, with a total membership of 3,148,000.

The meeting of the Congress of the Communist International was followed on Sept. 25–Oct. 12, 1935, by the Sixth World Congress of International Youth in Moscow, at which the American Young Communist League was represented. This organization for Communist youth adopted resolutions and policies identical with those approved by the Congress of the Comintern. Early in October the executive committee of the Communist International attempted to organize a world-wide united front with the Socialists to boycott Italy's invasion of Ethiopia. The Socialist International on October 18 rejected this proposal, primarily because of objections raised by the British and Czechoslovak Socialist organizations. The Socialists received the Communist offer in a friendly manner, however, and the Belgian Socialist leader, Louis de Broekere, offered the collaboration of the Socialist International in separate countries.

Communism in Europe. Perhaps the outstanding development in European communism during 1935 was the trend towards democratization of the Communist dictatorship in the Soviet Union. There were numerous evidences that Stalin and his associates were attempting to broaden the base of their support among the people. Preliminary steps in this direction were taken in previous years, particularly in 1934 when the Soviet authorities reorganized the OGPU and began to emphasize national patriotism in contrast with the previous stress upon internationalism of the Communist type. In February, 1935, the Soviet Constitution was amended along distinctly new lines. The masses generally were given a greater voice in national affairs through the establishment of local and central congresses to be elected by universal, direct, and secret voting. Peasants for the first time were to be given equal suffrage with the industrial workers of the towns. In March these reforms were extended from the political to the economic field when statutes were drafted for the establishment in each village of the collective farms of a general assembly, a majority of which might dismiss officials of the collective or veto their acts. In May Stalin struck a further blow at the rigid dictatorship exercised through the Communist party when he declared that a person could be a good Bolshevik without being a member of the party. He also declared it was time to stress human rights and individual welfare, in contrast with the previous emphasis upon successful completion of the Five-Year Plans and the welfare of society as

a whole. Stalin personally led a movement to stabilize family life and to inject more individual happiness and color into the Russian scene.

Compelling motives for these changes in the Communist attitude and philosophy were the danger of war with Germany or Japan and the necessity of insuring the loyalty of the masses in order to tide over such a crisis; the strife between the Stalin and Trotsky factions of the Russian Communist party, which culminated in the assassination of Sergei Kirov on Dec. 1, 1934; and the virtual completion of the basic programme of industrialization and the collectivization of agriculture, making it possible to relax the iron discipline under which these revolutionary changes were brought about. It remained to be seen, however, whether this apparent trend towards greater democracy was of a permanent or temporary character. (Consult Louis Fischer, "Russia Moves Towards Democracy," *Current History*, September, 1935.)

Meanwhile in the rest of Europe the Communist movement for the formation of anti-Fascist united fronts was making headway wherever fascism was or threatened to be in ascendancy. The Communist-Socialist agreements of 1934 for united action in France and Spain continued in force, and in France it was extended to include the left-wing Radical Socialists. In July the Laval Government's economy decrees, enforcing wage cuts in the naval arsenals and the subsidized French Line, led to violent strikes in Brest and Toulon in which six workers were killed and many injured. The Communists took a prominent part in these events, and many Radical Socialists and Socialists expressed fear that they had abandoned leadership to the Communists by joining in the so-called Popular Front.

In Austria the Social Democrats, driven underground after the civil war of February, 1934, finally concluded a united front agreement with their old enemies, the Communists, in July, 1935. But in Great Britain the powerful Socialist Trade Union Congress voted to exclude Communists from official positions in the unions and the Labor Party rejected the Third International's proposal for a united front boycott of Italy's Ethiopian venture. The British Communist party nevertheless supported the Labor party in the British general election and early in December it applied for affiliation with the Labor party. In the Irish Free State the radical wing of the Republican movement was displaying Marxist tendencies increasingly. The strong Communist movement in Greece was driven underground by the Kondylis dictatorship during 1935, but it again obtained a legal political status following the restoration of George II. Despite repeated ruthless extirpations of Communist conspirators in Bulgaria, the movement continued to gain formidable strength. In general it remained true that in the countries of Scandinavia and western Europe where representative government held sway, the Communist movement represented minorities too small to constitute an immediate threat to existing political institutions.

North America. Immediately following his return from the Seventh Congress of the Third International at Moscow, Earl Browder announced that the Communist Party of America would support the movement for union with the Socialists and Farmer-Labor organizations in establishing a third party for the 1935 elections. He made it clear that the Communists would support a Farmer-Labor party "as a bulwark against reaction, not as an instrument for introducing socialism." The

Communist overtures towards the Socialists widened the breach between the conservative and radical factions of the Socialist party and led to the beginning of an apparently irreparable split (see *SOCIALISM*). The majority faction of the Socialists, under the leadership of Norman Thomas, appeared to be favorable to a united front with communism.

Meanwhile Communist agitators were reported to be active among government relief workers, military and naval forces, sharecroppers of the South, the itinerant fruit pickers of California, and many other working class groups. Their activities were accompanied by an apparently increasing demand on the part of conservative civic and patriotic organizations for legal steps to repress or obstruct Communist agitation. Secretary of the Navy Swanson as well as various army and navy officers appeared before a House Committee at Washington in support of a bill to curb Communist propaganda. A subsequent survey, however, indicated that danger of such propaganda in the Navy was negligible. In response to the Comintern's announced plans for "boring from within" the conservative labor unions, the American Federation of Labor amended its constitution so as to bar Communists from State and central labor bodies, formally aligned itself with the American Legion in the latter's fight against "communism and other subversive influences," and selected Minneapolis as the scene of its first drive to "purge" labor organizations of Communistic influences. The national convention of the American Legion in September again demanded anti-Communist legislation. A bitter attack upon communism as the foe of the Roman Catholic Church was made by Alfred E. Smith, former governor of New York, at the seventh national Eucharistic Congress in Cleveland in September. A host of other groups and organizations joined in the anti-Communist crusade, with the result that bills requiring teachers to swear loyalty to the Constitution were passed in a number of States and more drastic legislation was in prospect.

Several outstanding examples of the mounting anti-Communist hysteria aroused nation-wide comment during the year. California's famous criminal syndicalism law, originally adopted to curb the Industrial Workers of the World, was invoked in January against 17 Communists, who were indicted at Sacramento on charges of attempting to overthrow the government of the United States by force and violence. Rounded up and arrested shortly after the general strike in San Francisco in 1934, they included several leaders of successful strikes among the California fruit pickers in 1933. The four-months' trial ended on April 1, when eight of the defendants were convicted. The State's action in the case, supported by the American Legion, the Associated Farmers, the State Chamber of Commerce and other conservative groups, aroused widespread criticism from liberal spokesmen and the liberal press. In August five alleged Communists were tarred and feathered or beaten by vigilantes near Santa Rosa, Calif.

The flogging to death near Tampa, Fla., on November 30 of Joseph Shoemaker, a labor organizer, aroused even greater discussion. Shoemaker and five companions were arrested in a private home, without a warrant, by a police raiding party for questioning concerning alleged Communistic activities. Released after a short time, Shoemaker and two others were abducted outside of police headquarters by a band of men, who flogged them

severely and then applied tar and feathers. Six Tampa policemen were arrested on December 18 in connection with Shoemaker's death. In Georgia, the State's anti-sedition statute of 1866, under which the Negro Communist, Angelo Herndon, was sentenced to 18 to 20 years in prison in 1934 for organizing a relief appeal by white and Negro families, was declared unconstitutional on Dec. 7, 1935, by Judge Hugh M. Dorsey at Atlanta.

In Canada the march on Ottawa organized during June and July by the unemployed from the western provinces was denounced as "communistic" by Premier Bennett and was broken up by the Royal Canadian Mounted Police, after severe rioting.

Latin America. In Latin America Communist propaganda appeared to be making considerable headway. The Brazilian authorities made sensational charges concerning the abortive revolt of November, 1935, which was said to have been guided and financed by the Soviet Legation at Montevideo, the capital of Uruguay. Some foreign observers reported that the insurrection aimed at liberal and democratic reforms rather than communism and pointed out that Latin American governments customarily labeled all opponents as Communists. However the Brazilian Government, with the support of Congress and the press, adopted drastic measures to root out radicals and alleged Communists, even arresting several noted feminist leaders. A direct result of the Brazilian rising was the Uruguayan Government's action of December 27 in severing diplomatic relations with the Soviet Union and requesting the Soviet Minister and his entourage to leave the country. Brazil had made representations to Montevideo concerning the Soviet Minister's alleged connection with the Brazilian revolt. Argentina and other countries had also protested the dissemination of Communist propaganda from Montevideo.

The death on December 17 of Dictator Gomez of Venezuela was reported to have been followed by the rapid spread of Communistic doctrines. In Chile the Communist party remained a constant threat to the government, and most other governments of Latin America resorted to repressive measures against any one suspected of entertaining Communistic or radical ideas. Costa Rica was one of the few countries where the party remained legal, and there it entered a candidate in the presidential election scheduled for early in 1936. In fact fascism appeared to be making much greater headway than communism throughout Latin America.

The Far East. In China communism made steady headway during 1935, despite the success of the Nationalist Government in driving the Communist armies into the western provinces from their former strongholds in Kiangsi and Fukien. Communistic doctrines were also reported to be gaining many adherents among Chinese students and intellectuals in areas under the Nanking régime's control notwithstanding the cruelly repressive measures enforced to check the movement. The rapid extension of communism was one of the prime factors driving Japan on in her policy of imperialistic expansion in the Far East and her preparations for war with the Soviet Union (see *CHINA, JAPAN, and MONGOLIA under History*). In Japan the police continued their periodical anti-Communist roundups. On November 12 they announced the arrest of 88 youths whom they charged with membership in a secret Communistic society.

For more detailed accounts of Communist activities in the countries mentioned above, see the

article on each country under *History*. Also see *FASCISM*; *SOCIALISM*.

COMORO ISLANDS. See under *MADAGASCAR*.

COMPANY UNIONS. See *TRADE UNIONS*.

CONGO, BELGIAN. A Belgian colony in Central Africa. Area, 920,656 sq. miles; population, 9,467,503 natives and 17,588 Europeans (Jan. 1, 1934). Chief towns: Leopoldville (capital), Matadi, Elisabethville, Jadotville, Stanleyville, and Coquilhatville. In 1933 there were 4107 government and subsidized schools with 208,074 students.

Production and Trade. Palm oil, cotton, rice, coffee, cacao, rubber, copal gum, and sugar were the main agricultural products. Mineral production (1934): copper, 110,000 metric tons; tin, 4500 tons; diamonds, 2,000,000 carats; gold, 11,672 kilograms; cobalt, uranium, radium, and iron were also produced. In 1934, imports were valued at 377,606,441 francs; exports, 843,315,648 francs (5 paper francs were equivalent to 1 belga which averaged \$0.2329 for 1934).

Communications. The river Congo and its tributaries were an important means of transportation. In 1934 there were 2894 miles of railway line and 26,573 miles of highways.

Government. For 1935, revenue was estimated at 529,459,675 francs; expenditure, 681,667,000 francs. On Jan. 1, 1935, the public debt was 3,785,500,383 francs. The colony was administered by a governor-general who represented the King. A colonial council of 15 members was presided over by the Belgian Minister for the Colonies. Governor-General in 1935, Pierre Ryckmans. See *RUANDA-URUNDI*.

CONGO, FRENCH. See *FRENCH EQUATORIAL AFRICA*.

CONGREGATIONAL AND CHRISTIAN CHURCHES. THE GENERAL COUNCIL OF THE. A general council was instituted at Seattle, Wash., June 26, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The formal existence of the former organizations, however, was continued for the time being against possible legal necessities. The general council was to carry on the administrative affairs of the united churches but true to traditions with no ecclesiastical authority, as the plan of union provides for local autonomy in the individual church and in groups of churches associated together. For the early history of these churches consult *THE INTERNATIONAL ENCYCLOPEDIA*, vol. v, pp. 285 and 737 ff. and *THE NEW INTERNATIONAL YEAR BOOK* for 1932.

In November of 1935 a plebiscite of the constituency was taken to determine the mind of those participating on the question of war. About 200,000 participated in the plebiscite. It showed 6 per cent prepared to respond to any call of the country to arms; 42 per cent willing to support the government in a war declared after exhausting the possibility of peace; 33 per cent ready to fight in case of invasion of the country, and 15 per cent determined to refuse cooperation in the event of any war.

The officers for the biennium ending in June, 1936, are: Honorary Moderator, Dr. S. Parkes Cadman, Brooklyn, N. Y.; moderator, the Rev. Jay T. Stocking, St. Louis, Mo.; assistant moderator, the Rev. Stanley C. Harrell, Durham, N. C.; secretary, the Rev. Charles E. Burton, New York City; associate secretary, the Rev. Frederick L.

Fagley, New York City; assistant secretary, the Rev. Warren H. Denison, Dayton, Ohio; and treasurer, William T. Boulton, New York City.

Statistics for the Congregational and Christian churches as of Jan. 1, 1935, showed 6282 churches, 6059 ministers, and a church membership of 1,029,002. There were 3414 young people's societies, with a membership of 189,330. The Sunday school enrollment was 734,146. The total raised for all benevolences was \$2,035,923, and the home expenses of the churches were \$13,305,260.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in the United States, having been organized June 29, 1810. On Jan. 1, 1935, there were 14 missions under 8 different flags; the stations connected with these missions numbered 88 and the outstations 2096. The missionaries holding life appointments numbered 508 and included 115 ordained men, 61 unordained men, 171 wives, and 161 single women. There were also 30 associates serving for shorter periods, bringing the total number of missionaries up to 538, while native workers numbered 7040. Religious services were conducted in 2588 places. The organized churches numbered 780, with 103,283 communicants. The total church constituency numbered 388,971; Sunday schools, 1237; theological seminaries and training schools, 30, with an attendance of 1549 students; colleges, 9, with 3846 students; secondary schools, 52, and primary and elementary schools, 970, with a total enrollment of 62,953. There were 28 hospitals and 44 dispensaries, with a staff of 40 physicians and 27 foreign nurses.

A wide range of home missionary activities is carried on by the Church Extension Boards, including the Congregational Home Missionary Society, the Congregational Church Building Society, and the Congregational Sunday School Extension Society. They organize churches, establish church schools, aid needy congregations in the support of their ministers, give specialized service to foreign-speaking groups and to Negroes in the North, and assist in church and parsonage building. In 1934 these societies helped to maintain 605 churches and preaching stations, having a total membership of 32,181, and received 2437 persons into church membership. There were enrolled 434 workers, including students employed for short-term summer service. Expenditures for church and parsonage aid amounted to \$217,829; total expenditures, including payments from revolving funds, amounted to \$575,024.

Among the theological seminaries with which the Congregational and Christian denominations are affiliated are the Chicago Theological Seminary, Divinity School of Yale University, Hartford Theological Seminary, Oberlin Graduate School of Theology, Atlanta Theological Seminary Foundation (Nashville, Tenn.), Union Theological College (Chicago), and the Pacific School of Religion (Berkeley, Calif.). In addition there are 43 colleges which have had some historical relation to the Congregational and Christian Churches, although a number of them are now undenominational.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City, with a regional office in the Christian Publishing Association Building in Dayton, Ohio. The Congregational Publishing Society, which issues *The Advance*, maintains branches at 14 Beacon St., Boston, and at 19 South La Salle St., Chicago.

CONNECTICUT. Population. On Apr. 1, 1930 (Fifteenth Census), 1,606,903; July 1, 1934, by latest Federal estimate, 1,655,000; 1920 (Census), 1,380,631. Hartford, the capital, had (1930) 164,072 inhabitants; New Haven, 162,655.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. Bu</i>	<i>Value</i>
Hay (tame)	1935	251,000	353,000 *	\$5,719,000
	1934	250,000	336,000 *	6,250,000
Tobacco	1935	12,100	16,905,000 *	5,577,000
	1934	10,200	14,758,000 *	5,281,000
Corn	1935	54,000	2,160,000	1,728,000
	1934	52,000	2,132,000	1,961,000
Potatoes	1935	15,000	1,980,000	1,485,000
	1934	15,000	2,625,000	1,575,000
Apples	1935	805,000	845,000
	1934	356,000	538,000

* Tons. * Pounds

Education. The number of the inhabitants of school age was reckoned, for the year ended June 30, 1935, as 350,719; the included ages were those from 4 to 16 years. The enrollments of pupils in the public schools numbered 321,831. Of these, 16,556 were in kindergartens; 207,010, in elementary schools; 24,356, in junior high schools; 73,909, in other high schools. The expenditures of the year for public-school education throughout the State totaled \$29,880,308. The yearly salaries of teachers averaged \$1429 in kindergartens, \$1392 in elementary positions, \$1696 in junior high schools, and \$1898 in the other high schools.

Charities and Corrections. As required by State laws of 1935, the office of Commissioner of Welfare was created to take the place of the previous Department of Public Welfare and Department of State Agencies and Institutions. A Public Welfare Council was made the advisory collaborator of the new Commissioner (C. F. Walcott). Under him were organized divisions to attend to the State's new system of old-age assistance, aid to widows, State aid to paupers, institutional collections, adult welfare, child welfare, and research and statistics.

The State owned and operated the following institutions for the care and custody of persons. Connecticut State Prison, at Wethersfield, and Osborn Prison Farm, at Enfield, with a population of 749 for both; Connecticut State Farm for Women (offenders), Niantic, 293 inmates; Connecticut School for Boys (delinquent), Meriden, 325; Long Lane Farm (delinquent girls), Middletown, 214; Connecticut Reformatory (young men, to 25 years), Cheshire, 308; for the mentally disordered, State Hospitals at Middletown (3156 inmates), Norwich (2906), and Newtown (483); for epileptics and the feeble-minded, Mansfield State Training School and Hospital, at Mansfield, 1164; Mystic Oral School, Mystic, 105; Fitch's Home for Soldiers and Sailors, Noroton Heights and Rocky Hill, 584; five Tuberculosis Sanatoria, 1334.

Legislation. The Legislature enacted a system of pensions for needy old people, designed to bring the State into conformity with Federal provision for aid toward such pensions. The State's law for the regulation of the liquor traffic was revised to permit the serving of liquor by the drink in hotels, restaurants and clubs; these places, however, did not gain permission to sell over the bar; whether they might serve liquor on Sundays was made subject to local option. The existing system of licensed taverns with bars for the sale of beer but not of liquors was retained. Cigarettes were sub-

jected to a State tax of 2 cents on each package of twenty.

Fairfield County was authorized to issue \$15,000,000 of bonds with which to obtain money from the Reconstruction Finance Corporation for the early completion of its projected Merritt Parkway; the authorizing act required that the road run from the boundary of New York State to the Housatonic River, that it be restricted to non-commercial vehicles, and that it be not routed straight, but laid out with regard to landscape. The Legislature rejected certain laborite measures, such as a provision for "prevailing rate of wages," to be fixed by a State board, on State and local road work, and a limitation of women's work in factories to 48 hours a week. It also rejected a bill to qualify the State for the application of Federal rural rehabilitation. The administration of *Charities and Corrections* (q.v.) was put in the hands of a single Commissioner of Welfare aided by an advisory board.

Political and Other Events. The tercentenary of the white man's first settlement of Connecticut was marked by observances in the chief parts of the State, spread through much of the year. A composite photograph of the entire surface of the State, taken by airplanes, was put together in the form of a map and displayed at a tercentenary industrial exposition at Hartford. The economic conditions improved during the year, although the State was not the scene of any particularly great direct Federal scheme of expenditure. The number of "families" dependent on public relief for the unemployed declined but was still 36,780 (comprising about one-tenth of the population) in June. The State had carried nearly half the cost of such succor in 1934, the Federal Government paying 51.3 per cent. This policy was continued; it did not necessitate measures of State legislation, for local funds made up more than four-fifths of the State's share.

Elections held on October 7 for filling local offices indicated a moderate trend toward the Republican party. Torrington, Danbury, and Stonington went Republican, but Wallingford went Democratic.

Officers. The chief officers of the State, serving in 1935, were: Governor, Wilbur L. Cross; Lieutenant-Governor, T. Frank Hayes; Secretary of State, C. John Satti; Treasurer, John S. Addis, Comptroller, Charles C. Swartz; Attorney-General, Edward J. Daly.

Judiciary. Supreme Court of Errors: Chief Justice, W. M. Maltbie; Associate Justices, F. D. Haines, G. E. Hinman, John W. Banks, Christopher L. Avery.

CONNECTICUT COLLEGE. A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut. The enrollment for the autumn of 1935 was 650. The faculty numbered 71 members. The productive funds amounted to \$1,460,205, and the budget for the year, not including building operations, was \$604,137. There were 65,000 volumes in the library. In 1934-35 the college received approximately \$18,000 in miscellaneous gifts. A new greenhouse and plant hormone laboratory for teaching and research, built from a Rockefeller Foundation grant and additional gifts, was opened for use in September, 1935. President, Katharine Blunt, Ph.D.

CONTRACT BRIDGE. Oswald Jacoby was the outstanding American contract bridge player in 1935, a year in which the game reverted more to the status of a game than to a highly publicized sport wherein ballyhoo played such an important part.

Jacoby, probably the most dynamic of the well-known players, was winner of the open pairs championship at Chicago, winner of the individual masters' trophy, member of the winning team in the Vanderbilt Cup competition as well as one of the invincible Four Aces who capped the year by defeating a picked French team in New York in December. These achievements netted Jacoby 109 masters' points in the accumulative tally kept by the American Bridge League. On that basis, B. Jay Becker was second for 1935, with Theodore A. Lightner third. The next few in line were Edward Hymes, jr., Louis H. Watson, Waldemar von Zedtwitz, Louis J. Haddad, and Charles Hall.

The lone carnivals of the year were the United States-France match and the set match between Mr. and Mrs. Hal Sims and Mr. and Mrs. Ely Culbertson. In the latter the Culbertsons downed the Sims pair. In the former, the first few days all the play, with the exception of the final six hands of the match, was done in a quiet hotel room. But the final night's play was staged in Madison Square Garden with life size cards, carried by walking ushers, illustrating the play taking place in an inside room. The public address system was used to show the play and to direct the living cards. There was small attendance and the failure of the effort to bring bridge into the "games to be watched" category showed conclusively that the game is to be played rather than seen. The winning United States team was made up of Jacoby, David Burnstine, Michael Gottlieb, and Howard Schenken, and the French team presented Emmanuel Tulu-maris, Baron Robert de Nexon, Sophie Venizelos, Georges Rousset, and Pierre Albarran. The United States margin at the finish was 2810 points.

CONTRACTS. See LAW.

COONTZ, ADM. ROBERT EDWARD, U.S.N., RET. An American naval officer, died at Bremerton, Wash., Jan. 26, 1935. Born at Hannibal, Mo., June 11, 1864, he was educated at Ingleside College, Palmyra, Mo., from 1878 to 1879, and at Hannibal College from 1879-80. He then entered the U.S. Naval Academy at Annapolis, graduating in 1885. He was commissioned an ensign on July 1, 1887, and first detailed for duty on the *Mohican* and sent to Panama. The intense heat there disagreed with him and he was transferred to Sitka, Alaska, where he remained for six years. As a result of his experiences there, his knowledge of Alaskan waters was so detailed, that he qualified as a pilot. When the United States fleet went around the world in 1908, he served as executive officer on the *Nebraska*, and in 1910 was appointed Commandant of the midshipmen at Annapolis, serving until 1911.

He was made Governor of Guam in 1912, and upon his arrival introduced himself as a "hanging governor" believing that only by strong measures would he be able to stop the "crime wave." At the expiration of his year's term of office, the crime wave had ceased, and he was transferred to sea duty. He was made commanding officer of the *Georgia*, which won the fleet gunnery trophy in the manoeuvres of 1913. In July, 1915, he was appointed commandant of the Puget Sound Navy Yard, and served there until he was ordered to command the 7th Division, U.S. Atlantic Fleet in August, 1918. Also, he was then assistant for Naval

Operations and had reached the grade of Rear Admiral.

Admiral Coontz' appointment by Secretary of the Navy Daniels as Chief of Naval Operations, with the rank of full admiral, was confirmed by the Senate, Oct. 24, 1919. He held this post until July 21, 1923, and while head of this department worked for the strengthening of his office and for the adoption of a definitive naval policy, being a firm advocate of a big navy. After the Limitation of Arms Conference at Washington in 1921-22, he fought for the prevention of the reduction of the enlisted personnel of the United States Navy to 86,000, and considered his victory one of the accomplishments of his régime.

On Aug. 4, 1923, he succeeded Adm. Hilary P. Jones as commander-in-chief of the United States fleet which was then the largest concentration of naval power ever assembled under the American flag. He commanded it on its Hawaiian-Australian-New Zealand cruise and presented an extensive report criticizing certain deficiencies in the navy and holding that a uniform speed for ships was necessary. A general inquiry conceded the correctness of his observations. On Aug. 3, 1925, he was relieved of his duties as commander of the fleet, and on November 30 was assigned to the 5th Naval District at Hampton Roads, Va., as commandant. He retired in 1928 with the rank of rear admiral, and in 1930 was advanced on the retired list to the rank of admiral. In this same year, testifying before the Senate Committee on Naval Affairs, he reiterated his belief in the efficacy of a strong navy.

For his services to his country during his naval career, Admiral Coontz was awarded the Spanish-American War Medal, the Philippine Insurrection Medal, the Vera Cruz Medal, and the Distinguished Service Medal. On Oct. 15, 1923, he was awarded the Distinguished Service Medal of the American Legion. He was commander-general of the Military Order of Foreign Wars from 1920 to 1923, and commander-in-chief of the Spanish-American War veterans from 1932 to 1933. His biography, *From the Mississippi to the Sea*, appeared in 1930.

COÖPERATION. Since there is no routine system of reporting data on the cooperative movement in the United States, reports of activities reach journals and other private sources at irregular intervals. Five aspects of the American cooperative activities will be reported in this article: Productive enterprises, coöperative wholesale enterprises, cooperative housing enterprises, cooperative credit associations, and consumer coöperatives.

Productive Enterprises. In spite of the fact that it would be logical for workers' productive enterprises to decrease in number during the depression, there was a net loss of only two societies between 1929 and the end of 1933. At that time there were 18 such organizations in active operation. A detailed survey of eight of these, made by the Bureau of Labor Statistics, clearly shows the nature of these enterprises. These eight organizations had 1181 shareholders, of whom 47 were employed in the coöperative enterprises, and 650 non-shareholder employees. During the year they paid wages to a total of \$772,073. With a share capital of \$1,234,704 and reserves of a trifle over one half a million dollars, they did a business of \$3,629,470, an average of \$483,684 per society. As a group, they lost money to a total of \$86,938. However, comparison with earlier years shows a gain in the average number employed, in average share capital

and in average amount of sales, and, while not yet profitable in all instances, the enterprises showed average sales in 1933 above the 1929 level. The enterprises have been severely handicapped by lack of business experience, of knowledge of salesmanship and of market conditions, as well as lack of adequate working capital.

The producing coöperative differs from a consumers society in that it is not desirable to increase the number of members constantly. On the other hand, the necessity is to increase the volume of business, thus decreasing the overhead expenses and increasing the benefits accruing to each member. New members are, therefore, likely to be looked upon as reducing the profits of others, especially if the society achieves business success. Moreover, in proportion as the operations require high technical skill, the field for new members is restricted, especially if it is the rule that all members be experts in the manufacturing processes. This applies, for instance, in the manufacture of shoes, handmade window glass, and in the production of ply board. For this reason, the B.L.S. study suggests that some of the coöperative companies are in reality more of the nature of trade unions or even joint stock enterprises than of coöperative work shops.

A summary statement of the kinds of production enterprises operating cooperatively is as follows: Factories for the production of boxes, cigars, clothing, food products, ply wood, shoes, and shingles. In addition, one coöperative coal mine was reported, an enameling plant, and two laundries. Of the 18 societies reporting, the average period for which they had been in existence was 19 years and 3 months, the range being from 13 years to 37 years. As to the number of shareholders, the largest society reported had 565, with an employment roll of 205 plus 231 non-shareholder employees, while the smallest society reported had 8 shareholders, all of whom were employed in the business, as well as 33 non-shareholding employees. It is to be especially noticed that 5 of the 8 societies studied employed more non-shareholders than members.

The average annual earnings were very low, ranging from \$366 to \$927, the general average being but \$704. However, there is no means of telling how far these figures are distorted by the evidence of seasonal employment; and certainly they do not indicate whether or not the workers operated their coöperative enterprises part time and derived a portion of their yearly income otherwise. The work-week ranged from 36 hours to 44. In the case of the shoe factory alone did the business done in the year 1933 top \$1,000,000, and in that instance it was \$1,622,616. On the other hand, the smallest annual business was done by coöperative cigar factories, the two taken together doing a total business of but \$18,798.

The financial control of these coöperative societies lies with the general meeting of the stockholders, usually one vote being allowed to each member. The actual conduct of affairs is in the hands of a board of directors, though frequently the task is delegated to an elected manager, the directors exercising general oversight. The books of the societies are subjected to regular audits, usually by a professional accountant.

Coöperative Wholesale Societies. Turning to coöperative wholesale organizations the reports for the year 1934 show that sales rose 50 per cent over the preceding year and all organizations reporting to the Federal Bureau of Labor Statistics showed profits. As a rule coöperative wholesale

societies are owned and controlled by local retail consumers societies which provide the necessary capital. This phase of the coöperative movement has developed slowly in the United States, the most recent disaster which inhibited invasion of the field occurring in the year 1920-21 as a consequence of an attempt to establish the business on a national scale. This led to the development of the regional approach, since four regional wholesale organizations were able to survive the 1920-21 depression. There are now two regional wholesale societies on the Pacific Coast, one in the South, eight in the Middle West and one in the East. In 1933 an organization called National Cooperatives Incorporated was formed to act as the national wholesale agent for a group of regional wholesale societies, especially in the purchase of petroleum products, tires, batteries, and so on. The nine regional wholesale societies reporting to the B.L.S. stated that at the end of 1934, they had 1334 local members and that they were acting for 349 societies which had not become members although using the wholesale facilities.

The nine regional societies had a paid-in share capital of \$1,368,214, reserves of \$140,695, and total assets of \$2,713,110. The nine societies did a combined business for 1934 amounting to \$15,549,316, the total net trading gain being in excess of \$300,000. They paid out interest to member societies to a total of \$24,967 and also paid out \$120,884 in patronage rebates. Five societies reporting were grouped together for study and it was determined that operating expenses were 9.45 per cent of their sales in 1934, the largest single item being wages—5.1 per cent. Wages paid out total nearly \$600,000 and were disbursed to 375 workers, who labored an average of 41 hours per week.

The coöperative wholesalers handled the following products in considerable volume: petroleum products, automobile tires, tubes, and batteries, flour and feed, salt, twine, paint and varnish, coal, groceries, clothing, bakery products, light hardware, and building materials. It is interesting to note that two of the societies reporting were engaged in the manufacture of lubricating oil, one in the manufacture of feed and one bakery goods.

Coöperative Housing Societies. Turning now to coöperative housing societies, the reports of whose activities as of 1933 became available during the current year, it appears that the median monthly rental for the apartments was between \$40 and \$45 per month, as a rule for a four-room apartment. The members had an investment in the enterprise amounting from \$500 to \$1000 per room. Of the 21 societies furnishing data to the B.L.S., 13 were in Brooklyn and eight were in Manhattan and the Bronx. The oldest was organized in 1916, and the average of all societies reporting was 11½ years. While there were 626 member shareholders, only 484 were occupying apartments in the building, while 203 apartments were rented to non-members. The paid-in share capital amounted to a little over \$900,000 and the present value (end of 1933) of the coöperatively owned building was \$2,629,663. The societies had experienced a decline in the net worth of the building similar to that of other real estate holders.

A word may be said as to the usual method of operating these enterprises. A member is usually required to make a down payment, the balance being paid in monthly amounts as rental and enough to cover interest, a share in the cost of building maintenance, and an instalment on principal. The cost of interior upkeep of the apartments

is generally borne by the members occupying them. Two of the societies reported the initial payment per room was less than \$100, and this ran up in one instance to a down-payment of \$2000 for the apartment. The total cost per apartment was less than \$1000 in one society and ran up to \$8300 in another in calculating the number of rooms. The bathroom was not counted but the kitchen was considered a room, and the dining alcove one-half a room. As a rule, the coöperative apartments have from 3 to 4 rooms.

The City of Washington has two coöperative residential hotels. Each member is required to purchase five shares of preferred stock and one share of common stock, only the latter of which carries the voting privilege. The cost to the member is ranged from \$200 to \$500 per room, of which \$50 must be paid down. Monthly basic rents range from \$25 to \$35. The hotel reporting details has 250 tenants, of whom 100 are stockholders, and 114 stockholders not residing in the hotel. The hotel is managed by a board of directors elected by the members. It operates a cafeteria and provides a laundry room for the use of the guests, maintains an elaborate parlor and ballroom. It is chiefly patronized by young women employed in the House and Senate office buildings.

Credit Societies. The B.L.S. reports that, while unable to make a general survey of all credit societies for 1934, the number continued to increase and the membership of the individual units as well. The survey obtained data from cooperative credit societies in 24 States. Membership data reported for 20 States showed a total membership of 425,000 persons at the end of 1934. The concentration was in Massachusetts, always preeminent among credit union States with 109,434 members, or nearly twice the membership of that of its nearest competitor, Illinois. Massachusetts also was the leader in point of capital, resources and loans. The 24 States reported combined share capital in excess of \$26,250,000 and total assets of above \$40,000,000. Reports covering 1513 societies show that they had served 195,124 borrowers and it is calculated that the total loans of all societies during 1934 was probably about \$40,000,000. As a rule credit unions are cooperative societies making loans to their members only and are designed to furnish a source of credit for small borrowers who lack banking connections. There is usually a top limit of \$50 per loan. It is noticeable that this cooperative development is concentrated in four States—Massachusetts, Illinois, New York, and Wisconsin—which together have 46 per cent of the total number of societies, 60 per cent of the membership, and 61 per cent of the total resources.

Consumers Coöperatives. A report of the Cooperative League of the U.S.A., made in June of 1935, takes satisfaction in the fact that retail authorities addressing the Boston Conference on Distribution predicted a rapid rise of coöperative consumer societies and also in the equally significant development, the benevolent interest of various departments of the Federal government concerned with improving the living conditions of depressed groups. The report stated that membership in consumer coöperatives had increased 40 per cent from 1929 through 1934 and was still rising, the total membership now being in excess of one million and three quarters. It was pointed out that while some personnel was being taken over from the traditional retail organizations, there was a definite tendency to develop new personnel, the Wisconsin organizations having their own training school.

In this connection it is interesting to note that the Wisconsin legislature in 1935 passed a statute requiring the giving of courses in consumer coöperation throughout the public school system from the State University downward. Hereafter no certificates are to be granted for the teaching of courses in economics, social studies and agriculture unless the applicant's course of training has included the subject. The Cooperative League predicts that expansion into the production field is imminent. See AGRICULTURAL EXPERIMENT STATIONS.

COPPER. The smelter production of copper from domestic ores in 1935 was 373,000 short tons and the refinery production of new copper from domestic and foreign sources was 592,500 tons, according to an advance summary issued by the U.S. Bureau of Mines. In order to show mine production by States, figures of the recoverable copper in the mine output of the country have been compiled, as shown in the accompanying table which represents estimated recoverable metal output of the mines and should not be confused with figures of smelter and refinery production.

	1934	1935
Eastern States	10,167	10,025
Central States		
Michigan	do	24,108
Missouri	do	23
Western States:		
Arizona	89,041	135,250
California	285	1,280
Colorado	5,647	7,170
Idaho	766	1,050
Montana	31,633	77,945
Nevada	20,806	35,010
New Mexico	11,815	2,530
Oregon	19	200
Texas	15	17
Utah	43,012	64,210
Washington	7	50
Wyoming	2	1
Alaska	61	3,800
Total	237,407	369,520

The output of recoverable copper by mines in the United States in 1935 amounted to about 369,520 tons, an increase of 56 per cent over the production of 237,407 tons in 1934. The marked increase is accounted for principally by the large gains in production in Arizona, Montana, Utah, and Nevada. All copper-producing States, except New Mexico, had larger outputs in 1935 than in 1934. The decrease in New Mexico was due to the idleness of the Chino mine group, which in 1934 accounted for 82.40 per cent of the total for the State. Activity at copper mines as a whole in 1935 was still low in comparison with years prior to 1932 and amounted to only 42 per cent of the annual average for 1925-29.

The average quoted price for copper for the first five months of 1935 was 9 cents a pound for Blue Eagle copper delivered at Connecticut destinations. Late in June the price dropped to 8 cents a pound, where it remained until August, when it began to rise. The average monthly price for November and December was 9.25 cents a pound, the highest quotation for the year. The monthly prices for copper in 1935 indicate an average for the year of 8.88 cents, an advance of 0.22 cent over 1934.

World production of copper, as estimated by *Engineering and Mining Journal*, New York, was about 200,000 tons greater than in 1934. The estimate for 1935 was 1,585,600 short tons; the production in 1934 was 1,381,929 short tons. In 1932, world production was 1,028,491 short tons, of which but 272,005 tons were produced in the

United States. The world annual average over the five-year period 1925-29 was 1,806,686 short tons, of which 892,730 tons, or 49 per cent came from United States mines. In 1935 African production was estimated at 288,000 tons (292,525 tons in 1934); the Chilean estimate was 285,000 tons (282,303 tons in 1934). Canadian production in 1935, as reported by the Dominion Bureau of Statistics, totaled 209,377 tons as compared with 182,380 tons in 1934.

COPYRIGHT. Registrations for the fiscal year, 1934-35, according to the report of the United States Register of Copyrights, numbered 142,031, as compared with 139,047 for the preceding year. Of these, 51,009 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbered 46,488, those printed abroad in a foreign language, 3283, while the remainder, 1238, were English books registered for *ad interim* copyright. The chief classes of the remaining registration, in order of numerical importance, were: Periodicals, 36,351 numbers; musical compositions, 27,459; dramatic or dramatico-musical compositions, 6501; works of art, including models or designs, 3082; prints and pictorial illustrations, 3120; drawings or plastic works of a scientific or technical character, 2331; photographs, 1973; maps, 1343; motion-picture photographs, 857. The renewals numbered 6661, as compared with 6989 in the preceding year. The fees applied during the year amounted to \$259,881.70. The total number of articles deposited during the fiscal year ended June 30, 1935, was 226,202.

The total receipts of the Register's office for the fiscal year were \$259,881.70, the total expenditures for salaries, \$234,653.47, and for supplies, \$1,372.97.

CORINTH. See *ARCHAEOLOGY*.

CORN. Data on the corn production of the different countries of the world in 1935 were still incomplete at the close of the calendar year. The estimated yields of 13 countries reporting to the International Institute of Agriculture amounted to 2,734,672,000 bu. compared with 2,063,724,000 bu. in 1934 and 3,116,272,000 bu., the average annual yield for the five years 1929-33. The production of these countries in 1935 was 32.5 per cent above the production in 1934 but 12.2 per cent below the average for the five-year period. The acreage of the countries reporting, 123,753,000 acres, was 5.4 per cent above the acreage of 1934 but 6.1 per cent below the average for the five years mentioned. The 1935 production of the leading countries of this group exclusive of the United States was reported as follows: Rumania 188,969,000 bu., Italy 90,749,000 bu., Hungary 56,563,000 bu., and Bulgaria 39,722,000 bu. According to the latest reports available the Soviet Republics in 1933 produced about 189,000,000 bu. on 9,777,000 acres. The Argentine crop harvested in April and May, 1935, was reported as 450,769,000 bu.

The 1935 corn production of the United States was estimated by the Department of Agriculture at 2,202,852,000 bu., larger by 60 per cent than the short crop of 1,377,126,000 bu. in 1934 but still 14 per cent smaller than the average of 2,562,147,000 bu. for the five years 1928-32. These estimates included the production of grain and the acreage harvested for silage, fed green or as fodder and used for hogging down or grazing expressed in terms of bushels of grain. The 1935 acreage of corn for all purposes was increased about 5.6 per cent over that of 1934 and was estimated at 92,727,000 acres compared with 87,795,000 acres in 1934 and 102,768,000 acres, the average for the five-year period. The

yield per acre of the total corn area harvested in 1935 was 23.8 bu. per acre compared with 15.7 bu. in 1934, when excessive and wide-spread drought prevailed, and 25.7 bu., the average for the 10 years 1923-32. Drought conditions and fall frosts reduced yields in most of the important corn producing States west of the Mississippi River and frosts in the northern part of the corn growing region coupled with wet weather interfered with proper ripening, lowered quality, and delayed husking. Preliminary estimates for the 1935 crop marketing season placed the average farm price per bushel at 57.7 cents while the average price received by farmers during the crop marketing season of 1934 was 81.6 cents. On this basis the total values of the crops were \$1,271,089,000 and \$1,124,321,000 respectively.

The 1935 production of the principal corn growing States on a grain yield basis was reported as follows: Iowa 352,425,000 bu., Illinois 288,382,000 bu., Indiana 153,444,000 bu., Minnesota 148,431,000 bu., Ohio 133,980,000 bu., Nebraska 105,570,000 bu., and Texas 105,358,000 bu. These States also ranked first in the production of grain but not in the same order, Minnesota changing places with Ohio and Nebraska with Texas. The total corn silage production in 1935 was estimated at 33,370,000 tons, or 96,000 tons less than the production in 1934. The leading States and the tonnage produced were given as follows: Wisconsin 8,555,000 tons, New York 3,924,000 tons, Iowa 3,164,000 tons, Minnesota 3,138,000 tons, Pennsylvania 2,176,000 tons, and Illinois 1,936,000 tons.

During the fiscal year ended June 30, 1935, the United States exported 1,856,000 bu. of corn, 117,000 bbl. of corn meal, 1,813,000 lb. of corn breakfast foods, 10,334,000 lb. of hominy and corn grits, 880,000 lb. of corn oil, 27,899,000 lb. of corn sirup, 4,411,000 lb. of corn sugar, and 39,932,000 lb. of corn starch and corn flour. During the fiscal year 6,510,000 bu. of corn were imported compared with 125,000 bu. for the preceding fiscal period.

In cooperation with the United States Department of Agriculture the Iowa Agricultural Experiment Station has developed and distributed to seed growers four corn hybrids which appear especially adapted to different parts of the State. The Minnesota Agricultural Experiment Station has originated a new variety named Minhybrid which withstands lodging, ripens uniformly, and is giving high yields in southern Minnesota. The results of experiment station work in the northern States indicate that the use of phosphatic fertilizers tends to advance materially the maturity of corn. Several experiment stations cooperating with the Department of Agriculture are working on means of controlling the European corn borer without adding materially to the cost of growing the crop. Illinois, Kansas, Missouri, Nebraska and other mid-western States are enforcing corn borer regulations to prevent the introduction of this insect pest.

CORNELL UNIVERSITY. A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 5768 students enrolled in the autumn session of 1935, distributed as follows: Graduate school, 654; law school, 200; medical college, the main division of which is in New York City, 286; arts and sciences, 1774; architecture, landscape architecture, and fine arts, 147; engineering, 789; veterinary medicine, 129; agriculture, 1218; and home economics, 626, including 198 in hotel administration. Of these students 1304 were women. The 1935 summer session registration was 1652.

The faculty, composed of 1333 members, had 35 professors emeritus; 297 professors, 226 assistant professors, 14 lecturers and associates, 373 instructors, and 388 assistants. The Messenger lectures on the evolution of civilization were given by Prof. Wesley C. Mitchell of Columbia University.

The productive funds on June 30, 1935, amounted to \$29,882,275. The income applicable to current expenses was approximately \$7,500,000, including \$2,479,940 of State, and \$447,553 of Federal appropriations. Gifts amounting to \$761,585 were received during the fiscal year. The land and buildings were valued at \$18,696,814, and the equipment at \$6,492,029. The library contained 935,000 volumes. President, Livingston Ferrand, M.D., LL.D.

CORPORATIONS. See **LAW**.

CORPORATIVE STATE. See **AUSTRIA**, **ITALY**, and **PORTUGAL** under **History**.

CORSICA. An island department of France in the Mediterranean, 100 miles southeast of Nice. Area, 3367 sq. miles; population (1931), 297,235. Ajaccio, the chief city, had 23,917 inhabitants. Ajaccio, Porto Vecchio, and Bonifacio are among the naval stations of France.

COSMIC RAY. See **PHYSICS**.

COSTA RICA, kōs'tā rē'ka. A Central American republic. Capital, San José.

Area and Population. With an area of about 23,000 square miles, Costa Rica had an estimated population of 565,427 on Jan. 1, 1935 (471,525 at the 1927 census). The population of the central plateau, where are found the capital and most of the other cities, is largely of Spanish and European descent. There are some 18,000 Negroes from the British West Indies in the Atlantic banana zone and about 3000 Indian aborigines. Living births in 1934 numbered 23,858; deaths, 10,020; marriages, 3513. The chief towns, with their 1934 populations, were: San José, 68,724 (with suburbs), Cartago, 17,890; Limón, 16,203; Heredia, 14,318 (with suburbs); Alajuela, 9782; Liberia, 8875; Puntarenas, 8127. In 1933 there were 579 primary schools, with 53,700 pupils; two secondary and one normal school, with 1618 students; and two colleges (at Cartago and Alajuela). Fifty-three additional school houses were under construction in 1934.

Production. Agriculture and cattle raising are the chief occupations, but there is considerable lumbering and mining. The principal export products in order of their importance are coffee, bananas, cacao, hardwoods, gold, and hides. Coffee exports in 1933-34 totaled 271,747 bags (of 112 lbs.), against about 367,945 bags in the year ended Sept. 15, 1935. Corn, sugar cane, rice, potatoes, and tobacco are other crops. Cattle in the country in 1935 numbered 365,589. Considerable gold and silver is mined. There were 6532 industrial establishments in 1929, the manufacture of shoes, soap, and candles being the chief lines.

Foreign Trade. Imports in 1934 were valued at 37,061,624 colones (28,874,978 in 1933) and exports at 36,958,640 colones (48,571,775 in 1933). In contrast with the normal favorable balance of trade (amounting to 19,696,797 colones in 1933), the 1934 imports exceeded exports by 102,984 colones. The value of the chief exports in 1933 was: Coffee, 36,271,432 colones; bananas, 9,016,104 colones; and cacao, 1,966,148 colones. Trade is chiefly with the United States, Great Britain, and Germany. In 1934 exports to the United States were valued at \$2,101,810 and imports from the

United States at \$3,125,508. The respective 1935 figures were \$3,089,140 and \$2,321,629.

Finance. Public revenues in 1934 totaled 26,412,115 colones and expenditures 26,685,865 colones, leaving a deficit of 273,750 colones. Of the total income, Customs duties provided 13,012,341 colones; the national distillery, 3,338,975; the Pacific Railway, 3,277,163 colones. The service of the public debt took 3,223,580 colones and public education 6,107,905 colones. On June 30, 1933, the total public debt was reported at 107,885,014 colones.

Communications. Costa Rica in 1934 had 413 miles of railway line; the Pacific Ry. from San José to Puntarenas (81 miles) was state owned. Operating receipts of the Pacific Ry. in 1934 were 3,277,163 colones and expenditures 2,484,055 colones. Fifty-five miles of new highway were completed during 1934, including an important automobile road between Zapote and Villa Quesada. An air line from San José to Puntarenas connected with the inter-American air network.

Government. Executive power is vested in a president elected for four years and legislative power in a Congress of 43 members, half of whom are elected (for four-year terms) every two years. Voting is secret and direct and two Communists won seats in Congress in the election of February, 1934. President in 1935, Ricardo Jiménez Oreamuno, who assumed office May 8, 1932.

History. The exchange problem was the major political and economic issue confronting Costa Rica in 1935. The existing system for the control of foreign exchange transactions was modified by the decree of Feb. 23, 1935, which required exporters and other holders of exchange to deliver it to the Exchange Control Board. The Board allocated exchange for imports and other necessary requirements. Due to the excess of imports, however, the demand for exchange greatly exceeded the supply. Consequently about Mar. 1, 1935, the exchange value of the colon began to depreciate rapidly from the official rate of 4.50 colones to the dollar. Towards the end of August it reached a level of about 7 colones to the dollar and it fluctuated near that point during the rest of the year.

The depreciation of the colon had wide repercussions upon Costa Rica's economic life. Imports declined, despite the depletion of stocks; Customs revenues—the principal source of government receipts—fell off sharply; prices of many imported commodities increased; and the financial situation of the coffee growers and other producers of export crops became more favorable. In order to sustain its revenues, the Government was forced to raise the consumption tax on beer and gasoline and to increase other taxes. At the same time it restricted expenditures on public works and other projects, leaving a considerable number of workers unemployed.

In his message of May 1, 1935, to Congress President Jiménez attacked the exchange control law as a failure. He blamed the situation upon the heavy and uncalled for increase in imports by merchants during 1934 and pointed out that the colon could not be stabilized until a favorable trade balance was restored. However he opposed the restriction of imports through operations of the Exchange Control Board, asserting that this would transform the state into an immense bureaucratic machine. Proposals for stabilizing the colon by the borrowing of a large exchange equalization fund were discussed towards the end of the year.

The Government continued its efforts to combat

the growth of communism by social legislation and economic measures. In June it obtained 250,000 acres of land from the United Fruit Co. for distribution to landless peasants. Early in the year the Government entered into an agreement with the United Fruit Co., under which the company undertook to develop banana plantations on the Pacific coast. As a precaution against further social disorders, such as the violent strike of banana workers in 1934, Congress in September appropriated \$40,000 for the rearmament of the Costa Rican army of 500 men.

With the presidential election scheduled for February, 1936, Dr. Jiménez urged in his annual message that the Constitution be again amended so as to permit the election of the candidate receiving the largest number of votes, provided these votes comprised from 33 to 35 per cent of the total. The constitutional amendment of 1934 permitted the election of a presidential candidate who received 40 per cent of the votes cast. Due to the number of candidates, it is seldom that one of them receives a clear majority in the presidential balloting. Naturalization requirements were tightened to bar the influx of foreign agitators. By the constitutional amendment of July 20, 1935, the residence period before naturalization was increased from one to five years. Negotiations for a peaceful settlement of the old boundary dispute between Costa Rica and Panama continued during the year.

COST OF GOODS. See STATISTICS.

COTTON. The Crop Reporting Board of the U.S. Department of Agriculture estimated on Dec. 8, 1935, that the cotton crop for the United States for 1935 would amount to 10,734,000 bales of 500 pounds, compared with 9,636,000 in 1934, and 13,047,000 in 1933. The acre yield of lint was estimated to average 188 pounds as compared with 170.9 pounds in 1934 and 177.1 pounds, the average for the period 1924-33. Of 27,872,000 acres in cultivation July 1, 1935, 1.9 per cent were subsequently abandoned, and 27,331,000 acres were left for harvest.

The world carry-over of American cotton on July 31, 1935, the New York Cotton Exchange Service estimated, was 9,043,000 bales, compared with 10,746,000 at the end of the previous season and 14,405,000 two years ago. Preliminary estimates of the Bureau of Census, placing the carry-over of American cotton in the United States at 7,138,000 running bales, together with the above estimate of world total indicated the carry-over of American cotton in foreign countries on Aug. 1, 1935, at approximately 1,800,000 bales, about 1,200,000 bales less than on Aug. 1, 1934. The New York Cotton Exchange Service estimated the consumption of American cotton during the season ended July 31, 1935, at 11,249,000 bales compared with 13,680,000 in the previous season and 14,405,000 two years previous.

The total world supply of all cotton for the 1935-36 season was estimated in late October to be about 39,900,000 bales, a little larger than in the previous season and 12 per cent above the average for the decade ended 1932-33 but about 6 per cent smaller than the record supply in 1933-34. World carry-over of all cotton on August 1, about 13,600,000 bales, was 15 per cent smaller than a year earlier, but 34 per cent larger than the 1923-32 average.

The world supply of American cotton for the current season was indicated at about 20,500,000 bales, 200,000 bales larger than in 1934-35 and about equal to the average for the 10 years ended

1932-33, but about 5,500,000 bales below the peak supply of 1931-32. The total stocks of American cotton on hand on Aug. 1, 1935, included about 5,100,000 bales that were government-financed compared with about 3,000,000 bales a year earlier.

Production in bales in 1935 in the countries reporting was officially estimated to be, for the United States 10,734,000; India, 4,479,000; U.S.S.R. (Russia), 2,493,000; China, 2,340,000; Egypt, 1,750,000; Brazil (northeastern states), 1,086,000, total about 1,500,000; Mexico, 235,000; Manchuria, 56,000; Korea (Chosen), 175,000; Turkey, 203,000; Greece, 62,000; Nyasaland, 15,000; and Bulgaria, 39,000. The total world production was estimated by the U.S. Department of Agriculture at the close of 1935 at 25,600,000 bales, about 2,000,000 bales more than the unusually small crop of 1934-35. Estimates of the New York Cotton Exchange Service totaled 25,541,000 bales versus 22,612,000 in 1934-35.

The world's production of commercial cotton in 1934 was estimated by the U.S. Bureau of the Census to be 22,869,000 (478 lb.) bales, of which the United States produced 9,472,000 (running) bales; India, 4,475,000; U.S.S.R. (Russia), 1,673,000; Egypt, 1,566,000; China, 2,150,000; Brazil, 1,332,000; Peru, 310,000; Mexico, 223,000; and all other countries 1,668,000 bales.

The United States cotton crop for 1934, as reported by the Bureau of the Census, the estimated crop for 1935, and the quantity reported ginned to Dec. 13, 1935, are shown in the accompanying table.

States	Crop, 1934 500-lb bales	Crop, 1935 ^a 500-lb bales	Bales ^b ginned Dec 13, 1935
United States	9,636,559	10,734,000	9,757,680
Alabama	952,245	320,000	1,025,827
Arizona	116,363	125,000	102,083
Arkansas	874,782	890,000	782,457
California	259,551	205,000	190,533
Florida	23,957	29,000	26,447
Georgia	971,425	1,060,000	1,036,560
Louisiana	484,668	555,000	539,841
Mississippi	1,142,706	1,260,000	1,219,954
Missouri	233,864	200,000	162,388
New Mexico	87,104	78,000	56,737
North Carolina	631,420	585,000	555,176
Oklahoma	317,387	535,000	436,346
South Carolina	681,791	745,000	720,536
Tennessee	404,316	320,000	300,805
Texas	2,407,979	3,050,000	2,570,898
Virginia	32,961	30,000	24,787
All others	14,040	7,000	6,305

^a Estimated ^b Running bales.

The table includes for 1935, under the ginning report, 238,547 round bales counted as half bales and also 13,557 bales of American-Egyptian cotton, practically all grown in Arizona. The 1935 crop of Arizona was estimated to include 17,000 bales of American-Egyptian cotton grown on 38,000 acres. The crop of Lower California, Mexico, usually marketed through California, was estimated at 70,000 bales, not included in the totals.

The oil mills in the United States, during the cotton year ended July 31, 1935, crushed 3,549,891 tons of cottonseed. The products of the seed included 805,083 bales of lint, 913,039 tons of hulls, 1,614,345 tons of cake and meal, and 1,108,582,294 pounds of oil.

Exports of cotton and lint for the year ended July 31, 1935, amounted to 4,798,539 running bales of cotton and 205,246 bales of lint or a total of 5,003,785 bales. The principal exports of cotton (in bales) were to Germany, 341,580; United Kingdom, 738,154; France, 372,656; Italy, 474,106; Spain, 240,235; Belgium, 97,194; other European countries, 601,754; Japan, 1,524,395; China, 108,-

083; and Canada, 225,499. During the same period, the United States imported from Egypt 71,176 bales; British India, 24,903; China, 3185; Peru, 1192; Mexico, 5137; and from other countries, 1438. Exports for the five months ending Dec. 31, 1935, totaled 3,452,266 bales.

The consumption of all cottons in the United States decreased 339,386 bales in 1934-35 or to 5,360,867 bales compared with 5,700,253 bales in 1933-34. The cotton used by American mills was consumed largely, 80.3 per cent, in the cotton-growing States. Of 29,253,444 spindles in place Dec. 31, 1935, 23,391,370 were active during December, of which 17,209,878 were located in Cotton States, 5,525,516 in New England, and 655,976 in other States. The number of active spindle hours averaged in Cotton States 272, in New England 157, and elsewhere 148.

The world's consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1935, according to the U.S. Bureau of the Census, was about 25,283,000 bales. Estimates based largely on running-bale reports of the International Federation of Master Cotton Spinners' and Manufacturers' Associations were equivalent to slightly more than 23,700,000 bales (478 pounds), slightly larger than the estimated mill consumption of all cotton the previous season, the largest since 1928-29, and somewhat above the average for the 10 years ended 1932-33. Of the total consumption in 1934-35, almost 12,350,000 bales, or 52 per cent, was foreign cotton, and 11,350,000 bales, American. In 1933-34, out of a similar total, a little more than 13,500,000, or 57 per cent was American and 10,100,000 bales, or 43 per cent, was foreign. During the 10 years ended 1932-33, world mill consumption of American exceeded that of foreign growths by about 4,250,000 bales annually. Consumption of American cotton in 1934-35 was, with the exception of 1930-31, the smallest for 11 years, while mill consumption of foreign cotton was the largest in history.

Most of the decline occurring in consumption of American cotton from 1933-34 to 1934-35 was accounted for by the decline in consumption in foreign countries since domestic consumption declined only 300,000 bales. Factors contributing to the decrease in consumption of American cotton in 1934-35 relative to 1933-34 and relative to consumption of foreign cotton in 1934-35 included the relatively high prices of American cotton due in part to reduced supplies of American cotton resulting from the adjustment programme and the drought and to increased supplies of foreign cottons and in part to the 12-cent loan which in effect further reduced the available market supplies of American cotton; difficulties experienced by Germany, Italy, and Poland in obtaining foreign exchange with which to buy American cotton along with special trade arrangements with other cotton-producing countries; and the further shift in cotton processing from Europe to the Orient and the accompanying tendency for foreign-produced cotton to replace American cotton. The consumption (in bales) of the different growths included American cotton, 11,350,000; Indian cotton, 4,650,000; Egyptian cotton, 1,800,000; and sundries cotton, 5,950,000. The total consumption of all cotton in Europe in 1934-35 was reported at slightly less than 9,000,000 bales, compared with almost 9,500,000 bales during the previous season, in Japan 3,350,000, in China nearly 2,500,000, and in India about 2,400,000 bales.

The average price of middling $\frac{7}{8}$ -inch cotton at the 10 spot markets averaged 12.36 cents per pound

during the year ended July 31, 1935, compared with 10.81 in 1933-34, 7.15 in 1932-33, 5.89 in 1931-32, and 15.79 cents in 1929-30. Prices averaged 12.55 cents in January, 1935, 12.47 in February, and 11.57 in March. They averaged in April 11.80 cents; May, 12.33; June, 11.97; July, 12.22; August, 11.37; September, 10.48; October, 10.96; November, 11.98; and closed on December 31 at a range of 11.34 to 11.95 cents in the southern spot markets and at 12.10 in New York. The average prices received by producers at local farm markets on Dec. 15, 1935, were estimated at 11.1 cents per pound for lint and \$31.60 per ton for cottonseed compared with 12.36 cents and \$34.79, respectively, on Dec. 15, 1934. The farm value of the 10,734,000 bales of lint was estimated at \$593,677,000 and of the 4,775,000 tons of cottonseed at \$150,877,000 or a total of \$744,554,000 for the 1935-36 crop.

During the 1934-35 season a 12-cent loan on cotton low middling $\frac{7}{8}$ -inch and better was available to growers. During the latter part of August, 1935, a plan was announced which provided that the Commodity Credit Corporation would make loans on the 1935 crop at 10 cents per pound, basis $\frac{7}{8}$ -inch low middling or better, to cotton producers participating in the cotton adjustment programme in 1935 and who would agree to participate in the 1936 programme. Cooperating farmers were to receive price adjustment payments from the Agricultural Adjustment Administration equal to this difference between 12 cents and the average price of middling $\frac{7}{8}$ -inch cotton in the 10 designated markets on the date their cotton was sold. The payment of the difference was limited to their allotments under the Bankhead Act. The farm value of lint plus price-adjustment payments in 1935-36 was expected to materially exceed those of 1934-35. Estimates were that about 90 per cent of the 1935 crop would be produced by cooperating producers and that the total rental and parity payments to producers, under their 1935 cotton-adjustment contracts, would amount to about \$125,000,000, considerably larger than the \$116,000,000 paid cooperating producers in 1934, and equivalent to about 2.4 cents per pound on the estimated production of the cooperating farmers.

Cotton of the 1935 crop ginned up to Dec. 1, 1935, was lower in grade and averaged about the same in staple length compared to that ginned up to Dec. 1, 1934, according to a report based on the 9,359,389 bales of American upland cotton reported by the Census Bureau as ginned prior to that date, which represented 87 per cent of the estimated 1935 crop. Estimates were that 30.4 per cent was white and extra white strict middling or better, 31.8 per cent middling, about 20 per cent white and extra white strict low middling and below, and about 17.7 per cent spotted cotton compared with 11.9 per cent last season. Although staple length averaged the same in 1934 and 1935, the proportions of cotton $\frac{7}{8}$ -in. and shorter, and $1\frac{1}{16}$ -in. and longer decreased while the proportion of $1\frac{1}{16}$ to $1\frac{1}{2}$ -in. cotton increased in 1935. About 84.8 per cent of the cotton ginned up to Dec. 1, 1935, was tenderable versus 91.1 in 1934.

The U.S. Department of Agriculture, particularly the Bureau of Agricultural Economics, issued multigraphed publications on various phases of the cotton industry dealing with a preliminary statement of a cotton research programme; the world cotton situation—foreign cotton production; cotton production in southern Brazil; international trade in cotton in 1934-35; consumption of American and other growths of cotton in Japan; quality of cotton linters produced in the United States, season 1933-34; development of standards for grades of cottonseed; the problem of character standardization in American raw cotton; use of the official cotton standards of the United States (in sales to domestic mills); proposed revisions of the universal standards for grades of American upland cotton; baggings used for covering American cotton bales; bibliographies on the economic development of the cotton textile industry in the United States, 1910-35; and financing American cotton production and marketing in the United States. The Agricultural Adjustment Administration also issued a number of circulars concerned with the cotton adjustment programmes.

COUNTY CONSOLIDATION. See MUNICIPAL GOVERNMENT.

COURT GAMES. As usual, the most popular game, from the point of view of participants, was squash racquets, and in this sport an influx of younger players was noticed. New courts were built in New York, Philadelphia, Boston, and Chicago and the game was adopted by colleges and universities throughout the country in a manner never anticipated.

Donald Strachan, of Philadelphia, formerly a fine lawn tennis player, took the national cham-

pionship in 1935, whipping the defending champion, Neil J. Sullivan also of Philadelphia, in the final. Strachan lost only two games in the tournament. Philadelphia held a virtual monopoly in the winning of important championships. Philadelphia downed Boston in the final round of the national team title event, and it was Stanley W. Pearson, six times former holder of the national singles crown, who won the national veterans' honors. Neil Sullivan and Roy R. Coffin, another Philadelphian, retained their national doubles championship for the third successive year, and four Philadelphia teams made up the semi-final bracket in that tourney. Philadelphia also won the Lockett Trophy intercity matches, downing Boston and New York on successive days. And to round out Philadelphia's impressive record, Sullivan won the Gold Racquet tournament at the Rockaway Hunting Club, downing E. Rotan Sargent, of Harvard University, in the final. Strachan defeated Sullivan for the Atlantic Coast title. The United States won the Lapham Trophy from Canada, defeating the Canadians in Montreal, and Germaine Glidden took the intercollegiate laurels. The United States women surprised by conquering England for the Wolfe-Noel Cup.

Harry F. Wolf, New York Athletic Club player, remained head man in squash tennis for the sixth successive campaign, downing Rowland B. Haines in the final for the championship. Thomas Iannicelli, of Newark, took the world's open crown, abandoned by Frank Ward, who was ill and unable to defend the title held from 1926 through 1934.

Huntingdon D. Sheldon, of New York, regained the national amateur racquets championship defeating Edward M. Edwards, of Philadelphia, 1934 winner, in the final. Sheldon, paired with Joseph W. Brooks, was shorn of his national doubles laurels, bowing to the new champions, Leonard and Malcolm Kirkbride.

Ogden Phipps, youthful New Yorker, remained supreme in court tennis, the most ancient of all the court games, retaining his national singles honors by defeating James Van Alen, and retaining the national doubles crown, teamed with William Rand. New York's forces, led by Phipps, won in the annual intercity competition at the late Harry Payne Whitney's court in December.

Badminton, gentler in some respects than the other games and much more adaptable to home play, leaped into the limelight and the tournaments and exhibitions staged throughout the country were crowded with players and spectators. Jack Purcell, Toronto player, retained his world's professional championship.

COWEN, SIR FREDERICK HYMEN. A British composer, died in London, Oct. 6, 1935. He was born at Kingston, Jamaica, W. I., Jan. 29, 1852, and when four years old was brought to London by his father. His first music lessons were obtained from Henry Russell, and later he studied under Sir Julius Benedict and Sir John Goss. In 1863, he gave a morning concert at Her Majesty's Theatre. The following year he played at Dudley House (his father was secretary to the Earl of Dudley) and in 1865, his composition, a trio in A, was played there by Joachim, Pezze, and himself. He competed successfully for the Mendelssohn Scholarship in that year, but his parents refused to allow him to accept it. He then went to Leipzig to study under Hauptmann, Moscheles, Reinecke, and Plaidy. The Austro-Prussian War caused him to return home and he conducted his composition, an

overture in D minor, at Mellon's Promenade Concerts at Covent Garden. In October, 1867, he returned to Germany and entered the Stern Conservatorium at Berlin, where he studied under Kiel. He arrived in London a year later and appeared at various concerts, such as the Philharmonic, and the Monday Popular. On Dec. 9, 1869, he made his real début as a composer at St. James's Hall, where his symphony in C minor and piano-forte concerto in A minor were given.

Cowen then turned to conducting, and from 1871 to 1877 accompanied Her Majesty's Opera, and in 1880 became conductor of the Covent Garden Promenade Concerts. He led the Philharmonic Concerts from 1888 to 1892, succeeding Sir Arthur Sullivan, and in 1888 was invited to be the conductor at the Melbourne Centennial Exhibition, for which he received the unprecedented sum of £5000. He became conductor of the Hallé Orchestra, Manchester; the Liverpool Philharmonic, and the Bradford Choral Society in 1896, and in 1900 was reelected conductor of the Philharmonic Society as well as of the Scottish Orchestra. He was the conductor for the Handel Festival at Crystal Palace in the years 1903, 1906, 1909, 1912, 1920, and 1923; and for the Cardiff festivals of 1902, 1904, 1907, and 1910.

He received the honorary degree of Doctor of Music from Cambridge in 1900 and from the University of Edinburgh in 1910. The following year he was knighted. Sir Frederick's music was distinguished by a certain fantastic grace of its own, and as a result it was at its best when dealing with fairy tales, and the like. Throughout his operatic work, deeper emotions were handled skillfully, but it was in the lighter mood that he was most successful. In 1913, he wrote his memoirs, *My Art and My Friends*, and two years later published a humorous glossary, *Music As She Is Wrote*.

His many compositions included: the operas *Pauline* (1876), *Thorgrim* (1890), and *Harold* (1895), the oratorio (*Ruth* 1887); a number of cantatas, including *Rose Maiden* (1870), *The Corsair* (1876), and *John Gilpin* (1904); four suites, *Language of the Flowers* (1880), *In Fairyland* (1896), *English Dances* (1904), and *Language of the Flowers* (1914); the ballet, *Cupid's Conspiracy* (1916), *Monica's Blue Boy* (1917), and *Twelve Songs for My Little Ones* (1927), and over 300 songs, duets, piano pieces, etc.

CRETE, krēt. A geographical division of Greece. Area, 3199 sq. miles; population (1928), 386,427. Chief towns: Khania (Canea), the capital, 26,604 inhabitants; Ērackleion (Candia), 33,404. See GREECE under History.

CRICKET. The 1935 cricket season in the United States was enlivened by the visit of the team representing the Bermuda Athletic Association, which toured Eastern Canada, New York, and Providence, playing 19 games, of which the tourists won 11, lost 4, and drew 4. Their captain, W. F. Hayward, headed both the batted and bowling averages and scored a century in the match against the Crescent Athletic Club.

Defeating the eleven of the New York and Metropolitan District Cricket Association in the final, the Philadelphia C. A. won the Dewar Cup competition, revived after three years.

CRIME. As the year 1935 drew to a close, the Columbia Broadcasting System took a poll of 128 editors of leading newspapers and press associations seeking to discover the principal news-stories of the year. It is interesting to note that third on

the list was a "crime story," the trial and conviction of Bruno Richard Hauptmann, the two events exceeding it in interest being the Supreme Court decisions on New Deal legislation and the Italo-Ethiopian war, and that conspicuous runners-up were also crime stories like the kidnaping of George Weyerhaeuser at Tacoma, Wash., and the killing of Arthur (Dutch Schultz) Flegenheimer. Crime continued, therefore, to be a major industry in the United States and studies of it and proposed measures for controlling it were constantly in the news. See LAW; MEDICAL JURISPRUDENCE.

Causes for Crime in New York City. Two potent causes for the rise of criminality were isolated in New York City studies, the increase in the number of jobless boys, and the existence of slums. Police Commissioner Valentine disclosed that 15 per cent of the major crimes during 1934 were committed by young unemployed boys never before arrested. This factor came into prominence at a time when there was a decline in the serious crimes against the person—murder and manslaughter—and a rise in crimes against property—robberies and burglaries. The facts as to the slums were released by Langdon W. Post, Tenement House Commissioner, and referred specifically to the Borough of Manhattan where the contrasts in living conditions are particularly marked. According to the study cited, the ratio of arrests to 1000 population in the several age groups was as follows:

Age	Slum	Non-slum
Under 16	11 36	6 43
16 to 20	42.22	30 28
21 to 25	71.13	49 43
26 to 35	69 66	44 01
Over 36	33 89	20.41

Mr. Post pointed out "that these figures are based on places of residence of the offenders. They may venture afield to commit crime. They may invade Wall Street or Park Avenue, wherever they consider it opportune to challenge the law, but their home life is slumdom . . ." In short, both of these official statements emphasize the economic basis of crime, whether it be against the person or property.

Age of Criminals. An interesting supplement to these two fundamental studies was furnished by the Division of Investigation of the Department of Justice, of which J. Edgar Hoover is head. According to a report released by this agency on Dec. 10, 1935, "Of the persons arrested during the first nine months of 1935, whose records were submitted to the F.B.I., a total of 37.4 per cent were under 25 years of age. Arrests of 19-year-old individuals occurred more frequently than arrests for any other single age group. The serious charges most frequently placed against persons under 25 years of age were larceny, burglary, auto theft, robbery and assault. . . ." (It is interesting to note that these figures, compiled on a national scale, confirm the conclusions of the New York City studies.) A study covering 1388 cities revealed the following offenses:

Murder and non-negligent manslaughter	2,506
Manslaughter by negligence	2,006
Rape	3,176
Robbery	28,067
Aggravated assault	20,142
Burglary	132,487
Larceny	271,541
Auto theft	90,030
Total	549,955

Of the total, 103,462 had records on file with the U.S. Dept. of Justice, indicating the presence of a considerable number of recidivists. About 7 per cent were women. The rate of crime increased with the size of the city; and crimes of violence against persons were commonest in the summer months.

In connection with the work of crime detection, the F.B.I. revealed that on Dec. 1, 1935, it had 6,599,364 index cards on file, most of them covering known criminals or suspects. The total number of personal identification finger print cards on file through voluntary action of citizens had arisen, by the end of November, to 66,180.

Need for New Federal Judges. Naturally with the multiplication of crimes and greater skill in the detection and apprehension of those who commit them, the work of the courts has increased. This situation is reflected in the recommendation of the Conference of Federal Circuit Judges that eight additional district judgeships be created to clear the dockets of accumulated suits. It was revealed that criminal cases pending in United States courts increased from 9478 in 1934 to 11,469 in 1935, and that there was a decline in but one category, private suits, from 36,051 to 27,345. U.S. civil cases increased from 17,303 to 19,257; while bankruptcy cases increased from 63,352 to 65,347. Commenting on this situation Chief Justice Hughes said, on Oct. 7, 1935:

In 16 districts the average interval between joinder of issue and trial is reported as not exceeding six months. In only 15 districts is there a delay of over six months.

The delays as to actions at law and suits in equity have considerably increased since July 1, 1934. These have occurred notwithstanding the most earnest efforts of the district judges to keep up with their work . . .

It was particularly recommended that new judgeships be created in the Southern District of New York, and also in Northern Georgia, Louisiana, Kansas, Oklahoma, Missouri, and West Virginia. Attorney General Homer P. Cummings renewed this request in his annual report to Congress for 1935.

Inadequacy of Local Jails. A further aspect of the situation was brought to the fore on Dec. 24, 1935, when Sanford Bates, director of the Federal Prison Bureau, announced that intensive studies had led to the conclusion that 44 per cent of the local "lock-ups" were to be "condemned" in the sense that they could not be used for housing Federal prisoners. In explaining this harsh verdict, Mr. Bates said that the poor condition of many local jails was attributable to the "fee system" under which a sheriff or jail-keeper receives a fixed rate for each prisoner, regardless of what he spends in boarding and housing the inmate.

"Obviously," Mr. Bates remarked, "a system that starves the prisoner to pay the jailer is an evil." He therefore offered two suggestions for improving conditions: (1) A more efficient system of identification which would make it unnecessary to keep a man without a record in jail while awaiting trial; and (2) the development of State prison farms to replace local jails for prisoners serving sentences. "Under present deplorable conditions," Mr. Bates asserted, "the local jail is often a sort of third degree place for the innocent, where a decent man would be tempted to confess a crime whether he committed it or not, in order to get out of the local jail and into a State institution."

The Problem of Prison Labor. The vexed and ancient problems of prison labor moved toward a solution when, on Sept. 26, 1935, President Roosevelt, by executive order created the Prison Industries Reorganization Administration, com-

posed of Judge Joseph N. Ullman, chairman, Louis N. Robinson, L. N. Collins, Gustav Peck, and James P. Davis. The Administration was allocated \$100,000 and charged with the duty of working out a practicable programme for controlling prison labor and prison-made goods in co-operation with the several States and the District of Columbia.

The Crime Debate. In spite of the fundamental flaws in the social system which lead to the creation of slums and the multiplication of the idle young; in spite, moreover, of the horrifying condition of local jails, the crowding of the courts, and the existence of numerous unsolved penological problems like prison labor, efforts to solve the problem merely by increasing the power of the police to deal arbitrarily with crime go on. As yet no comprehensive programme of crime prevention has emerged from the enormous volume of discussion. Most of the proposals remain on the level of crime detection and punishment.

This is clearly brought out by the fact that the Interstate Commission on Crime devoted its efforts during the year to the formulation of a system of extradition which would make the apprehension of criminals who have crossed State lines after a crime, or who have directed crime from another State, as easy as possible; to the forwarding of the proposal that every one obtaining an automobile license be fingerprinted; and to the formulation of more flexible parole laws with the object of allowing persons on parole to seek employment outside the State, provided the new State of residence will take over the task of supervision. The continuance of this general approach was also evidenced at the crime conference held under the direction of Governor Lehman of New York State which announced that its studies led to such conclusions as the following: (a) the maladjusted child is the future delinquent; (b) the moral and ethical aspects of child training are being neglected; and (c) that something must be done about crime prevention. Nothing concrete emerged, unless the upshot of this conference at which a million words are alleged to have been spoken, is to be discovered in the Governor's message to the State legislature when it convened on Jan. 1, 1936:

From September 30 to October 3 of last year, 900 experts in the various fields of law enforcement convened in Albany, at my invitation, to discuss concrete suggestions for the strengthening and improvement of our machinery of law enforcement. The members of your Honorable Bodies were all invited to that conference, and many of you did attend. The entire proceedings of the conference were later published and made available to those who attended and to hundreds of others who requested copies.

May I add that many have written or told me that the conference was the best they had ever attended and that its deliberations have stimulated in the people throughout the State and nation a deep interest and a strong determination to curb vicious criminals and stamp out their highly organized rackets and devastating activities.

Immediately after the conference, I appointed a committee to assist me in the preparation of a broad programme of legislative and administrative changes, necessary and vital to a vigorous attack upon the criminal element in our society. This committee, under the chairmanship of Charles Polett, counsel to the Governor, has been giving itself most generously to this task. The committee has not yet completed its studies, although it has already submitted to me a number of reports. Later on during the session, I will transmit to your Honorable Bodies my programme on the improvement of the administration of criminal justice.

Equally in line with current approaches to this vexed subject was the announcement made in December that the New York City Police Department, in Co-operation with the WPA and the NYA (both temporary Federal bodies ostensibly concerned with public relief), was about to establish a

series of juvenile community centres to combat juvenile delinquency by teaching methods of healthfully utilizing leisure time. This move, no doubt inspired by the report on the increase of young criminals cited earlier and by the statement of the directors of the Florence Crittenton Missions for Delinquent Girls, that since the depression school teachers, trained nurses, and college students have been turning to them for aid in increasing numbers when the birth of an illegitimate child was imminent, promises to lead to the temporary establishment of centres throughout the city, especially in congested slum areas.

Racketeering. During the year the public attention was chiefly captured by two types of crime, racketeering and kidnaping. With the decline of legitimate business, and especially with the repeal of prohibition, it is alleged that the racketeers have been increasingly tempted to enter other lines, following various methods, but being principally devoted to the monopolization of foodstuffs and to the small-loan and "protection" rackets. While such activities are carried on in various parts of the nation, attention during 1935 was riveted on New York City where, under the direction of Deputy District Attorney Thomas E. Dewey, an investigation of the rackets was undertaken. Mr. Dewey found his task especially difficult because of the reluctance of business men who had been victimized by racketeers to testify for fear of reprisals. He was forced to resort to the tactic of sending a recalcitrant witness to jail for contempt of court. It was announced that a new grand jury to continue the racket inquiry would be impaneled on Jan. 24, 1936.

Kidnaping. A typical cycle of alarm was that precipitated by the Lindbergh kidnaping case of 1932 which came to a climax with the trial and conviction of Bruno Richard Hauptmann in early 1935. Extradited from New York, where he was captured in the Bronx after remarkable and successful efforts in tracking down the elusive criminal, he was indicted and tried in New Jersey to the accompaniment of one of the most amazing and ghastly exhibitions of newspaper and publicity irresponsibility ever perpetrated. Not only did American papers generally engage in the orgy but European papers spent thousands of dollars on cable dispatches and special feature writers arrived to cover the case from places as far away as Sydney, Australia. On Feb. 13, 1935, Hauptmann was found guilty of murder and sentenced to die in the electric chair on March 13. However, he turned to the Court of Error and Appeals by which his appeal was rejected, and then, late in the year, to the Court of Pardons, but no action had been taken as the year ended. Meanwhile, on December 16 he was informed that a new date for his execution had been set for the week of Jan. 13, 1936, and the prison warden started to make his arrangements to carry out the sentence.

On Dec. 23, 1935, the nation and the world was thrown into a fever of excitement by the appearance of an exclusive story in the *New York Times* stating that Colonel Lindbergh, his wife, and his surviving son, Jon, had left the United States secretly with the object of seeking refuge in England. The story asserted that "Threats of kidnaping and even of death to the little lad (Jon), recurring repeatedly since his birth, caused the father and mother to make the decision. These threats have increased both in number and virulence recently." It was recalled that Colonel Lindbergh had been the "victim" of a publicity campaign ever since

his spectacular flight over the Atlantic Ocean to France in 1928 and that the curiosity about him, legitimate and illegitimate, had increased in volume after his marriage to Miss Anne Morrow in 1929.

The publicity inevitably brought thousands of letters, many of them containing threats, most of which were traced by the police authorities and their authors arrested or incarcerated in asylums. The threats, over the years, showed peaks of frequency when Charles Lindbergh, Jr., was kidnaped, when Jon Lindbergh was born in 1932, and with the conviction of Bruno Hauptmann. After the birth of the second child, the threats were chiefly against his life. The final upsurge of such communications came when the case of Hauptmann was once more brought to public notice by the doubts cast upon the correctness of the verdict sentencing him to death. But the final incident which determined the Lindberghs to seek refuge abroad was described by the *Times* as follows:

Not long ago, as Jon was being taken by automobile from his school to his home, a large car containing several men came close alongside and crowded the car containing the lad to the curb, forcing it to stop.

Men jumped down. A teacher accompanying the little lad clutched him tightly. Suddenly cameras were thrust into the child's face and clicked. Then the visitors jumped into their machine and sped away, leaving a badly frightened teacher and little boy.

Since then Jon has not been to school.

The press reaction to this move on the part of the Lindberghs can only be described in Dr. Barnes' terms as a "cycle of alarm" for the episode was taken as a comprehensive indictment of the inadequacy of American police methods, a warning as to the height to which the tide of crime had arisen, and a rebuke to the American people for tolerating the inefficiency of the one and the menace of the other. Only a few public officials dared brave the popular reaction and assert that Lindbergh's course was excessive in the light of the facts.

Other kidnaping news of the year included the solving of the kidnaping of nine-year-old George Philip Weyerhaeuser by the government operatives working under the direction of J. Edgar Hoover. Two of the three persons allegedly participating in this episode were captured and sentenced for long terms in prison, much of the money paid in ransom was recovered, but a third participant, believed to be a known criminal named William Mahan, and the "brains" of the crime, remained at large. The kidnaper of C. F. Urschel, an Oklahoma oil man, was sentenced to 10 years in jail. But as the year closed, two kidnapers, in addition to Mahan, still evaded capture—Alvin Karpis who was involved in a case in Minneapolis, and Thomas H. Robinson, Jr., involved in a case in Louisville, Ky.

The most spectacular "gang-killing" of the year was probably that of Dutch Schultz. This episode has never been fully explained, but a reasonable story was told in *The Nation* for November 20, by Emanuel H. Lavine. According to Mr. Lavine, Schultz was "drilled" because he attempted to cut in on the small loan racket in Brooklyn . . . one of the rackets to which District Attorney Dewey gave attention.

CRIMINAL LAW. See **LAW**.

CROSS-COUNTRY RUNNING. College cross-country runners of the Middle West maintained their hold on the two important hill and dale fixtures of 1935, while the East continued its domination of the long distance field.

Donald Lash, junior at the University of Indiana, retained his position as the foremost harrier of the country, again romping in ahead in the national championship cross country run, decisively out-running his field through snow and biting winds at Van Cortlandt Park, New York. The National team championship went to the Millrose A.A., but that was a hollow victory, because the first three men to finish were U. of Indiana runners and the fourth was also a Hoosier. The mid-Westerners didn't have a full team of five at Van Cortlandt Park, however, and weren't eligible for the team crown. The Intercollegiate A.A.A.A. championship went to J. Edward Bechtold of Michigan State, a middle Westerner by training but a New Yorker by birth. Michigan State captured the team title for the third successive year and in most decisive fashion.

In the long-distance field, the national 10,000 meter run was taken by Tom Ottey, former Intercollegiate cross country ruler and the 3000 meter steeplechase went to Joe McCluskey for the fifth time in six starts.

CRUSTACEA. See ZOOLOGY.

CUBA. An island republic of the West Indies. Capital, Havana (Habana).

Area and Population. Cuba has an area of 44,164 square miles, including the Isle of Pines (1180 sq. miles) and other small islands (1350 sq. miles). The estimated population as of Dec. 31, 1932, was 4,075,000 (3,962,344 at the 1931 census). The chief cities, with their estimated 1933 populations, are: Havana, 543,000; Camaguey, 131,583; Santiago de Cuba, 103,497; Santa Clara, 97,181; Cienfuegos, 87,970; Sancti Spiritus, 86,495; Guantánamo, 66,059; Pinar del Río, 63,213; Manzanillo, 63,211; Trinidad, 62,370. Whites comprise about 68 per cent of the population, the remainder being chiefly Negroes and mulattoes. Births in 1933 numbered 66,922; deaths, 48,628; marriages, 10,760.

Education. Elementary education is nominally free and compulsory, but of 852,162 children of school age in 1932 only 426,708 were enrolled in primary schools. Large numbers of pupils do not complete the primary school courses; in 1932, 64.5 per cent of the enrollment was in the first and second grades. The 364 private schools had 26,622 pupils. The secondary schools were in process of reorganization in 1935. Twenty-four high schools were being established to replace the six provincial institutes which formerly provided the only secondary training. The University of Havana, closed for political reasons in 1931, was reopened in 1933.

Production. Agriculture is the main support of the population and sugar is the chief crop, accounting for 68 per cent of the value of all exports in 1933. Production of the 1935 sugar crop was officially restricted to 2,315,000 long tons; actual production was 2,537,385 long tons, as compared with 2,274,303 tons in 1934. The recovery of the Cuban sugar industry from the devastating effects of the world economic depression commenced in 1934, when the United States reduced its tariff on Cuban sugar from \$2 per 100 lb. to \$0.90, and fixed its import quota on Cuban sugar at 1,902,000 short tons (raw value). The 1935 import quota was 1,857,022 short tons.

Exports of raw sugar in 1935 totaled 2,398,734 long tons, of which 1,609,964 tons went to the United States. In 1934 total exports were 2,344,947 long tons and shipments to the United States were 1,581,548 tons. The average price for 96° sugar in warehouse at Havana for export for 1935 was 1.58073 cents per lb., compared with 1.195409 cents in 1934. The estimated stock of raw sugar in Cuba at the close of 1935 was 652,004 long tons (808,339 on Dec. 31, 1934). The production quota for 1936 was fixed at 2,515,000 long tons.

The tobacco crop, ranking second in importance, totaled 45,619,695 lb. in 1934 (36,352,032 lb. in 1933); coffee, 31,400 metric tons in 1932-33. Shipments of fresh vegetables to the United States in 1934 totaled 58,901,841 lb.; of fruit, 23,718,000 lb. (exclusive of 705,907 crates of pineapples). Cacao, corn, cereals, and potatoes are other crops. Live-stock in 1933 included 4,316,862 cattle, 585,739 horses, 102,000 sheep, 591,000 swine, and 77,990 mules. The forests yield valuable cabinet and dye woods. The production of iron ore in 1933 was 169,000 metric tons; manganese (exports, 1933), 41,512 tons; copper ore (exports, 1933), 24,322 tons. Numerous small manufacturing industries have been developed with the aid of a protective tariff, the chief products being foodstuffs, clothing, footwear, paints, paper, textiles, furniture, and cement. Rum manufacture was stimulated by the repeal of prohibition in the United States.

Foreign Trade. After declining rapidly during the period 1929-33, Cuba's foreign trade expanded noticeably in 1934, as shown in the accompanying table. Trade with the United States is included

CUBAN IMPORTS AND EXPORTS

[In thousands of dollars]

Year	General imports	Imports from U. S.	Total exports	Exports to U. S.
1929 . .	\$216,215	\$127,051	\$272,440	\$208,774
1930 . .	162,452	91,872	167,411	116,051
1931 . .	80,112	45,940	118,866	89,074
1932 . .	51,024	27,653	80,672	57,482
1933 . .	42,362	22,674	84,391	57,112
1934 . .	73,388	41,225	107,746	81,094

Exports exceeded imports by \$34,358,000 in 1934 (\$42,029,000 in 1933). The other leading sources of supply, after the United States, in 1934 were: British India, \$4,580,427; Spain, \$4,051,252; United Kingdom, \$3,941,149; Japan, \$3,136,090 (\$857,004 in 1933); Germany, \$2,905,194. The United Kingdom purchased Cuban exports to the value of \$14,498,311; France, \$3,155,483; Spain, \$2,374,868. The value of sugar exports in 1934 was \$73,993,000 (\$53,972,000 in 1933) and the volume was 2,458,000 long tons of raw and refined sugar (2,408,000 in 1933). Tobacco exports totaled \$14,498,147 (\$13,395,306 in 1933).

United States statistics for 1935 showed imports from Cuba of \$104,638,523 (\$78,928,916 in 1934) and exports to Cuba of \$60,152,732 (\$45,323,374 in 1934).

Finance. Budget estimates for the fiscal year ended June 30, 1936, placed receipts at 62,250,000 pesos and expenditures at 65,125,199 pesos. The budget made provision for resumption of amortization payments on the so-called "Morgan and Speyer Loans," but no provision was made for servicing the Cuban Public Works securities. Revenues from taxes pledged to the latter obligations were to be credited to the general revenues, as in 1934-35. The principal expenditures items were: National Defense, 14,536,000 pesos; education, 11,089,000 pesos; public debt service, 7,095,000 pesos. The 1934-35 budget estimated ordinary

revenues at 56,200,000 pesos and expenditures at 55,395,000 pesos. Actual revenues were 64,702,000 pesos in 1934-35 and 45,750,000 pesos in 1933-34.

According to an official statement, the Cuban public debt as of Feb. 28, 1935, totaled 149,477,000 pesos, divided as follows: External, 50,399,000; internal, 7,717,000; public works debt, 80,867,000; sugar stabilization bonds, 10,494,000. Dollar bonds issued or guaranteed by the Cuban Government outstanding as of Dec. 31, 1934, amounted to \$91,878,100, of which \$40,000,000 were in default as to interest and \$51,878,100 were in default as to sinking fund. The peso (par value, \$1.6931) exchanged at approximately \$1 in 1932, 1933, and 1934.

Communications. Cuba in 1933 had 3043 miles of public service railways, besides some 5600 miles of private lines operated by sugar plantations. Transportation of the sugar crop normally provided about 80 per cent of the total operating revenues. The railways in 1935 were meeting serious competition from buses and trucks, especially those operating on the new Central Highway, running almost the length of the island from Pinar del Rio to Santiago de Cuba (706 miles). The highway network aggregated more than 2000 miles. Air lines connect the chief Cuban cities and extend from Havana to the United States, Mexico, and South America. Vessels entering and clearing the ports in the overseas trade in 1933 numbered 6209, of 32,603,429 gross tons.

Government. Following the deposition of President Machado on Aug. 12, 1933, the Constitutions of 1901 and 1928 were declared null and void. Successive provisional governments were formed by Dr. Carlos Manuel de Cespedes (Aug. 12, 1933), Dr. Ramon Grau San Martin (Sept. 5, 1933), and Col. Carlos Mendieta (Jan. 18, 1934). The Mendieta Government on Feb. 3, 1934, issued a temporary organic law, under which elections for a Constituent Assembly to draft a new Constitution were to be held in 1935 (see *History*). By the decree of June 12, 1935, the provisional Constitution of Feb. 3, 1934, was set aside and the 1901 Constitution was restored with certain modifications.

HISTORY

Internal Politics. By 1935 the Cuban revolution of 1933 seemed to have spent much of its force. The revolt was aimed not only at the discredited Machado dictatorship but also at the chronic political misrule which Machado symbolized. It demanded far-reaching reforms in the economic system fastened upon the island by American capital, which deprived Cubans of both economic independence and security and tended to degrade Cuban political and social life. However, the opportunity for thorough-going national reconstruction presented following the collapse of the Machado Government was wasted during 1934, due to innumerable divisions among the revolutionary forces and the inability of Cubans generally to cooperate in political and economic affairs. By the beginning of 1935 the masses of the people were apparently weary of violence and political strife, disillusioned, and desirous only of conserving the economic gains registered as a result of the world economic upswing and the reciprocity treaty concluded in 1934 with the United States. The island appeared to be headed for a permanent military dictatorship under Col. Fulgencio Batista, the former army sergeant who emerged from the revolutionary welter of 1933 as commander-in-chief of the army, or for a return

to the corrupt pre-revolutionary political system.

The elections for a Constituent Assembly, originally set for December, 1934, had been postponed until March, 1935, because of continued unrest and disorder. Aroused by sabotage in the cane fields, which threatened to nip Cuba's returning prosperity in the bud, the Mendieta Government on Jan. 15, 1935, suspended constitutional guarantees and took drastic measures to punish incendiaries and others. President Mendieta also continued his fruitless efforts to unite the various warring political factions on a common programme, even offering to resign if they could agree upon his successor. The so-called *Auténticos*, headed by ex-President Grau San Martin, the formerly powerful, semi-Fascist ABC group, and several others whose leaders had gone into exile during 1934, refused to cooperate on any other basis than the immediate resignation of both the President and Colonel Batista. At the same time the *Auténticos* and ABC adherents were in open warfare with one another.

The President's effort to conciliate the students of Havana University proved equally useless. In February, in response to the student agitation, Mendieta granted practically all their demands, including larger appropriations and the autonomous control of university affairs. After ousting many professors accused of siding with the hated Machado régime, and turning the curriculum and administrative system upside down, the students began to convert the university into an armed base for the violent overthrow of the Mendieta Government. On February 12 they organized a strike, accompanied by bombing and other forms of violence, for the restoration of constitutional rights, more adequate financial support of education, and the curbing of the army's power. The strike soon spread to the secondary and grade schools, closing every educational institution on the island. It then became openly political, demanding the immediate resignations of the President and Colonel Batista. As such it was joined by all the Opposition groups, including the *Auténticos*, the ABC, radical labor unions, Communists, and even by most of the employees of the government departments. By March 11 it was estimated that more than 400,000 students and workers were on strike and the economic life of the island was practically paralyzed.

Although many of his cabinet members resigned, President Mendieta, with Colonel Batista's support, met the emergency with firmness. The university and the secondary schools were closed and placed under military control. A state of siege, declared on March 9, permitted the extension of military rule over all six provinces, and this was followed two days later by the declaration of a "state of war." President Mendieta declared on March 11 that the revolutionary general strike was aimed at the foundations of the Republic and that he could not yield to it. He repeated his promise to hold fair elections as soon as possible. After days of tense struggle the largely passive resistance of the strikers was crushed by Batista's troops, but not until a dozen persons had been killed, scores injured, and some 800 arrested. Many other opponents of the government fled into exile.

For several months Cuba remained under a rigid military dictatorship. All Opposition newspapers were suspended, the labor unions which took part in the strike were dissolved, the autonomy of the University of Havana was withdrawn, and on April 9 even the high schools were closed for the remainder of the term. Military governors

ruled the provinces and military supervisors were placed over each district. The government services and the schools were purged of Oppositionists, and their places filled in many cases with relatives and friends of the army. On May 8 Batista's troops eliminated their chief's most dangerous enemy, when Dr. Antonio Guiteras, a former radical member of Grau San Martín's cabinet and leader of the Young Cuba Party, was killed in a minor battle near Matanzas.

Once in full control of the situation, President Mendieta renewed his efforts to carry through the promised elections. On April 30 he reached an agreement with four of the old-line political parties for the holding of the elections on November 1; subsequently they were postponed to December 15. The agreement was accepted only by the President's own party (the Nationalists), the Democrats, the Republicans, and the remnants of Machado's old party (the Liberals). The new revolutionary parties—*Auténticos*, ABC, and Young Cuba—declined to participate in the elections and gave notice that they would not accept the outcome.

To pave the way for the elections, the government on June 12 proclaimed the old Constitution of 1901 as in effect, with certain modifications. The political campaign now got under way in earnest. Ex-President Machado's old Liberal party was the first in the field with a candidate, nominating Dr. Carlos Manuel de la Cruz. His prospects were weakened, however, by the opposition to his candidacy of a minority faction of Liberals. On October 12 the Democratic party nominated Mario G. Menocal, President of Cuba for two consecutive terms from 1913 to 1921. These moves hastened the coalition of President Mendieta's Nationalists with the Republicans headed by Dr. Miguel Mariano Gómez, and on October 20 Dr. Gómez was nominated as their joint candidate. Later the dissident faction of Liberals united with the Nationalist-Republican coalition in support of Dr. Gómez. The newly organized Centrist party nominated Dr. Carlos Manuel de Céspedes, who had served as Provisional President for a short time following the overthrow of President Machado in 1933.

On November 20 the Cuban Supreme Electoral Tribunal blasted the hopes of the coalition by ruling that the minority Liberals could not vote for Dr. Gómez but must support Dr. Carlos Manuel de la Cruz as the candidate of the majority of their party. The coalition vigorously protested the ruling. Threatening to withdraw from the election, they urged President Mendieta to annul the court's decision or to reform the electoral code. The Democrats and majority Liberals in turn threatened to boycott the election if this was done. Unable to break the deadlock among the parties President Mendieta on November 27 indefinitely postponed the December 15 election. He announced that Prof. Howard Lee McBain of Columbia University, who had proposed electoral reforms for Cuba in 1933, would be invited to draw up a new electoral code acceptable to all parties. This decision was acclaimed by the coalition but the Democrats and majority Liberals declared they would not accept postponement of the election beyond the end of December nor approve Dr. McBain's intervention in any rôle except that of adviser and conciliator among the parties.

Pres. Harold W. Dodds of Princeton University was then invited by the government to suggest a solution for the political tangle. His proposal that

the majority and minority Liberal electors should choose between Drs. Gómez and de la Cruz was accepted. On December 18 they voted to back Gómez, thus eliminating the candidacy of de la Cruz. Fearing that the Dodds ruling would strengthen Gómez, General Menocal had previously refused to continue in the race unless President Mendieta resigned. Accordingly the President submitted his resignation on December 11 and was succeeded by Secretary of State José A. Barnet y Vinageras on December 13. Thereafter preparations were made for holding the elections on Jan. 10, 1936.

Legislation, etc. While the Mendieta Government took the position that its main function was the holding of elections and the restoration of a constitutional régime, it nevertheless took some hesitant steps in the direction of social welfare legislation and the improvement of economic conditions. The decree of Apr. 12, 1935, established a Superior Labor Council to serve the Department of Labor in an advisory capacity. Another decree of May 7, 1935, established employment offices in five provincial capitals. Provisions of the latter law gave the government a powerful club to hold labor in line. It provided that every employer must inform the employment office in his province of all changes among his employees. Vacant positions were to be filled from lists of applicants provided by the employment office and no employer might hire an employee lacking a registration card from his district office. Labor unions were also obliged to report all cases of dismissal, employment, and reemployment affecting their members.

To keep the cost of living down, the government extended for six months beginning Oct. 2, 1935, the application of the minimum tariff on foodstuffs and other essential commodities imported from countries other than the United States. The civil-service law was restored. In an effort to force other countries to buy more from Cuba, a 25 per cent surcharge was laid on imports from countries with which Cuba's balance of trade was heavily unfavorable. The Cuban Institute for the Stabilization of Coffee was organized on Mar. 7, 1935, in accordance with a law signed by the President January 24. Its function was to promote the cultivation of coffee and to recommend legislation for that purpose.

Relations with the United States. The relations between the United States and Cuban governments remained extremely cordial during 1935, but in Opposition circles in Cuba there was much criticism of the active part which they declared United States Ambassador Caffery was playing in supporting the Mendieta régime. The favorable economic developments of the year in Cuba were clearly attributable in part to reduction of the United States tariff on sugar and other provisions of the 1934 trade treaty. Appreciation of the policy of economic cooperation followed by the United States was expressed by a delegation representing the Social-Economic Union of Cuba, which visited Washington in August. They presented President Roosevelt with a testimonial signed by 320,000 Cubans.

A self-appointed committee of American Communists and radicals arrived in Havana July 2, with the announced intention of conducting an inquiry into the repressive measures used by the Mendieta régime. The Cuban police shipped them home on the same boat, holding them incommunicado until the vessel sailed. Their demand for the dismissal of Ambassador Caffery was answered by President Roosevelt on August 2 by a state-

ment declaring the Ambassador to have the full confidence of the Washington Government. In August a committee representing American holders of Cuban Public Works' bonds issued by the Machado Government visited Havana in an effort to induce the Mendieta régime to resume payment of interest on these bonds. President Mendieta informed them that his government would leave this question to be decided by the constitutional government later to be constituted. The committee, consisting of Senators Gerald P. Nye and Burton K. Wheeler, Dr. Max Winkler, and Albert Coyle, declared that the least the Cuban Government could do under the circumstances was to place the special public works' taxes pledged as security for the bonds in a separate trust account.

Another important event in Cuban-American relations was the publication on Jan. 27, 1935, of the Report of the Commission on Cuban Affairs, entitled *Problems of the New Cuba*. The commission, consisting of 11 American experts organized by the Foreign Policy Association, made a survey of Cuba in 1934 at the request of President Mendieta, who desired the guidance of unbiased foreign experts in formulating solutions for Cuba's many pressing problems. The comprehensive report declared that complete social and economic reconstruction was the only alternative to chaos in Cuba, and suggested a detailed programme of agrarian reform, agricultural diversification, financial reorganization, etc. The ten principal recommendations were as follows:

A land policy under which the Cuban Government would acquire land for the purpose of developing small holdings, making compensation in internal bonds or cash.

The development of a programme of diversification by (a) establishment of agricultural colonies, (b) promotion of agricultural research and education, (c) creation of a marketing organization under government auspices, (d) adoption of a scientific tariff policy.

The development by the Cuban Government of a programme of agricultural education, public health nursing, medical research and social welfare.

A soil survey, initiated with the assistance of foreign surveyors, for the purpose of providing a scientific basis for diversified agriculture, forestry and dairying, and for the development of independently owned small farms.

The enactment of legislation requiring each sugar central to set aside land on which its workers may produce food, and to appoint a full-time sustenance manager to develop food production.

An international sugar agreement under which leading sugar-importing countries would agree to adopt the quota system of the United States and under which the life of the Jones-Costigan Act and the Chadbourne plan would be extended. The chief purpose of such an agreement would be to increase the world price of sugar.

The imposition of a tax on unused land for the purpose of encouraging the development of millions of acres of uncultivated areas in private hands, and also of a progressive export tax on sugar for the purpose of increasing revenue and imposing a brake on undue expansion of sugar following a marked price increase.

The establishment of an Agricultural Bank to encourage diversification and local cooperative associations.

The adoption of a dollar-exchange currency system, which would give Cuba a safe and equitable national currency and which might yield to the Cuban Government an initial profit of about \$15,000,000 and an annual revenue of a million dollars.

The establishment of a Public Utilities Commission, to have jurisdiction over light, power, telephones, railways, and highways.

Other Events. A hurricane of great intensity struck the south coast of Cuba on September 28 and cut a devastating path 150 miles wide through Santa Clara province. It took a toll of 50 lives and 450 persons were injured, most of them in the town of Cienfuegos. Great damage was done to sugar cane and other crops.

CUMBERLAND PRESBYTERIAN CHURCH. One of the Presbyterian bodies whose chief strength is in the Southern States. It was

formed in 1810 when the so-called anti-revival party of the Presbyterian Church in the United States of America objected to the admission into the ministry of men who were not up to the usual literary and theological standards, and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith.

A general assembly which meets annually is the supreme judiciary, the 1935 meeting being held in McKenzie, Tenn., June 13-18. In 1935 there were 1152 churches, reporting 785 ministers and a church membership of 71,059, in the denomination's 10 synods and 62 presbyteries. The Sunday school enrollment was approximately 55,000. The property of the church was valued at \$3,864,000, not including a \$500,000 endowment for education.

Missionary work is carried on among the Indians in the United States, in China, and South America. The denomination maintains Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. Its official organ is the *Cumberland Presbyterian*. The Rev. Davis of Memphis, Tenn., was moderator of the general assembly in 1935, and the Rev. D. W. Fooks of Nashville, Tenn., was stated clerk, treasurer, and general secretary.

CURAÇAO, koo'ra-sá'ô; kû'ra-sô'. A colony of the Netherlands, consisting of two groups of islands 500 miles apart: (1) Curaçao, Bonaire, Aruba, just north of Venezuela, (2) St. Martin (southern part), St. Eustatius, Saba, just west of the Virgin Islands. Total area, 403 sq. miles; population (Jan. 1, 1934), 79,395. Willemstad (capital) on Curaçao island, had 20,972 inhabitants.

Production and Trade. Maize, beans, pulse, salt, phosphate of lime, and cattle, were the main products. Oil refining was the principal industry. In 1933, imports were valued at 150,268,613 guilders; exports, 194,560,473 guilders.

Government. The budget for 1935 estimated revenue at 6,482,700 guilders; expenditure, 6,478,453 guilders. A governor administers the colony, aided by a privy council of four members and a colonial council of 13 members all nominated by the Queen. Governor in 1935, B. W. T. van Slobbe.

CURLING. For the first time in seven years, United States curlers early in 1935 carried off the coveted Gordon International Medal, leading trophy in the sport. Playing against the Canadian branch of the Royal Caledonian Society at Montreal, the United States players triumphed, 185 to 179. It was the eleventh time the United States had won the medal since it was put up in 1883 by Robert Gordon.

The Schenectady Curling Club retained the Gordon National Medal, with R. D. Thompson as skip, and the Utica Curling Club captured most of the other important fixtures, with the exception of the Stockton Cup, which was taken by the Brookline C. C. Utica captured the St. Andrews Medal, the R. L. S. Memorial, the W. Fred Allen Memorial, the Mitchell Medal, the Paterson Memorial, and the Munson Shield.

CURRENCY. See COINS, VALUE OF; FINANCIAL REVIEW; INTERNATIONAL BANKING; MONEY; UNITED STATES.

CUTTING, BRONSON (MURRAY). An American senator, died in an aeroplane accident near Atlanta, Mo., May 6, 1935. Born in Oakdale, L. I., June 23, 1888, he graduated from Harvard University in 1910. Owing to failing health, he went west and settled in the Territory of New Mexico. In 1912, with health restored, Mr. Cutting seeking an occupation engaged in politics as the Territory

was then about to be admitted to the Union. Politically, Cutting was attracted by the "Bull Moose" Party in 1912, and for two years was treasurer of the Progressive State Central Committee and chairman from 1914 to 1916. From 1915 to 1917 he was a member of the Executive Committee of the New Mexico Taxpayers' Association. He turned to journalism, also, in 1912, purchased *The New Mexican*, the oldest newspaper in the State, and began a drive against corrupt politics. In the same year he became president of the New Mexico Printing Co., which he served until 1918. In 1920 he was elected president of the Santa Fe-New Mexican Publishing Corporation.

During the World War, Mr. Cutting was a military attaché at the American embassy in London and for his services was awarded the British Military Cross. After the War he returned to politics, and brought out a Spanish edition of his newspaper entitled *El Nuevo Mexican*. In 1920 he was appointed regent of the New Mexico Military Institute and in 1925 was chairman of the Board of Commissioners of the New Mexico State Penitentiary.

Governor Richard Dillon appointed him Senator from New Mexico in December, 1927, to fill out the unexpired term of the late Sen. A. A. Jones. He was elected in November, 1928, for the full term ending in March, 1935, and had been reelected in November, 1934, although the election was contested by his opponent. Senator Cutting was considered one of the most liberal-minded in the Senate, and had served on such important committees as Banking, Foreign Relations, Irrigation, and Manufactures. He favored freedom for the Philippine Islands, leading the fight to pass the freedom bill over President Hoover's veto; the payment of the soldiers' bonus, and recognition of the Soviet Union. Although a Republican, he supported the election of Franklin D. Roosevelt in 1932.

Mr. Cutting was active in the American Legion, having been national executive committeeman from 1919 to 1920; departmental commander, 1923-24; department adjutant, 1925-27. Also, he was interested in the archaeology of the Southwest and was a member of the Archaeological Institute of America and the Southwestern Anthropological Society.

CYCLING. Two champions retained their crowns in 1935 cycling, a season in which eight new titleholders arose in the 10 standard divisions of the sport. Probably the most notable of all the bicycling performances was turned in by Joseph Scherens, sturdy Belgian rider, who won his fourth consecutive professional sprint championship of the world. The only other champion to repeat 1934 conquests was Willie Honeman of Newark, who won the professional sprint championship of the United States for the second successive year.

Charles Lacquehay of France, became again the world's champion among the motor-paced riders, replacing Eric Metze of Germany. Lacquehay was champion in 1933. Jean Aerts, Belgian, succeeded his compatriot, Karl Kaerze, as world's professional road champion. Tony Merkens of Germany became world's amateur sprint ruler, dethroning Benedetto Pola of Italy, and Ivo Mancini, Italian, won the amateur road honors of the world. Norman Hill replaced George Dempsey as national professional all-around champion and Franco Georgetti regained the national professional motor-paced crown. Albert Sellinger of Newark, N. J., won the national amateur sprint title. Gustav Kilian and Heniz Vopel, Germans, spread-eagled the

six-day field, winning at Montreal, Pittsburgh, Chicago, and New York in quick succession in their first appearance in the United States.

CYPRUS. A British crown colony. Area, 3584 sq. miles; population (1934), 361,350 compared with 347,959 (1931 census). Most of the people belonged to the Christian faith and 65,300 were Moslems. Chief towns: Nicosia (capital), 23,677 inhabitants in 1931; Limassol, 15,066; Larnaca, 11,725; Famagusta, 8771; Paphos, 4467; Morphou, 4335; Kyrenia, 2049.

Production and Trade. Wheat, barley, tobacco, grapes, carobs, olives, citrus fruits, cotton, and potatoes were the chief agricultural products. Sponge fishing was a minor industry. Pyrites, asbestos, chromite, copper, gypsum, and terra umbra were the main minerals produced. In 1934, imports were valued at £1,419,162; exports, £1,079,427.

Government. For 1934, revenue (exclusive of grants-in-aid) amounted to £763,672; expenditure (exclusive of expenditure from grants and the Cyprus share of the Turkish Debt charge), £710,912. Since the riots of November, 1931 (see *NEW INTERNATIONAL YEAR BOOK*, 1931) the power to make laws has rested with the Governor (in 1935, Sir H. R. Palmer).

History. Early in 1935 the Governor issued a proclamation directing that the English language was to be taught in all schools from Sept. 1, 1935.

CZECHOSLOVAKIA, čěsk'ô-slov'va'k'î-â. A central European republic, established Oct. 28, 1918. Capital, Praha (Prague).

Area and Population. The area and population of Czechoslovakia, by provinces, at the censuses of 1930 and 1935 are shown in the accompanying table. The 1935 figures are preliminary.

CZECHOSLOVAKIA· AREA AND POPULATION

Province	Area, sq miles	Population	
		1930	1935
Bohemia	20,102	7,109,376	7,220,000
Moravia and Silesia	10,334	3,565,010	3,623,000
Slovakia	18,882	3,329,793	3,471,000
Ruthenia	4,877	725,357	780,000
Total	54,195	14,729,536	15,095,000

During the five-year period 1930-35 the rate of increase of population was five times higher in Slovakia and Ruthenia than in the more highly developed western sections of the country. Live births for the entire country in 1934 numbered 283,757; deaths, 199,203; marriages, 118,270. The 1930 population included 9,688,943 Czechoslovaks, 3,231,718 Germans, 692,121 Hungarians, 549,043 Russians, 186,474 Jews, and 81,741 Poles. Census populations of the chief cities (1930) were: Praha (Prague), 848,823; Brno (Brunn), 264,925; Moravská Ostrava, 125,347; Bratislava (Pressburg), 123,884; Plzeň (Pilsen), 114,704. In 1930 there were 10,833,423 Roman Catholics, 1,109,229 Protestants, 854,638 professing no religion, 585,439 Greek and Armenian Catholics, 356,768 Jews, and 145,598 of the Orthodox faith.

Education. Elementary education is compulsory for children from 6 to 14 years of age and there is almost no illiteracy, except in Slovakia and Ruthenia. In October, 1933, there were 15,236 elementary public and private schools, with 1,853,076 pupils; 1911 advanced elementary schools, with 417,815 pupils; 354 secondary schools and teachers' training colleges, with 94,335 pupils; 666 technical schools, with 95,901 pupils; and 16 institu-

tions of university rank, with 32,831 students. The four principal universities (2 Czech, 1 German, and 1 Slovak) had 21,506 students in 1932-33; the four technical high schools, 10,373 students.

Production. Czechoslovakia is a rich agricultural, mining, and lumbering country and the northwestern section is one of the most highly developed industrial regions in Europe. About 40 per cent of the population is engaged in agriculture and forestry. Yields of the chief crops in 1934 were (in metric tons): Wheat, 1,361,200; rye, 1,523,300; barley, 1,034,400; oats, 1,179,000; corn, 247,100; potatoes, 7,764,600; sugar beets, 3,860,000; tobacco, 14,600; hops, 7000; flax, 5100. The 1934 wine production was 203,000 hectoliters (of 26.42 U. S. gal. each). Beet sugar output in 1934-35 was 557,000 metric tons. Livestock on Jan. 1, 1934, included 4,404,796 cattle, 700,658 horses, 3,429,919 swine, 475,881 sheep, and 929,631 goats.

The mineral and metallurgical production in 1934 was (in 1000 metric tons): Coal, 10,775; lignite, 15,261; coke, 1345; pig iron, 600; steel, 953; zinc, 7.5; salt, 157 (1933). Some manganese, copper, graphite, silver, and garnets also are produced. Industrial establishments in 1932 numbered 1335, with a share capital of 8,720,000,000 crowns. There were 284 concerns producing foodstuffs and beverages, 157 in the metal industry, 100 in textiles, 99 in stone and earthen wares, 85 in the chemical industry, 56 operating woodworking establishments, 28 in glass. The rayon production in 1934 was 2580 metric tons. Beer production (1934) was 7,996,000 hectoliters. There is an important shoe-manufacturing industry.

Foreign Trade. Imports in 1934, excluding bullion, were valued at 6,363,993,000 crowns, compared with 5,799,891,000 in 1933 and 19,988,000,000 in 1929. Exports amounted to 7,276,672,000 crowns (5,841,303,000 in 1933 and 20,499,000,000 in 1929). The leading imports, by value, were in 1934 (in 1000 crowns): Woolen goods, 686,908; cotton goods, 679,265; cereals, 244,423; mineral oils, 213,924; iron and steel, 201,862. The chief exports were (in 1000 crowns): Iron and steel, 875,576; cotton goods, 603,321; glass, 596,962; woolen goods, 569,509; coal, 449,117; leather and leather goods, 349,471. Germany was the chief source of imports, followed by France, the United Kingdom, and Austria. Exports went mainly to Germany, Austria, the United States, and the United Kingdom.

Imports in 1935 totaled 6,707,619,000 crowns and exports were 7,402,694,000 crowns. United States statistics for 1935 showed imports from Czechoslovakia of \$21,365,760 (\$17,552,264 in 1934) and exports to Czechoslovakia of \$3,244,457 (\$2,743,905 in 1934).

Finance. Provisional returns for the calendar year 1934 showed a combined deficit in the ordinary and extraordinary budgets of about 705,000,000 crowns against 1,703,000,000 crowns in 1933. The ordinary budget showed a deficit of 342,000,000 crowns on expenditures of 8,111,000,000 crowns, compared with an ordinary deficit of 1,553,000,000 crowns in 1933. The total budget for 1935 estimated receipts at 7,985,300,000 crowns and expenditures at 7,983,300,000 crowns, excluding fiscal monopolies and undertakings.

The public debt totaled about 43,000,000,000 crowns on June 30, 1935, as against 39,367,000,000 crowns on Dec. 31, 1934. The par value of the crown (koruna) through January, 1934, was \$0.0296. With the devaluation of the U. S. dollar it became \$0.0502. The crown in turn was devalued

on Feb. 17, 1934, to a par of \$0.0418. Average exchange value in 1933, \$0.0380; in 1934, \$0.0424.

Communications. Railway lines in 1933 extended 8800 miles (state lines, 7079). All railways in 1933 carried 38,080,000 tons of freight and 193,000,000 passengers. The highway network aggregated about 55,000 miles. The Danube, Vltava, and Elbe rivers are important traffic arteries. There were 22 air routes in operation in 1931 (16 international and six national).

Government. The democratic Constitution of Feb. 29, 1920, vested executive power in a President, elected for seven years by the two chambers of Parliament in joint session. The President appoints and recalls cabinet ministers. Legislative authority rests in a Senate of 150 members, elected for eight years, and a Chamber of Deputies of 300 members, elected for six years. President in 1935, Thomas Garrigue Masaryk, elected Nov. 18, 1918, and reelected in 1920, 1927, and 1934. Thirteen political parties were represented in Parliament in 1935, with no one holding a majority. The coalition ministry in office at the beginning of 1935 was headed by Jan Malypetr (Czechoslovak Agrarian).

HISTORY

The General Election. The general parliamentary election held May 19, 1935, brought fewer changes than might have been expected in a Parliament whose six-year tenure had carried it unchanged through the world economic depression and a period of epochal political developments in Europe. The standing of the Czechoslovak parties underwent little change but the German Social Democratic, Agrarian, and Catholic parties suffered heavily as a result of defections of their followers to the new Sudeten German party, led by the so-called "Czechoslovak Hitler," Konrad Henlein. The Sudeten German party polled 1,294,000 votes, or more than any other political group, and emerged with 44 seats in the Chamber, one seat less than the number captured by the largest Czech party.

The standing of the Czechoslovak parties in the new Chamber, with their previous standing in parentheses, was: Agrarians, 45 (46); Social Democrats, 38 (43); Communists, 30 (30); National Socialists, 28 (32); Czech Catholic People's party, 22 (25); Slovak Catholic People's party, 22 (19); National Democrats, 17 (14); Middle Class (Traders) party, 17 (12); Fascists, 6 (0). The standing of the German and Magyar minority parties was: Sudeten Germans, 44 (0); Social Democrats, 11 (21); Agrarians, 5 (16); Catholic People's party, 6 (16); Magyar and Sudeten-German electoral bloc, 9 (0). The German Nationalist and National Socialist parties, with 22 seats in the old Chamber, were absorbed by the Sudeten German party.

While the Sudeten German leaders professed their attachment to democratic government and their loyalty to the republic—a position they were obliged to take in order to prevent their party from being declared illegal—their organization was modeled on the Nazi movement in Germany. It made use of the same slogans and was run on the leadership principle. Charges that the party was inspired and financed from Berlin were emphatically denied by Henlein and his associates, but it was obvious that the emergence of such a strong German party would have far-reaching repercussions on future political developments. Its first result was to weaken the German parties of

the government coalition so seriously that the Malypetr Ministry resigned. Although Henlein sought representation for his party in the government, it was excluded in the new coalition government formed June 3, 1935, by Premier Malypetr. Representatives of the German Social Democrats and Agrarians again received cabinet posts. The principal change was the inclusion in the cabinet of the Middle Class (Traders) party, thus giving the government a safe majority, with 166 seats in the Chamber and 82 in the Senate.

In a declaration of policy before the new Chamber, a spokesman for the Sudeten Germans warned that the German people in Czechoslovakia would not accept a secondary rôle and that the party would continue to demand representation in the government and equal rights for Germans. He said, however, that the German minority recognized itself as a part of the nation and that his party would attempt to collaborate with the other groups in Parliament. Following the death of Bohumír Bradáč, the Czech Agrarian Speaker of the Chamber of Deputies, Premier Malypetr resigned on November 5 and the following day was elected Speaker of the Chamber. The Sudeten Germans demonstrated their coöperative attitude by voting in support of Malypetr's candidacy. The latter was succeeded as Premier by Dr. Milan Hodža, leader of the Czech Agrarian party. Dr. Hodža announced that there would be no change in the government's domestic or foreign policy. The ministry's domestic programme, announced earlier in the year, called for further aid to agriculture, reorganization of the tax system, a work relief programme for the unemployed, rehabilitation of the coal industry, and the introduction of the 40-hour week.

The influx of numerous refugees from dictator-ridden neighboring lands presented the government with another serious problem. Refugees were given sanctuary on condition that they renounced political activity and refrained from entering the already badly depressed labor market. However as many exiles were destitute and proved a burden to the country, the government in 1935 issued regulations restricting entrances and imposing a heavy tax upon well-to-do refugees. The Land Board, established in 1919 to carry out the redistribution of large estates, was dissolved on May 1, 1935, having terminated its work. The board had supervised the distribution among landless peasants, the former owners, and the state itself of some 10,000,000 acres, or 28.6 per cent of the total area of the country, previously held in 1913 estates.

President Masaryk Resigns. The oft-rumored resignation of Czechoslovakia's venerable President, Dr. Thomas G. Masaryk, who founded the republic and presided over its destinies since its birth in 1918, occurred on Dec. 14, 1935. He had delayed his retirement, necessitated by advancing years and ill health, pending the successful conclusion of negotiations among the political parties for the selection of Dr. Eduard Beneš as President Masaryk's successor. Dr. Beneš, the former student, protégé, and right-hand man of Dr. Masaryk, had been Foreign Minister for 17 successive years. He had established a reputation as one of the leading statesmen and probably the most experienced Foreign Minister in Europe. His election by a joint session of Parliament took place on December 18, with the support of the government coalition, the German Clericals, the Slovak People's party, the Communists, and part of the Hungarian minority party.

Foreign Relations. In the field of foreign af-

fairs, the principal developments of the year were the continuance and further development of strained relations with Germany and Poland, accompanied by a closer rapprochement with the Soviet Union. Czech fears of Germany were further aroused by unofficial reports that Hitler during his conferences with the British Foreign Secretary in Berlin in March had demanded the cession to the Reich of Czechoslovak territory occupied in part by the German minority of some 3,500,000 persons. Late in April the kidnaping by the Nazis of Josef Lampersberger, a German émigré, who was seized on Czechoslovak soil and carried across the border, proved a further cause of mutual irritation.

Polish-Czechoslovak friction, reawakened in 1934 as a result of the revival of Polish claims to Teschen and part of Slovakia, increased steadily during 1935. On October 18 the Czechoslovak Government expelled the Polish consul at Moravská Ostrava following his repeated criticisms of the treatment of the Polish minority in Teschen. Poland retaliated by expelling two Czechoslovak consuls. On October 28 10,000 Czechoslovaks staged a demonstration near the Polish border in Teschen as a warning of their determination to defend the territory to the last. Subsequently Czech officials in Teschen took severe measures to curb the violent acts and hostile demonstrations of the Poles in that district.

While not neglecting to strengthen their military forces, the Czechoslovaks tightened their newly developed bonds with Soviet Russia through the pact of mutual assistance signed on May 16, 1935. In June Foreign Minister Beneš visited Moscow to discuss mutual problems and in the same month his government announced that it would extend a credit of 250,000,000 crowns to the Soviet Government for the purchase of Czechoslovak products. A commercial treaty with the Soviet Union was signed March 25. On the same date an important clearing agreement was signed with Italy and on April 2 a provisional commercial agreement was concluded with the United States. See *LITTLE ENTENTE; POLAND under History*.

DAHOMÉY. See *FRENCH WEST AFRICA*.

DAIRYING. The outstanding feature of the dairy industry during 1935 was the unusually light production of dairy products, and especially butter during the first half of the year. Favorable conditions for the production of feed and pastures in the summer months permitted heavier feeding and increased milk production, notwithstanding a reduced number of milk cows. The drought of 1934 caused an acute feed shortage which made necessary reduction in the number of milk cows to about 25,100,000 head on Jan. 1, 1935. On that date milk production per cow was the lowest on record, being 5 per cent less than the low production of January, 1934. An intensive tuberculosis eradication campaign and disposition of cattle reacting to the Bang's disease, with \$30,000,000 of Federal funds supplemented by some State funds, had an important influence in reducing numbers of all classes of cattle.

Butter supplies were so low at the end of 1934 that considerable quantities of butter were imported during the first half of 1935. Notwithstanding a reduced domestic consumption and increased substitution of other fats, butter prices rose during the first few months of the year. Increased quantities of butter were imported, even over the 14 cent tariff. When crops and pastures for 1935 became available, the situation changed. Feeding was increased, and milk production per cow rose so that on August 1 and September 1 it was 10.6 and 8.0 per cent,

respectively, higher than on the corresponding dates of 1934. Notwithstanding the reduced numbers of milk cows, total milk production for the year 1935 was estimated at slightly less than for 1934.

Unusually heavy production of the principal manufactured dairy products was also reported during July, August, and September. As the consumption did not improve sufficiently, storage stocks were abundant in the fall. At that time prices of dairy products were low in relation to other farm products, and consequently feed supplies could be more profitably used for other classes of livestock.

A peculiarity of the production of manufactured dairy products was the changes in utilization. For example, in September production of butter was 2 per cent less than it was a year earlier, evaporated milk was down 6 per cent, but cheese production was 20 per cent larger than in September, 1934, and 40 per cent larger than the five-year average for that month. The production of condensed milk for December, 1935, was 43.4 per cent higher than in the corresponding month of 1934.

During the year 1935 creamery butter and cheese production totaled 1,634,000,000 lb. and 597,000,000 lb., respectively, a decrease of 3.6 and an increase of 3 per cent as compared with 1934. Condensed and evaporated milk production increased 9.7 and 9.1 per cent to 248,000,000 lb. and 1,868,000,000 lb., respectively.

Reference was made to the low consumption of butter which, during 1935 was 5.5 per cent less than in 1934. However, cheese consumption increased 5.2 per cent. For the apparent consumption of creamery butter, cheese, and condensed and evaporated milk, there was an estimated reduction of 2.6 per cent on a milk equivalent basis.

Encouragement for dairy interests was furnished by the increased movement of manufactured dairy products into channels of consumption in the fall. During September there was a reduction of 8,000,000 lb. in the storage stocks of butter, whereas in 1934 there was an increase of 5,000,000 lb. in the storage stocks of butter during that month. The decrease during October was twice as great in 1935 as in 1934. The total stocks of butter in storage on Dec. 1, 1935, were 72,000,000 lb. as compared with 81,000,000 lb. on the same date of 1934; and an average of 177,000,000 in the five years, 1930-34.

Cold storage holdings of American cheese on Oct. 1, 1935, were 102,633,000 lb., which were 6,000,000 lb. less than in 1934, but 15,000,000 lb. larger than the five-year average for 1930-34. Manufacturers' stocks of evaporated milk were high in the fall as a result of the reduced consumption. The total of 358,780,000 lb. in manufacturers' hands on September 1 was the largest ever reported for any month.

Some assistance in the marketing of dairy products was rendered through purchases by the Agricultural Adjustment Administration, during the early part of the year 1935, of several million pounds of butter, cheese, evaporated milk, and dry skim milk, which were distributed through relief agencies.

International Conditions. U.S.A. butter imports were not as large for any year since 1923 as they were during the first six months of 1935 when over 21,000,000 lb. were imported. On account of the tariff barrier, butter imports of the United States ordinarily amount to only about 1,000,000 lb. The imports increased progressively from December, 1934, until they reached 8,860,000 lb. during the month of April. As feeds and

pastures became available, domestic production increased and prices receded so that imports were no longer profitable. Butter imports during the first four months of the year were chiefly from New Zealand, but they continued from the Netherlands and Baltic States to a lesser extent during May and June. Butter production in Australia and New Zealand was heavy, although unfavorable weather conditions in New Zealand reduced the amount of butter graded in the first part of the Southern Hemisphere spring season.

Butter imports of the United Kingdom, amounting to 919,000,000 lb. were 22,000,000 lb. less during the first ten months of 1935 as compared with 1934; whereas, German imports amounting to 159,000,000 lb. during the 12 months' period of 1935, were 22,000,000 lb. greater than in the corresponding period of the previous year. The increased amount was due largely to increases in butter imports from the Continent, including Denmark, Russia, Sweden, Estonia, Finland, Austria, and France, although Denmark exported 10 per cent less butter during the first ten months of the year than in the corresponding period of 1934. Exports to Germany were increased 38 per cent.

Imports of cheese by the United States for the first time in several years were approximately equal to the preceding year. The imports during the 12 months of 1935 totaled 48,932,643 lb. Shifts in the source of the cheese imports were apparent. Swiss cheese imports were only a little more than 25 per cent of the imports of 1927, and Italian cheese imports declined materially from 1926 to 1933. Increases were shown in 1934 and 1935 as compared with the preceding year. Danish cheese exports to the United States have increased for several years, although the total cheese exports of Denmark in 1935 were less than in 1934.

Research. Knowledge of the factors underlying milk secretion have long been baffling. However, studies at the Missouri and New York Cornell Agricultural Experiment Stations showed that development of the mammary gland, as occurs near the end of gestation, could be induced in virgin heifers and rabbits by injections of a hormone from the follicle about the developing ovum. The mammary glands of such animals could be brought into active milk secretion within three days by the administration of galactin—a hormone of the pituitary gland.

Greater utilization of pastures for milk production results in cheaper feed, as labor costs in harvesting are reduced to a minimum. With the tendency to stabilize production more in accord with demand and the more keen competition arising in dairy production, there was increased interest in the use of pasture, forage, and roughages. The New Jersey Agricultural Experiment Station showed that more feed could be obtained from pasture over a longer period by dividing the pastures so that grazing could be rotated with fertilization at regular intervals. Dried young grass was found by the Vermont Agricultural Experiment Station to have a very high nutritive value for dairy cows.

Because of the large amounts of calcium in the milk, the importance of mineral supplements in the dairy ration is generally recognized. However, roughages and pasture vary greatly in their mineral content, depending largely on the minerals present in the soil on which the plants are grown. For example, the Pennsylvania Agricultural Experiment Station found that where adequate amounts of roughage were fed, the milking cows did not need minerals other than common salt in the ration. When the roughage consisted of inferior quality

mixed hay, the Massachusetts Agricultural Experiment Station found that additional sources of phosphorus were needed.

Because of the importance of vitamin D—the rickett-preventing vitamin—in infant nutrition, attempts were made to increase the amount of this vitamin in the milk. The Ohio Agricultural Experiment Station found that additional amounts of vitamin D could be obtained in the milk by feeding irradiated yeast to the cow or by irradiating the milk. It was also found that the addition of vitamin D concentrate to the milk permitted the production of a product more uniformly standardized for its vitamin D content. However, such milk was subject to the unfavorable psychological reaction of the consumer, and is in conflict with regulations against adding substances to milk.

Undesirable odors and off-flavors are a serious handicap in the marketing of fluid milk. The California Agricultural Experiment Station found that various feeds such as alfalfa hay, clover hay, musty hay, or corn silage if fed in too large amounts shortly before milking, imparted undesirable odors and flavors to the milk. On the other hand, when wheat bran was fed one hour before milking, a pleasing flavor was imparted to the milk. It was also found that there were characteristic undesirable flavors in the milk from some cows. In the study of the product, exposure to sunlight was found to impart an oxidized or tallowy flavor to milk.

The United States normally imports considerable quantities of foreign types of cheeses. Attempts were made to produce such cheese in the United States. Roquefort has been successfully manufactured from cow's milk under rather definite conditions in studies by the U.S. Department of Agriculture. The Minnesota and Iowa Agricultural Experiment Stations also produced a satisfactory roquefort cheese. Caves in Sandstone Bluffs, along the Mississippi River in Minnesota, were found by the former station to be particularly well suited for ripening the cheese.

Fire destroyed the experiment station dairy barn at Clemson College, South Carolina, on February 6, but the station herd was fortunately saved. Most of the experiment station dairy plant at Fallon, Nevada, was burned on Nov. 10, 1934. A new, enlarged barn was erected in its stead.

Changes in Personnel. Prof. F. W. Atkeson, head of the dairy husbandry department at the University of Idaho, was appointed head of the dairy department of Kansas State Agricultural College, effective April 1, to succeed J. B. Fitch. Prof. D. R. Theophilus succeeded Prof. Atkeson as head of the dairy department at the University of Idaho. Prof. T. R. Warren, of the same institution, resigned to become field representative of the American Jersey Cattle Club in the Western States.

Bibliography. The following is a list of recent publications of general interest in dairying: *Proceedings of the 29th Annual Meeting of the American Dairy Science Association*, (Jour. Dairy Science, 18 [1935], No. 7, pp. 429-82); *Breeding Profitable Dairy Cattle; a New Source of National Wealth*, by E. P. Prentice, (Boston, Houghton Mifflin, 1935); *Le contrôle des vaches laitières dans le monde* (Internat. Inst. of Agr. Bur. Agr. Sci., Rome, 1935); *The Effects on Calcium and Phosphorus Metabolism in Dairy Cows of Feeding Low-Calcium Rations for Long Periods*, by E. B. Meigs, W. A. Turner, E. A. Kane, and L. A. Shinn, (Jour. Agr. Res., 51 [1935], No. 1, pp. 1-26); *Fundamentals of Dairy Science*, by associates of L. A.

Rogers in the research laboratories of the Bur. of Dairy Indus., U.S. Dept. Agr. (New York, 2d ed. Reinhold Pub. Corp., 1935 [Amer. Chem. Soc. Monograph Ser. No. 41]); *Practical Dairy Tests and Fundamentals of Dairying*, by A. D. Burke, (Milwaukee, Olsen, 1935); *The Milk Problem*, by R. M. Love, (London, F. R. DAMS. Now that work in the greatest of all dams, the giant of Boulder Canyon, is rapidly drawing to a close, the remarkable accomplishment of American engineering and engineering-contracting skill stands out in clear relief.

Bonneville Dam. This concrete spillway dam, 1250 ft. long and 170 ft high, is not in quite as gigantic a scale as that farther up the Columbia at Grand Coulee, but it does present a most difficult construction problem. In fact, the major difficulty in building this work probably centres on the cofferdam construction needed to secure the foundations. The cofferdams are being placed in water 30 to 50 ft deep and in currents up to 7 miles per hour on a rough and irregular river bed—a most difficult undertaking. The first half of the cofferdam was placed in the winter of 1934-35, the period of low flow. Some 200,000 cu. yd. of excavation was completed before summer floods required the removal of all equipment and the filling of the 8-acre area. In the fall, the cofferdam was again pumped out, excavation was completed, and a concrete foundation placed. A similar process was to be followed for the north half of the channel.

Boulder Dam. This dam, one of the modern wonders of the world, will be completed two years ahead of schedule. Water was first stored back of the dam in February, 1935, and the main structure is practically complete. Indeed, the principal remaining work is that in connection with the penstocks and power houses. Late in December, the last section of the huge penstocks was lowered into place and it was expected that power production would begin early in 1936.

Conchas Dam. The U.S. Army Engineers began work on a 6½ million cubic yard earth fill dam on the Conchas River near Tucumcari, N. M.

El Vado Dam, N. M. Rock fill dams using steel diaphragms or decks have been constructed in the past, but, in such recent great works as the Dix River Dam in Kentucky, and the Salt Springs work of the Pacific Gas & Electric Co. in California, a reinforced concrete steel deck has been adopted. Now, with the construction of the rock fill El Vado Dam in New Mexico, a rock fill dam 175 ft. high, there has been a return to the older steel diaphragm type of construction. In fact not only is steel used as a metal fan plate for the dam but also for a wave parapet and as lining for the spillway.

Fort Peck Dam. One hundred million cubic yards of earth will be required for this tremendous earth mountain which is being built as a relief measure high up on the Missouri in Montana. The only shipyard ever built in Montana turned out four huge suction dredges with 7 ft. diameter cutters, which are being used to secure the fill needed

for this work. The dam will be 250 ft. high and is located at a point where the river is $1\frac{1}{2}$ miles wide, thus requiring a volume of fill many times larger than any similar work ever undertaken by man. A cut-off of steel sheet piling has been driven from 140 to 190 ft. below the valley on the centre line of the dam and the dredges are now pumping in the required fill. Everything about the structure is on a similar gigantic scale. The spillway is to be 2 miles long and requires 13 million cubic yards of excavation. Four huge diversion tunnels have been driven, totaling over $4\frac{1}{4}$ miles in length.

The Fort Peck Dam will store $19\frac{1}{2}$ million acre-ft. of water which will be released to maintain navigable depths in the river between St. Louis, Mo., and Sioux City, Ia., during periods of low flow. It will also serve for flood control and, perhaps, its waters may some day be used for irrigation.

Grand Coulee. While the economic value of the two great works on the Columbia River—the Grand Coulee and the Bonneville Dams—now being undertaken by the Federal Government, may be seriously questioned, the purely technical features of their design and construction are worthy of special study.

When we reflect that the principal object of these works was to aid unemployment and revive the construction industry in this area, it is upsetting to discover that the construction plant at Grand Coulee is hailed as the last word and a high water mark in the mechanization of concrete construction. A huge concrete mixing plant has been constructed on concrete stilts, 240 ft. high, against the steep western wall of the valley. This plant has a designed capacity of 320 cu. yds. of concrete per hour and a similar plant is projected for the other end of the dam. The first of the 4 million cu yd of concrete required for this dam was placed on December 6. The work is being done by contract and under the direction of the U.S. Bureau of Reclamation.

Roller-Gate Dams. In those conditions which require that a practically uninterrupted channel be provided during flood flows, the only kind of dam available is one of the several gate-types. The roller-gate has the advantage of providing great spans—up to 100 ft.—between supports, and ease and reliability of operation. Several such dams have been built in the United States—one at Belows Falls, Vt., the Grand Valley Dam on the Colorado, and several others in connection with river canalization work. In the new work of the U.S. Engineers on the upper Mississippi, this type, suitable for a diversion dam or for moderate head constructions only—say up to 20-odd ft. max.—has been adopted for such notable installations as that at Alton, Ill.

San Gabriel Dams. THE The checkered history of the various attempts of the Los Angeles County Flood Control District, organized in 1924, to build retention reservoirs in the San Gabriel Canyon has been noted in previous YEAR BOOKS. Originally \$25,000,000 was allocated from the total bond issues to construct a concrete dam, of then unprecedented height, at the Forks site in the Canyon. After large sums had been spent in excavation at this site in 1929, the safety of the proposed structure was questioned, the plans disapproved, and the contract canceled. Surveys were then made at No. 1 dam site for a rock-fill dam 375 ft. high. Litigation delayed the work. All bids submitted in the first two different calls for bids were rejected. Finally, however, late in 1932 a contract was awarded to the West Slope Construc-

tion Co. Difficulties in securing suitable rock—in the earlier stages of the work little more than $\frac{1}{10}$ of that excavated in the quarry actually went into the work—the resignation of the chief engineer, and the advent of new consultants, led to two reports late in 1934. Work was suspended but new plans were approved and construction resumed last August. With flatter slopes and provision for jetteting the fill in some five zones of the structure, the work is again under way.

Tennessee Valley Authority Dams. THE Probably one of the most interesting features of the Norris Dam of the TVA project is the extraordinary effort which has been made to secure watertightness, in the dolomite which underlies the structure, through grouting. The grouting programme, made necessary by the fact that hidden channels in this rock threatened to provide passages for underflow, was the most elaborate ever attempted. Huge borings, 36 in. in diameter and thus large enough to permit a man to be lowered into the hole, made a direct examination of the foundation conditions possible. The effectiveness of the pressure grouting operations was later carefully checked by $5\frac{1}{2}$ in. core drillings.

Below this structure, and only $15\frac{1}{2}$ miles above the Wilson (or Muscle Shoals) Dam, completed during the World War, is the Wheeler Dam. This interesting structure, 6400 ft. long, is now in its final year of construction.

A third dam, at Pickwick Landing 50-odd miles below the famous Wilson Dam at Muscle Shoals, has also been started by the TVA. Although ultimately intended as a power site the Pickwick Dam is to be built at first only for navigation. It will provide a minimum of 9 ft. for the least navigable stretch of the lower river. An ogee concrete spillway, 43 ft. high and 1156 ft. long, is to be controlled by means of gates each 40 by 40 ft. in size. When Wheeler Dam, above Muscle Shoals, is completed and a limited amount of dredging is done below Pickwick, a 7 ft. channel will be available for 358 miles of the river up from the Ohio under low flow conditions.

FOREIGN DAMS

Chambon Dam, France. This gravity type water-power structure, under construction on the Romanche River in southeastern France, will surpass the Sautet Dam in height. Rising 790 ft. above the streambed, the maximum section of this dam will be 450 ft. high. The foundation is principally gneiss but contains two areas of dolomitic limestone. Extraordinary provisions were made for grouting this material. Some two miles of grout holes were used in the effort to seal the foundations and the amount of grout used exceeded all expectations. One of the lower holes in the gneiss absorbed nearly 46 tons of cement.

Sautet Dam, France. This is the highest dam in Europe and apparently surpassed in height only by Boulder Dam. This constant-angle arch structure rises 414 ft. above the lowest point in a narrow valley of the Drac River, in the French Alps about 45 miles from Grenoble. Less than 50 ft. wide at the narrowest point, the Sautet Gorge is 600 ft. deep and furnishes an ideal site for an arch dam. The valley walls, however, are a limestone formation, recognized as a somewhat treacherous material for dams, and special precautions, including elaborate grouting and a backing of lean concrete, to buttress the canyon walls, were taken to prevent seepage. The unusual arrangement of the power house, partly in a gallery cut in the rock and partly in a reinforced concrete

structure spanning the gorge, makes this a unique and most interesting work.

Molare Dam, Italy. This dam, located on the Orba River in Italy, a gravity type water-power structure 150 ft. high, failed on August 12. Below the site, about 30 miles from Genoa, were several towns and the flood waters did considerable damage.

DANA, EDWARD SALISBURY. An American geologist, died June 16, 1935, at New Haven, Conn., where he was born, Nov. 16, 1849. He was graduated from Yale University in 1870, and subsequently studied at Sheffield Scientific School, particularly mineralogy and chemistry, and at Heidelberg and Vienna. In 1874 he joined the faculty of Yale University as a tutor and five years later became assistant professor of natural philosophy. In 1890 he was appointed professor of physics, becoming professor emeritus in 1917. From 1870 to 1922 he was curator of the mineralogical collection at the University, and from 1885 to 1929 was a trustee of Peabody Museum, Yale University.

He and his father, James Dwight Dana, were considered the foremost American pioneer research students and world authorities in the field of geology. On the death of the elder Dana, his son continued the father's work. In 1875 he took over the editorship of *The American Journal of Science*, which had been founded and edited by his great grandfather, Benjamin Silliman, in 1818. In 1926, he turned this Journal over to Yale University, and there it has become an integral part of the publications of the Yale Press.

Professor Dana was a member of many scientific societies, and in 1934 was made an honorary life member of the American Museum of Natural History and of the New York Mineralogical Club. In 1925, the Mineralogical Society of America elected him honorary president for life. At his death, the Yale University Corporation passed a resolution, which read in part: "Foremost American geologist of his time, he brought to himself and to the University widespread recognition in the world of science."

Dr. Dana supplied the 2d and 3d appendices to the 5th edition of his father's great work, Dana's *System of Mineralogy* (1875-82), and in 1892 completed his revision of the 6th edition of this same work, which had taken him ten years. His own publications were: *Text Book of Mineralogy* (1877, new ed., 1898); *Text Book of Elementary Mechanics* (1881); *Minerals and How to Study Them* (1895), and many papers on minerals to technical periodicals.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANZIG, dan'sik, FREE CITY OF. A Baltic port at the mouth of the Vistula River, which, with the surrounding territory, was constituted a Free City by articles 100 and 102 of the Treaty of Versailles. Area, 754 square miles; population on Jan. 1, 1934, 410,000. Births in 1933 numbered 7719; deaths, 4671; marriages, 3769. In 1934 there were 53,548 pupils in elementary schools, 4198 in middle schools, 5319 in high schools, and 1548 in the Technical University. The German language is spoken.

Commerce and Shipping. Once the main outlet for the trade of Poland and a large sector of north central Europe, Danzig has been forced to share this business with the new Polish port of Gdynia. Sea-borne imports in 1934 were valued

at 219,240,000 gulden; exports, 98,400,000 gulden. In 1933 the chief exports through the port were: Grain, 397,030 tons; sawn timber, 725,859 tons; sugar, 5238 tons. The net tonnage of over-seas shipping entering the port with cargo and in ballast in 1934 was 3,175,000 (2,763,000 in 1933); tonnage cleared, 3,165,000 (2,734,000 in 1933). The merchant marine on July 1, 1935, consisted of 17 steamers of 17,309 gross tons and 24 motor ships of 248,653 gross tons.

Government. Danzig is under the protection of the League of Nations, which is represented by a High Commissioner. Under the Treaty of Versailles the Free City is included in the Polish customs administration and its foreign relations are controlled by Poland. The territory exercises a large measure of autonomy through a Diet of 72 members elected by universal secret suffrage. The Diet in turn elects the President, Vice President, and 10 Senators for an indefinite period. The Senate, which includes the President and Vice President, is the executive and administrative arm of the government. Its meetings are private. President in 1935, Arthur Greiser (National Socialist), elected Nov. 28, 1934. High Commissioner of the League of Nations, Sean Lester (appointed Oct. 26, 1933). High Commissioner of Poland, Dr. Casimir Papée.

History. The attempt of the National Socialist majority in Danzig to impose a totalitarian régime upon the Free City encountered repeated snags in 1935, but kept the territory in turmoil throughout the year. While the Nazis held 38 out of 72 seats in the Danzig Diet, they lacked the two-thirds majority needed to amend the Constitution in accordance with their plans. Accordingly the Nazi majority voted to dissolve the Diet on Feb. 21, 1935, although the members still had two years to serve. New elections were called for April 7. The Nazis confidently predicted that the Danzig Germans, comprising 95 per cent of the total inhabitants, would demonstrate their overwhelming attachment to National Socialist principles and give the Nazis a mandate to establish a totalitarian state. This step, it was indicated, would be the preliminary move towards the reincorporation of Danzig in the German Reich, even though this would involve another breach of the Versailles Treaty.

In the electoral campaign the Nazis, with strong support from Germany, left nothing to chance. They carried out the familiar high-pressure electioneering procedure which had proved so successful in Germany and in the Saar. Party leaders from Germany, including Goering, Hess, Goebbels, and Streicher, were imported to address huge and colorful mass meetings. Danzig was plastered with Nazi posters and swastika banners, while the opposition elements were largely prevented from campaigning. Nevertheless the Nazi failed by five seats to win the two-thirds majority required to change the Constitution. Their popular vote of 30,000 comprised 59 per cent of the electorate, as compared with 51 per cent voting National Socialist in May, 1933. The Nazis elected in all 43 deputies as against 29 returned by the opposition Socialists, Catholics, and Poles. The election thus conclusively demonstrated that a large number of the German Socialists and Catholics in Danzig were not prepared to accept Nazi principles. The high tension generated during the campaign continued for some time, especially between the Nazis and the Poles. Anti-German demonstrations in the Polish Corridor followed the repressive measures

adopted by the Nazis towards the Polish minority in Danzig.

Although unable to amend the Constitution, or to dispense with it in the face of the League of Nations and of Poland, the Nazi government in Danzig proceeded to carry out its totalitarian principles as far as possible. Opposition newspapers were censored or suppressed. A force of about 1000 gendarmes was organized, in addition to the police, but this was suppressed on October 21 after Poland had registered a vigorous protest. On September 5 the Senate introduced a series of penal ordinances which practically duplicated those in force in Germany and which gave the government arbitrary powers of arrest and imprisonment against any one charged with being "a menace to the public order." The minority groups protested to the League, contending that these laws violated the Free City's Constitution, and their contention was upheld in an advisory opinion rendered by the World Court at The Hague on December 4. The League Council in September appointed a committee, with Anthony Eden of Great Britain as rapporteur, to investigate claims of the Danzig minorities that the Nazi government had infringed their rights in other respects. Action on this issue was still pending at the close of 1935.

Meanwhile Danzig had become involved in serious financial difficulties, leading to complications with Poland which threatened to disturb friendly Polish-German relations. Since its assumption of control in May, 1933, the Danzig Nazi government had been subsidized to the extent of nearly \$600,000 monthly by the Reich. After the election of April 7, however, the subsidies ceased, due partly to the growing financial stringency in Germany. Germany also defaulted on debts aggregating some \$2,500,000 due to Danzig for agricultural produce exported to the Reich. These developments led to a serious budget shortage in Danzig, where the German subsidies had been spent in a great public works programme. The gold coverage for the Danzig gulden fell to 35 per cent—5 per cent under the legal minimum—and on May 2 the Danzig authorities were forced to devalue the gulden by 42.37 per cent.

Depreciation of the currency in Danzig started a flight from the gulden which led the authorities to proclaim a banking moratorium on June 4 and to impose a rigid foreign exchange control system on June 12, together with strict measures of governmental economy. It was hoped in this way to prevent the Polish zloty from replacing the gulden as the prevailing medium of exchange. The Poles, asserting that the Danzig exchange control measures violated Polish-Danzig commercial agreements, took retaliatory measures. Polish railways refused to accept payment in gulden for shipments to Poland and on July 18 the Warsaw government issued a decree which in effect prohibited all imports into Poland via Danzig, thus diverting practically all the city's transit trade to the rival Polish port of Gdynia. Danzig retaliated on August 1 by abolishing duties on most of its imports from Germany, thus in effect terminating the Polish-Danzig customs union and uniting Danzig economically to the Reich. These developments were accompanied by mounting hostility on both sides and border guards were reinforced. The Reich Government apparently intervened to end the tension and late in September the Danzig and Polish authorities reached a mutually satisfactory settlement of the currency issue. Poland withdrew

its order forbidding the collection by Danzig of customs duties on goods shipped to Poland and Danzig ended its free market for German imports. See GERMANY and POLAND under *History*.

DARTMOUTH COLLEGE. A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1935 autumn session had an enrollment of 2460 students. There were 272 members on the faculty. The endowment amounted to \$17,209,301, while the income for the year was \$457,437. The Fisher Ames Baker Memorial Library contained 402,279 volumes. President, Ernest Martin Hopkins, LL.D.

DAVIS, KATHARINE BEMENT. An American sociologist, died at Pacific Grove, Calif., Dec. 10, 1935. Born in Buffalo, N. Y., Jan. 15, 1860, she graduated from Vassar College in 1892, when she took charge of the College Settlement House in Philadelphia. Here she served for five years when she became a fellow in political economy at the University of Chicago. She again held this fellowship in 1899-1900, and received the degree of Ph.D. The previous year she held the fellowship of the New England Women's Educational Association at Berlin and Vienna.

In 1901, Miss Davis was appointed superintendent of the State Reformatory for Women at Bedford, N. Y., which was then newly opened with one inmate, and under her forceful and capable administration became famous among penologists. It was her belief that the punishment should fit the criminal rather than the crime, and she inaugurated the plan of giving the women congenial occupation. In 1911, when the Bureau of Social Hygiene was founded, she served on the original Committee, and it was largely through her efforts that advanced methods for the reclamation of the women committed to the care of the State were introduced at Bedford. On Jan. 1, 1914, Mayor John Purroy Mitchel, of New York City, selected her as Commissioner of Correction for that City, the first woman to hold the position. Her administration of that office showed the same firmness displayed at Bedford. In the following year she became Chairman of the Parole Commission, but relinquished that office in 1917 to become General Secretary of the Bureau of Social Hygiene in 1918, from which she retired in 1928. In that same year she served also as director of the section on women's work of the Division of Social Hygiene of the Commission on Training Camp Activities. At the outbreak of the World War, she became chairman of the Committee of Mercy, which raised almost \$3,000,000 for the relief of women and children. At the entrance of the United States into the War, the fund was taken over by the Red Cross.

Further proof of Dr. Davis' capabilities was given in 1908, when she was visiting at Messina, Italy, at the time of the earthquake. She immediately took charge of relief service, and for three months labored long and strenuously, and for her activities was decorated by the Italian Government and the American and Italian Red Cross Societies.

In 1915, she lectured at Columbia University on good government, and she was the author of *Factors of the Sex Life of 2200 Women*, a study sponsored by the Bureau of Social Hygiene.

DEBTS. See UNITED STATES under *Administration*; PUBLIC FINANCE; REPARATIONS AND WAR DEBTS.

DE KAY, CHARLES. An American poet and critic, died in New York City, May 23, 1935. Born in Washington, July 25, 1848. After receiving part

of his early education abroad, he was graduated from Yale University in 1868. Following his graduation he went to Paris where he remained for several years. Returning to America, he entered upon an artistic and literary career, becoming in 1876, literary and art editor of the *New York Times*. He held this position until 1894, when President Cleveland appointed him consul-general at Berlin. For three years he served in that city returning to the United States in 1897, when he again turned to literature as a career. In 1907 he became art editor of the *New York Evening Post*, and from 1915 to 1917 he was an associate editor of *Art World*. Until 1928, he was a frequent contributor to the *New York Times Book Review*.

Mr. De Kay's first published volume was *The Bohemians* issued in 1880. During the three years that followed he published *Hesperus and Other Poems* (1880); *Vision of Nimrod* (1881); *Vision of Esther* (dramatic poems) (1882); *Love Poems of Louis Barnaval* (1883). This last-named book attracted considerable attention and the reviewer in the *Nation* said, "This remarkable volume takes a stride . . . far in advance of anything yet done by Mr. De Kay." Edmund C. Stedman, in his *Poets of America* said that *Poems of Barnaval* showed "his impassioned and more subjective moods and his resources for a prodigal display of varied, uneven, but strongly lyrical work."

Always an ardent fencer, in 1882 he founded the Fencers' Club, and in 1895 organized the Berliner Fecht Klub, also devoted to fencing. Also he was instrumental in the establishment of the Authors' Club in 1881; the National Sculpture Society in 1882, and the National Arts Club in 1898.

In addition to Mr. De Kay's other contributions to literature already cited may be included: *Life and Works of Barye, Sculptor* (1889); *Bird Gods* (Studies of myths and religions in ancient Europe) (1898); *Life and Works of Louis C. Tiffany*. He also contributed "Essays on Ireland" to the *Century Magazine* and "Wonders of the Alphabet" to *St. Nicholas* and issued translations from the French of Daudet and Rolland, and *Familiar Letters of Heinrich Heine* (1890), translated from the German.

DELAWARE. Population. On Apr. 1, 1930 (Fifteenth Census), 238,380; July 1, 1934, by latest Federal estimate, 242,000; 1920 (Census), 223,003. Wilmington had (1930) 106,597 inhabitants; Dover, the capital, 4800.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu.	Value
Corn	1935	144,000	4,464,000	\$2,678,000
	1934	141,000	4,864,000	3,891,000
Hay (tame)	1935	74,000	125,000 ^a	1,462,000
	1934	71,000	125,000 ^a	1,600,000
Wheat	1935	85,000	1,658,000	1,310,000
	1934	81,000	1,539,000	1,400,000
Sweet potatoes . . .	1935	7,000	840,000	504,000
	1934	6,000	810,000	624,000

^a Tons.

Education. The number of the State's inhabitants of school age approximated 53,000. The enrollments of pupils in the public schools in 1935 totaled 45,278. Of these, 27,926 were in common schools or elementary grades; in high schools, 17,352. The expenditures of the academic year 1934-35 for public-school education totaled \$6,208,577, of which \$3,717,578 was current expenditure, \$2,301,382 capital outlay, and \$189,617 for service of debt. Salaries of teachers averaged, for the year,

\$1381. Classes in adult education were continued, and the enrollment in these classes rose to 6422. A general reduction in teachers' salaries, at a scale of rates, from 5 per cent on the first \$200 above \$1000, up to 20 per cent on all excess over \$5000, was in effect in the academic year 1934-35.

Charities and Corrections. The central activity of the State, with regard to institutions, organizations, and agencies of eleemosynary or correctional character supported or aided by public funds, was the State Board of Charities. It was composed of five ordinary members and the Governor *ex officio*; three members were chosen from the respective counties and two at large. The Board was required to visit institutions, organizations, and agencies once a year. It rendered services in investigating paroles and the cases of the nonresident poor, licensed the boarding homes and agencies of placement for dependent children, investigated, when required, the management of any benevolent or correctional institution, investigated cases of need among minors, cared for such minors as were committed to its care, and administered the sterilization law.

Legislation. The State's taxation of incomes was made to apply to all persons having net incomes of as much as \$100. This measure had for its reported purpose the putting of individuals under compulsion, through legal penalties, to make returns of income, in order that fraudulent applications for public aid to the needy unemployed might be detected.

Political and Other Events. Figures published by the FERA on March 1 indicated that Delaware had distinguished itself in 1934 by paying within a fraction of a per cent of one-half of the cost of public support granted to its destitute unemployed in 1934. Of the total of such grants, \$1,645,697, the Federal part came to 50.4 per cent; contributions of the State and a slightly greater total of contributions from local bodies made up the remainder. The year's cost of this aid in Delaware, coming to substantially less than \$8 per capita of the population, compared favorably with a corresponding figure of some \$12 for the entire nation.

Officers. The chief officers of the State, serving in 1935, were: Governor, C. D. Buck; Lieutenant-Governor, Roy F. Corley; Treasurer, Warren T. Moore; Auditor, J. Henry Hazel; Secretary of State, Walter Dent Smith; Attorney-General, Percy W. Green.

Judiciary. Chancellor, Josiah O. Wolcott; Chief Justice of the Supreme Court, Daniel W. Layton; Associate Judges, Richard S. Rodney, David J. Reinhardt, William W. Harrington, Charles S. Richards.

DELLENBAUGH, FREDERICK SAMUEL. American artist and author, died in New York City, Jan. 29, 1935. Born at McConnelsville, O., Sept. 13, 1853, he was educated in Buffalo, New York City, Munich, and Paris, and studied for a time with Carolus Duran and at the Académie Julian. He joined Major Powell's second expedition down the Colorado River in 1871 as artist and assistant topographer. In that capacity he helped draw the first map of the Grand Canyon region. In 1899 he was a member of the Harriman expedition to Alaska and Siberia, and later made voyages to Iceland, Spitsbergen and Norway. He went on an exploration trip to the West Indies and South America in 1906 and three years later became librarian of the American Geographical Society. He held this post until 1911. From 1925 he was

secretary of the John Burroughs Memorial Association.

One of the early members of the Explorers' Club, he served as its vice president from 1922 to 1928. A fellow of the American Ethnological Association, he was a member of the American Association for the Advancement of Science. The John Burroughs Memorial Association awarded him its medal for the best work relating to nature in 1932 for his *A Canyon Voyage*, originally published in 1908 and reprinted in 1926. Well-known for his pictures of Indian scenes, a collection of his paintings now hang in the Museum of the American Indian. Besides contributing to Sturgis's *Dictionary of Architecture*, to the second edition (1914-15) of the *NEW INTERNATIONAL ENCYCLOPEDIA*, he wrote: *The North Americans of Yesterday* (1900); *The Romance of the Colorado River* (1903, 3d ed., 1909); *Breaking the Wilderness* (1905); *Frémont and '49* (1913, 2d ed., 1914); *Life of Gen. George A. Custer* (1916).

DE MOLAY, ORDER OF. A nonsectarian secret organization for young men between the ages of 15 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templars. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The Order is governed by a Grand Council of Freemasons among which are included Gen. James G. Harbord, F. Trubee Davison, and Dr. Chas. H. Mayo, while the Chapters are sponsored by Masonic Bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1934, the active membership numbered approximately 160,000. The organization has an alumni of more than 800,000 men. The official organ is *International De Molay Cordon* (monthly). Frank S. Land, the founder, is Secretary General; Franklin D. Roosevelt is Honorary Grand Master; Jesse M. Whited, San Francisco, is Grand Master; Geo. H. Dern, Deputy Grand Master; and Maj. Gen. M. W. Ireland, Grand Senior Councilor. Dr. Stratton D. Brooks is Executive Director of the Secretary General's staff. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

DENISON UNIVERSITY. A coeducational Christian college of liberal arts in Granville, O., founded in 1831. The enrollment for the autumn of 1935 was 836. The 1935 summer session had an enrollment of 125. The endowment was \$3,759,200 and the income for the year \$297,700. There were 81,000 volumes in the library. Ground was broken for the erection of a new library building. President, Avery Albert Shaw, A.M., D.D.

DENMARK. A kingdom of northwestern Europe, comprising the peninsula of Jutland, the two main islands Zealand and Funen, with about 200 smaller adjacent islands in the Baltic, the Faroe Islands, and Greenland. The King of Denmark is also King of Iceland (q.v.). Capital, Copenhagen (København). King in 1935, Christian X, who succeeded to the throne May 14, 1912.

Area and Population. Excluding outlying possessions, Denmark has an area of 16,576 square miles and a population estimated in 1934 at 3,656,000 (3,550,656 at 1930 census). Living births in 1934 numbered 65,120; deaths, 38,106; marriages, 34,758. Populations of the chief cities in 1930 were: Copenhagen, with suburbs, 771,168; Aarhus, 81,-

279; Odense, 56,759; Aalborg, 44,365. Lutheranism is the established religion.

Education. There is no illiteracy. The school attendance as of Jan. 1, 1933, was: Elementary, 501,054; secondary, 55,422; University of Copenhagen (1932-33), 6025; University of Aarhus (opened Sept. 11, 1933), about 120. There are also various technical and vocational institutions.

Production. Agriculture and dairying are the main occupations and farm products normally account for three-fourths of the value of all exports. In 1934 there were 5,572,000 acres of arable land, 1,334,000 acres of meadow and pasture, and 859,000 acres of forest. Crop yields in 1934 were: Wheat, 12,493,000 bu.; rye, 11,023,000 bu.; barley, 43,634,000 bu.; oats, 67,516,000 bu.; potatoes, 50,338,000 bu.; sugar beets, 1,050,000 metric tons; forage roots, 20,890,000 metric tons; hay, 1,900,000 metric tons. Beet sugar production (1934-35) was 91,000 metric tons. Livestock in 1934 included 3,113,000 cattle, 3,130,000 swine, and 525,000 horses. Animals slaughtered in 1934 numbered 860,000 cattle and calves, 65,000 sheep and goats, and 4,898,000 swine. Production of bacon was 780,000,000 lb.; butter, 403,000,000 lb.

Output of the leading industries in 1934 was: Pork and pork products, 653,825,000 lb.; shipbuilding, 62,312 gross tons launched; wheat flour, 1,645,000 bbl.; milk (condensed, powdered, etc.), 68,499,000 lb.; margarine, 158,176,000 lb.; cotton yarn, 16,826,000 lb.; cotton cloth and articles, 12,467,000 lb.; cement, 770,000 metric tons; paper and cardboard, 118,087,000 lb. The index of industrial production (Base: 1929 equals 100) was 105.0 for 1933, 117.0 for 1934, and 121.0 for 1935. There were 114,256 unemployed union workers at the end of 1934 (131,930 at end of 1933).

Foreign Trade. General imports in 1934 were valued at 1,353,000,000 crowns (1,266,000,000 in 1933) and exports of Danish products were valued at 1,176,000,000 crowns (1,163,000,000 in 1933). The United Kingdom supplied 30.1 per cent of the 1934 imports (28.1 in 1933); Germany, 21.3 (22.7); Sweden and Norway, 9.6 (9.3); United States, 6.1 (6.0). Of the 1934 exports, the United Kingdom purchased 59.9 per cent (64.4 per cent in 1933), Germany, 15.3 (13.1); Sweden and Norway, 9.5 (7.3). Iron and steel, mineral oils, coal, fertilizers, and automobiles are leading imports.

Total imports in 1935 were valued at 1,329,294,000 crowns and exports at 1,261,080,000 crowns. United States statistics showed imports from Denmark in 1935 of \$3,336,700 (\$1,898,075 in 1934) and exports to Denmark of \$12,480,774 (\$14,507,260 in 1934).

Finance. Budget estimates for the fiscal year ended Mar. 31, 1936, placed current receipts at 395,740,000 crowns (367,398,000 in 1934-35) and current expenditures at 394,430,000 crowns (377,508,000 in 1934-35). These estimates excluded capital accounts in which heavy deficits were expected. The 1934-35 ordinary budget closed with a surplus of 18,000,000 crowns, compared with a deficit of 16,567,000 crowns in 1933-34 (actual 1933-34 receipts, 376,499,000 crowns; expenditures, 393,066 crowns). The public debt on Mar. 31, 1934, totaled 1,292,000,000 crowns (internal, 622,000,000; external, 670,000,000), or about 350 crowns per capita. The crown (krone) exchanged at an average of \$0.1883 in 1932, \$0.1907 in 1933, and \$0.2250 in 1934. Par value after January, 1934, \$0.4537.

Communications. On Mar. 31, 1934, there were 3216 miles of railway line (state, 1555 miles; private, 1661 miles). In the year ended Mar. 31,

1934, the railways carried 41,261,000 passengers and 7,493,000 metric tons of freight, the gross receipts being 120,178,000 crowns. Highways extended 4779 miles. The new highway and railway bridge between Jutland and the island of Funen, which reduced the traveling time between Copenhagen and London by seven hours, was opened in May, 1935. The net tonnage of vessels in the overseas trade entering Danish ports with cargo and in ballast in 1934 was 12,247,000 (12,165,000 in 1933).

Government. The Constitution vests executive power in the King, who acts through a cabinet responsible to the Rigsdag (Parliament). The Folketing (lower chamber) has 149 members elected for four years by proportional representation; the Landsting (upper chamber), 76 members, of whom 19 are elected by the Landsting itself and the remainder indirectly by voters over 35 years of age, the term being eight years. Premier in 1935, Th. A. M. Stauning (Social Democrat), heading a coalition of the Social Democratic and Radical parties.

History. The decline in prices received for Danish agricultural exports continued during most of 1935—due in part to the gradual restriction of the British market—without a corresponding decrease in the level of the Danish cost of living. The resulting hardships imposed upon the Danish farm population were intensified by the increasing burden of servicing the large farm indebtedness. The Stauning Government took a number of steps calculated to relieve the agricultural situation. It followed a cheap money policy to facilitate the conversion of farm mortgages to lower interest rates and established a special fund to promote such operations. It also introduced a bill for the conversion of Danish Credit Association bonds to lower interest rates, but this was rejected by the Rigsdag on Jan. 22, 1935. The law of Aug. 31, 1935, imposed import taxes on cereals, malt, and fodders, the proceeds being diverted to the relief of agriculture.

These measures, however, failed to check discontent among the farmers, who demanded further depreciation of the crown-sterling exchange rate from the existing rate of 22.40 to 30 crowns to the pound. So much Danish farm produce was sold in Britain that a lowering of the exchange rate would increase the farmers' income in crowns without a corresponding increase in the cost of living and in the debt burden. In addition the farmers desired a reduction of taxes. In an attempt to force the Socialist-Radical government to adopt these policies between 30,000 and 50,000 farmers marched to Copenhagen from all parts of the country, presenting their demands on July 28. The government, however, rejected their petition. On August 15 the farmers' executive committee decided to extend the credit given to their British customers from 10 days to three months. The farmers and farm organizations also agreed not to deposit in their banks for remittance to the National Bank sterling remittances received from British customers. The farmers hoped in this way to create a scarcity of sterling in Denmark and thus force their government to lower the exchange rate. As a counter-measure the National Bank raised the bank rate from 2½ to 3½ per cent, although this policy ran counter to the government's policy of fighting the depression through cheap money. The government also declared the "valuta strike" illegal, but the farmers continued their resistance, which seriously hampered the government's economic policy.

When Parliament convened on October 1, Premier Stauning made known his determination to carry the issue to the country. Parliament was dissolved the following day and elections were called for October 22. The result was a decisive government victory. The Social Democrats polled 759,069 votes against 660,782 at the previous election and increased their standing in the Folketing (lower house) from 62 to 68 seats. Their Radical allies retained their 14 seats. The Conservatives, with 293,358 votes, returned 26 deputies; the Liberals, with 292,085 votes, elected 28 deputies (10 less than before). The new extremist farmers' party, splitting from the former Liberal Agrarian party, won five seats with 52,736 votes. The standing of the smaller parties was: Retsforbundet (Justice League), 4 seats; Communists, 27,140 votes, 2 seats; National Socialists, 16,217 votes, no seats; German party, 12,618 votes, 1 seat. As a result of the election, the Social Democratic-Radical ministry was reorganized on November 4 as follows: Prime Minister, Th. A. M. Stauning; Foreign Affairs, Dr. Peter Munch; Finance, H. P. Hansen; Interior, B. Dahlgaard; Justice, M. Steincke; Agriculture, K. M. Bording, all hold-overs. New members were: National Defense, A. Anderson; Social Affairs, L. Christensen; Commerce, K. Jarbol; Public Works, N. Fisker; Education, J. Jorgensen; Religion, J. Hansen. Nine members were Social Democrats and three were Radicals.

Nazi propaganda in Slesvig continued during 1935, despite Danish efforts to prevent it. The German-speaking schools there, although supported by the Danish Government, were reported to have become hotbeds of anti-Danish sentiment. Danish deputies declared in the Folketing that the Slesvig agitation was receiving German financial support and that high officials of the German frontier town of Flensburg were directing the movement for the reincorporation of Slesvig in the Third Reich. Measures of protection against the Nazi threat, backed by a rapidly rearming Germany, were discussed by the Foreign Ministers of Denmark, Norway, and Sweden at their conferences in April and December. The latter meeting was held in Helsinki, Finland, in conjunction with Finnish Socialists. Danish-Swedish relations were further cemented by the marriage on May 24, 1935, of Crown Prince Frederik of Denmark to Princess Ingrid, daughter of the heir to the throne of Sweden. See NORWAY, SWEDEN, FINLAND, and GERMANY under *History*.

DENVER. See WATERWORKS

DENVER, UNIVERSITY OF. A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn quarter of 1935 totaled 2836, while the enrollment in the 1935 summer session was 1458. The faculty had 215 members. The assets consisted of endowment assets of \$2,262,387 and plant assets of \$1,621,518. The income for the year 1934-35 was \$545,114. The library contained 102,177 volumes. The University received the FIDAC award for outstanding work in promoting international understanding. Chancellor, D. Shaw Duncan, Ph.D.

DEPAUW UNIVERSITY. A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church, founded in 1837. The enrollment for the autumn session of 1935 was 1268, including 736 men and 532 women. The faculty numbered 92. The productive funds amounted to \$5,210,000, while the total current income for the year was \$431,-

141.20. The library contained 86,982 volumes. President, G. Bromley Oxnam, D.D.

DETROIT, UNIVERSITY OF. An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers, founded in 1877. In the autumn of 1935 there were 2138 students registered. The summer school registration was 496. The faculty numbered 188. The endowment amounted to \$222,580, while the income in 1934-35 was \$497,696. There were 85,806 volumes in the library. President, the Rev. Albert H. Poetker, S.J., Ph.D.

DEUTERONS. See CHEMISTRY.

DE VRIES, de vrès', HUGO. A Dutch botanist, died at Lunteren, Gelderland, May 21, 1935. Born at Haarlem, Feb. 16, 1848, he was educated at Leyden, Würzburg, and Heidelberg, where he studied botany and chemistry. He first attracted attention in 1869 when he won the gold medal of the University of Groningen with his paper "On the Influence of Heat on the Roots of Plants." After writing more exhaustively on the same subject in the following year he received the doctorate degree at Leyden. At Würzburg in 1871 he came under the influence of the great plant physiologist, Julius Sachs, and as a result devoted the next 10 years to the study of plant physiology. Appointed instructor in natural history in the secondary schools of Amsterdam in that year, he remained until 1875, when he returned to Würzburg. While there he prepared a series of papers on food plants for the Prussian Ministry of Agriculture. Two years later (1877) saw him at Halle, where he was privatdocent, and wrote on "The Mechanical Basis of Cell-Stretching," which became one of his best-known works. He was called to the newly-created University of Amsterdam in that year to become instructor in plant physiology, and subsequently became professor of botany. He retired in 1918 as professor emeritus, to devote himself to his experimental gardens. During 1897-98 he was rector-magnificus, and from 1896 was director of the Amsterdam Botanical Gardens. In 1904 he lectured at the University of California, and his lectures were published under the title *Species and Varieties*.

De Vries became famous by his researches in turgidity and heredity. As to the former, he found that it could be temporarily suspended by the use of salt solutions, the action of which, on the cell, he called *plasmolysis*. Much of his later work on cell growth, and his discovery of the tonoplast, was closely connected with these early researches. His first work on heredity and variability was *Intracellular Pangenesis* (1889). In this he propounded the theory that the nucleus is the bearer of all hereditary characters, active as well as latent. Experimenting with cross-fertilization, he formulated anew Mendel's law of the dissociation of hybrids, and upheld his view that hereditary characters are built up of separate units.

Important as the foregoing scientific contributions were, his greatest aid to science was his work entitled *Die Mutationstheorie* (1901-03). For almost twenty years he experimented with the evening primrose, *Oenothera lamarckiana*, and finally produced the theory of explosive modification, through which new species and varieties arise suddenly, rather than slowly and almost imperceptibly. To this, which differed from Darwin's teaching, he

gave the name of *mutation*. Although not the first to expound this idea, De Vries was the first who performed experiments and worked out a theory to fit the facts which they yielded.

In addition to the works already mentioned, he wrote *Plant Breeding* (Chicago, 1907) and *Gruppenweise Artbildung (The Formation of Species by Groups)* (Berlin, 1913), and numerous papers on plant physiology, heredity, and variability. His scientific writings which appeared in various journals were republished in seven volumes under the title *Opera e periodicis collata* (Utrecht, 1918-27). De Vries also understood the difficult art of popularizing the science of botany, especially in the Netherlands.

DICTIONARIES. See PHILOLOGY, MODERN.

DIELMAN, FREDERICK. An American artist, died at Ridgefield, Conn., Aug. 15, 1935. Born in Hanover, Germany, Dec. 25, 1847, he was brought in infancy to the United States where his family settled in Maryland. In 1864 he graduated from Calvert College, Baltimore, and in 1866 became a topographer with the United States Engineers. Having decided to adopt art as a career, he went to Europe in 1872 to study under Wilhelm Diez at the Royal Academy at Munich. When he returned to New York in 1876, he opened a studio and soon became known for charming, minutely executed *genre* pictures, such as his "Patrician Lady," his first exhibit at the National Academy of Design, and graceful dignified heads against leafy backgrounds. As an etcher, he aided in reviving that neglected art, and also illustrated many books that formed standard editions of well-known writers. During his later years he turned to mural painting, some of his best known work being exhibited at the St. Louis Exposition of 1904. Also, he executed designs for mosaics, notably the mosaic panel, "Thrift" in the Albany Savings Bank; those of History and Law in the Congressional Library, Washington, and six in the Iowa State Capitol, Des Moines, Iowa.

In 1881, he was elected an associate member of the National Academy of Design and two years later became a full member, and at the time of his death was ranking academician. He became the Academy's president in 1899, and held the office for 10 years, resigning in 1910. Under his administration the Academy expanded and its influence increased. From 1910 to 1915 he was president of the Fine Arts Federation of New York, and was one of the founders of the Society of American Artists.

Mr. Dielman became a member of the faculty of the College of the City of New York in 1903, but resigned in 1918, and from 1905 to 1931, he was art director of Cooper Union, teaching both day and evening classes. For two years, 1901-03, he served on the Art Commission of the City of New York.

DINDINGS. See FEDERATED MALAY STATES.

DINWIDDIE, EDWIN COURTLAND. An American minister and temperance advocate, died at Washington, D. C., May 5, 1935. He was born in Springfield, Ohio, on Sept. 29, 1867, and educated at Wittenberg College, from which he received the degree of D.D. in 1922, and at Grove City (Pa.) College, from which he graduated M.A. in 1899. He began his advocacy of the temperance cause while still at school, being elected president of the Ohio Young Men's Prohibition League in 1888, and two years later becoming secretary to the Ohio Prohibition Executive Committee. In 1893 he became legislative superintendent of the

Ohio Anti-Saloon League, serving until 1896. Two years previously, in 1894, he had entered the ministry of the Evangelical Lutheran Church. From 1897 to 1899 he was state superintendent of the Pennsylvania Anti-Saloon League, when he became secretary to the Permanent Committee on Temperance of the General Synod of the Evangelical Lutheran Church, becoming chairman of the committee in 1903 and serving until 1918, when the Evangelical Church merged with the United Lutheran Church. For his temperance work in Ohio he was appointed, in 1899, the first national legislative superintendent of the American Anti-Saloon League and served in this position until 1907, and again from 1911 to 1920.

As one of the leading lobbyists at Washington, Dr. Dinwiddie was successful in his efforts to have passed the Anti-Canteen Act of 1901, prohibiting the Army canteen, and to obtain from Congress grants of almost \$3,000,000 with which to build recreation halls at army posts for the enlisted men. He managed the campaigns of 1906 and 1907 that led to the establishment of statewide constitutional prohibition in Oklahoma, and two years later succeeded in having important legislation regulating interstate shipments of liquor passed. Also, he was the leader of the contest before Congress that resulted in the passage of the Webb-Kenyon interstate liquor shipment bill over the veto of President Taft in 1913. He led the campaign for the national constitutional prohibition amendment before Congress, that resulted in an initial vote of 197 for submission to the States, December, 1914, and he directed the campaign for this amendment that passed the United States Senate and the House of Representatives in 1917.

Dinwiddie was active also in securing legislation for increased equipment and personnel of the Coast Guard, 1926-27; for reorganization of the Prohibition Bureau in 1927; for the Jones-Stalker bill for increased penalties for violating the liquor law, 1929.

In 1893, Dr. Dinwiddie became a member of the International Order of Good Templars, eventually holding important posts in that organization, including national legislative superintendent from 1905; national chief templar from 1922, and international lector from 1927 to 1933. In addition he was a member of several other organizations dealing with temperance, and was a delegate to many conventions and congresses, representing the United States at the International Congresses against Alcoholism in 1909, 1911, 1913, 1921, and 1923.

Dr. Dinwiddie was a frequent contributor to newspapers and magazines on topics relating to temperance and its work.

DISARMAMENT. The committee for the Regulation of the Trade in and the Private and State Manufacture of Arms and Implements of War met at Geneva on Feb. 14, 1935, under the chairmanship of M. de Scavenius, Denmark. It had before it two documents: a draft of a convention on the regulation of the trade in and manufacture of arms, prepared by the committee itself, and draft articles for a convention, submitted to the meeting of the Bureau on Nov. 20, 1934, by the American delegation. The committee considered which of these two drafts should be taken as a basis for its discussion and unanimously agreed that the American Draft was the most suitable, because it followed the lines of the limited convention envisaged by the Bureau of the Conference on Nov. 20, 1934.

As a result of the general discussion; the Com-

mittee accepted a programme of work, proposed by its rapporteur, M. Komarnicki, for the purpose of enabling texts to be drafted rapidly for submission to governments represented at the Conference for the Reduction and Limitation of Armaments.

There was first to be a technical study of the problem of the manufacture of arms and the implements of war. This was to be the work of a sub-committee, consisting of representatives of all the delegations on the committee. The technical sub-committee on categories of arms and implements of war was then to meet to examine the proposed classification. After that, the question of the trade in arms would be taken up by a sub-committee, also consisting of all the delegations. There was then to be another meeting of the full committee to coordinate the work of these various sub-committees.

The committee on miscellaneous provisions of the Conference for the Reduction and Limitation of Armaments met from February 18 to 21 under the Chairmanship of M. Bourquin. On its agenda were two questions: (1) The setting up of a Permanent Disarmament Commission, (2) The transformation of the Disarmament Conference into a Permanent Peace Conference (U.S.S.R. proposal). The committee decided to take first that part of the American delegation's proposal relating to the setting up of a Permanent Disarmament Commission, and to consider Articles 17, 18, 19, 34, 35, 36, and 37, which dealt with the establishment of that Commission and with its general duties. The Committee postponed all that concerned the system of supervision itself to enable the committee for the regulation of the trade in and private and state manufacture of arms to announce its conclusions on the measures of control to be embodied in the draft convention, and it was decided to reserve the Soviet proposal for discussion at a later stage.

The committee for the regulation of the trade in and private and state manufacture of arms and implements of war resumed at the end of March the session which had begun on February 14, but which had been interrupted to allow the work of the sub-committee to continue. It finished its work on April 13 by adopting a report that was to be submitted to the governments represented at the Conference for the Reduction and Limitation of Armaments and to the General Commission of the Conference. The report summarized the proceedings of the committee and its sub-committees and of various committees, such as the committee on general provisions and the technical committee of the national defence expenditure commission, which had participated in its work. The report embodied draft texts representing the result of the discussions. These texts are in no way binding on the governments represented in respect of their final attitude, and they do not preclude a compromise where certain differences of opinion still exist. The committee, nevertheless, observed that material progress had been made towards an agreement and a narrowing down of differences of opinion on vital points, and it expressed the hope "that the future work, the final success of which depends exclusively on the solution of a few questions of principle, may be completed in the near future, especially if the general political situation becomes clearer."

Draft articles of the convention, as presented by the committee, consisted of texts unanimously adopted, texts previously adopted by a majority vote and subject to reservations, and alternative

texts to cover cases in which certain delegations were unable to accept decisions of substance approved by the majority. The articles were accompanied by a commentary, which explained how the texts were drafted or indicated the reservations made by the delegations. The report contained three annexes: (1) Report by a committee of jurists; (2) report by a committee dealing with the question of the transit of arms; (3) opinions of the technical committee of the national defence expenditure commission.

A few weeks before his death, Arthur Henderson, President of the Conference for the Reduction and Limitation of Armaments, completed a "Preliminary Report on the Work of the Conference." It was his intention that this document should serve as a provisional statement on the state of the Conference's work. This preliminary Report was issued to all members of the Conference. It consisted of an introduction and 12 chapters.

The introduction began with an account of the League's preparatory work in regard to disarmament, and then gave an outline of the political conditions at the opening and during the course of the Conference, and enumerated the general and special difficulties with which it was faced.

Chapter 1 refers to the various stages of the Conference. The following chapters dealt with Security, Effectives, Land Material, Naval Material, Air Material, National Defence Expenditure, Chemical, Incendiary, and Bacterial Warfare, the Control of the Manufacture of Arms and the Trade in Arms, Exchange of Information, the Permanent Disarmament Commission, and Moral Disarmament. Each chapter ended with a summary of events and conclusions.

Since the first year of the Disarmament Conference (1932) the United States had maintained a permanent delegation at Geneva, with offices, since 1933, on the Quai Wilson—near the League Secretariat and the Disarmament building. In 1933 Hugh Wilson, United States Minister to Switzerland, came from Bern to Geneva to head the delegation. He was to return to Bern when the Geneva office was closed, and the Geneva force was to be reduced to one man with headquarters in the American Consulate. Mr. Wilson was quoted to the effect that the Geneva office was being closed for economic reasons only, and that it did not indicate that Washington had lost interest in the Conference. It remained obvious, however, according to the Geneva correspondent of the *League of Nations Chronicle*, that the Conference was out of the current picture. Until the nations, including the United States, showed some inclination to stop arming to the teeth, a disarmament conference was a travesty. "Obviously, it is folly to seek disarmament in the present mood of the world. The first thing is to change the mood."

In a statement delivered in the House of Commons on July 19 Stanley Baldwin, then Acting Prime Minister, announced that the British government would proceed at once with a new armament programme calling for construction of 41 air squadrons to be completed before the end of 1938. He made no effort to conceal the fact that this decision had been influenced by the international crisis produced by Germany's rearmament programme and the continued failure of the Disarmament Conference to reach an agreement. While the British programme was described as tentative and subject to revision in the light of future developments, it marked a definite turning

point in British policy which might profoundly affect the international situation.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1935. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Education (College Association); Association for the Promotion of Christian Unity; Pension Board; National Benevolent Association; Board of Church Extension; besides the missionary societies of the States of the U.S., and Provinces of Canada. These agencies are corporations and are related in an advisory way to the International Convention of the Disciples of Christ which meets annually in the late summer or early autumn. The general missionary work of the churches is organized under The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind.

Statistics of the communion show that during the year there were 4540 baptisms in the foreign fields. The 634 mission schools had a total enrollment of 18,182. The communion maintained 14 hospitals and 18 dispensaries which gave 389,437 treatments, a decrease of 27,402 over the previous year. The Church Extension Fund amounted to \$2,913,784. The total church membership throughout the world in 1935 was 1,763,376, a gain over 1934 of 15,400; and in the United States and Canada 1,618,852, a gain of 13,611. The Bible school enrollment for the world was 1,216,607, a loss over the previous year of 7169; and for the United States and Canada, 1,145,432, a loss of 13,009. Contributions, missionary, benevolence, and educational, reported for the fiscal year in the United States and Canada totaled \$1,481,430, a gain of \$69,967.

Among the periodicals published by the communion are *World Call*, *Christian Evangelist*, *Christian Standard*, and *Christian Unity Quarterly*. The president of the International Convention for the year was Dr. D. W. Morehouse, Des Moines, Iowa. Dr. Stephen J. Corey of Indianapolis, Ind., was president of The United Christian Missionary Society.

DODECANESE ISLANDS. See *ÆGEAN ISLANDS, ITALIAN*

DOGS. Two dogs, a big white poodle and an Irish setter, were the headliners in the dog show world in 1935. The poodle, a perfect animal, owned by Mrs. Sherman R. Hoyt, was Nunsoe Duc de la Terrace of Blakeen, winner of best-in-show at the annual Westminster Kennel Club show in February at Madison Square Garden, New York. And the Irish setter was Milson O'Boy, owned by Mrs. Cheever Porter, best at the huge one-day outdoor Morris and Essex show at Madison, N. J., in May. In other years the Westminster winner was considered the leader for the year but the growth of the Morris and Essex show assured the outdoor winner equal greatness with the indoor champion in 1935. There were 2837 dogs benched and 3384 entries at Westminster, and 2827 benched and 3590 entries at Madison.

The year was the 50th anniversary of the American Kennel Club and as such one of the

most successful years in the history of dogs and dog shows. There were several new shows listed and the high marks of each month on the calendar were bettered in the matter of registration.

DOHENEY, EDWARD LAURENCE. An American prospector in oil and industrialist, died at Los Angeles, Calif., Sept. 8, 1935. He was born in Fond du Lac, Wisc., Aug. 10, 1856, and after receiving a high school education left home to seek his fortune. After engaging in various trades, he turned to mining, and for twenty years prospected for gold, first striking metal in Arizona. This led to the opening of the Cave Creek Fields in 1876, and the Wild Rye Creek district a year later. In 1880, he found the Black Range mineral deposits in New Mexico. Subsequently, an accident broke both his legs, and while convalescing he studied law, being admitted to the New Mexico bar. He practiced for about a year, but the lure of prospecting called him and he turned from the legal profession.

While in Los Angeles in 1892 he noticed a wagon loaded with a black tarry substance. Asking what it was, he was told that it was "brear," the Mexican term for pitch. He immediately set out for Westlake Park where it had been obtained. Knowing that "brear" was oil-soaked earth, he reasoned that if the surface were oily, oil must be below. At that time he was without funds, but meeting a friend, Charles Canfield, the two of them managed to obtain enough money to begin operations and leased a vacant lot near the Park. Neither of them knew anything of drilling for oil, so they began to "mine" for it as they had mined gold. They sank a shaft about 150 ft., and as a result secured enough money to go farther. When they had gone down about 225 ft., the oil gushed forth and the oil boom of Los Angeles was on.

The competition became keen and Dohenev looked for new oil fields. He again went prospecting and located the oil fields at Fullerton, Calif., in 1897, and those at Kern River Valley, two years after. Seeking still further, he and Canfield went south to Mexico, and in the Tampico district found the oil deposits that were to bring them fame and fortune. They leased about 450,000 acres in their neighborhood and along the Tamesi River, and formed the Mexican Petroleum Co. in 1900. In March of the following year the first well was built on Cerro de la Pez, and in May it was opened and operations were begun that were to make Mexico the second largest producer of oil in the world. In 1905 and 1906, the Huasteca district was acquired and was formed into the Huasteca Petroleum Company, which in 1925 controlled 1,550,000 acres of Mexico's oil lands. In 1911, the Dohenev interests acquired the Caolric Company, which distributed petroleum throughout South America, and in 1913, the Petroleum Carriers, Ltd., was formed to control the transportation of petroleum in Europe. To distribute the Mexican oil, the Mexican Petroleum Corporation was formed in 1915, and later the Mexican Petroleum Corporation of Louisiana was also organized. In 1916, the Pan American Petroleum Company of California was begun, which controls about 30,000 acres of producing oil land in California, and in 1919, a corporation owned by the Dohenev interests and British capital was formed under the name of the British Mexican Control Company. All these firms were controlled by or were subsidiaries of the Mexican Petroleum Co., Ltd., of Delaware, organized in 1907, and the development of the parent company started by Dohenev. The Pan American Petroleum

and Transport Company, which controlled the Pan American Petroleum Company of California, was also founded in 1916, and in 1924, the steamship fleet, oil lands, and development properties of this corporation were valued at \$155,603,276.

During the Senate investigation of the oil scandals of the Harding administration in 1924, Dohenev was accused of offering a bribe of \$100,000 to Albert B. Fall, Secretary of the Interior, in order to obtain preferential treatment in the giving out of government oil leases, especially that of the Elk Hills naval oil reserves. During the almost endless litigation, Dohenev contended that the money was given merely as a loan from one old friend to another. In February, 1924, the oil leases received by Dohenev were canceled, and in the following June, Fall and Dohenev were indicted for conspiracy in the Elk Hills leases, and Fall for accepting and Dohenev for giving a bribe. In November, 1926, they went on trial on the first charge and in December were acquitted. In 1927 the U.S. Supreme Court found that the Elk Hills and other oil leases were full of fraud and corruption, and two years later Fall was convicted of accepting a bribe and sentenced to a year in prison and a fine of \$100,000. In March, 1930, Dohenev went on trial for giving a bribe and later in the month was acquitted. In 1932 the Government dropped the last conspiracy indictments against him and the criminal cases resulting from the oil scandals were ended.

Dohenev early espoused the cause of Irish freedom and contributed liberally to it, and in 1920 was president of the newly-formed American Association for the Recognition of the Irish Republic. During the World War he placed his fleet of oil ships at the disposal of the government and purchased millions of dollars of Liberty bonds. His active and varied career was one to capture the imagination, and through his death, one of the last of the empire builders passed away.

DOLE, NATHAN HASKELL. An American editor, author, and translator; died in New York, May 9, 1935. Born in Chelsea, Mass., Aug. 31, 1852, he was graduated from Harvard in 1874. After teaching in Massachusetts for several years he went to Philadelphia to become art and music editor of the *Press* in 1881. Six years later he became associated in an advisory capacity with T. Y. Crowell & Co., of Boston, and in 1901 joined D. Appleton & Co., in New York, as secretary of the Publicity Department, retiring a few months later to devote his time to his literary activities.

The first book to bear his name was *A Young Folks' History of Russia*, published in 1881, and this was followed by a score of books, as well as translations of the works of Tolstoi, Daudet, Valdes, and Verga. He was an enthusiastic "Omarist," and for many years was the president of the Omar Khayyám Society. He edited several editions of the *Rubáiyát*, and 1899 published *Omar the Tentmaker, A Romance of Old Persia*. In addition, Mr. Dole wrote many lyrics suitable for Russian musical accompaniment, and with Thomas Bailey Aldrich edited *The Young Folks' Library*. Also he was the editor of *The Greek Poets, The Latin Poets, Breviary Treasures*, the 10th edition of Bartlett's *Quotations*, and of the Glossary of foreign words and phrases appended to Roget's *Thesaurus*. For a time he edited *The Westminster Review* of Atlanta, Ga.

Mr. Dole served as president of the Bibliophile Society from 1901 to 1912, and was a member of

the Poetry Society, and of the advisory council of the Simplified Spelling Board.

His published works, in addition to those mentioned above, included: *A Score of Famous Composers* (1891, under title *Famous Composers*, 2 vols., 1902; revised and enlarged, 1924, 1928); *Not Angels Quite* (1893); *On the Point* (1895); *The Hawthorn Tree, and Other Poems* (1895); *Poems*, for the Educational Music Course (1896); *Life of Francis William Bird* (1897); *Joseph Jefferson at Home* (1898); *Peace and Progress—The Building of the Organ and Onward* (poems, 1904, 1906); *Six Italian Essays* (1907); *The Pilgrims and Other Poems* (1911); *Alaska* (1909); *Life of Count Tolstoi* (1911); *The Spell of Switzerland* (1913); *Rote Songs for the Boston Public Schools* (1915-16); *America in Spitzbergen* (2 vols., 1922). He also edited *The Mistakes We Make* (1898); *Flowers from Persian Poets*, with Belle M. Walker (1901); *Marat's Polish Letters* (1905); *Vocations*, with William deWitt Hyde and Caroline Ticknor (10 vols., 1909-10); *Poems of Dr. Samuel S. Curry*, with Biography (1923); and *Best Humor of 1926*, with Harold S. Dole.

DOMESTIC RELATIONS. See LAW.

DOMINICA. See LEEWARD ISLANDS, BRITISH.
DOMINICAN REPUBLIC (SANTO DOMINGO). A West Indian republic, occupying the eastern part of the island of Hispaniola (Haiti). Capital, Santo Domingo.

Area and Population. The republic has an area of 19,332 square miles and the population at the census of May 13, 1935 was 1,478,121 (894,385 at the 1920 census). The 1935 census populations of the chief cities were: Santo Domingo, 71,297 (94,207 including the suburbs and adjacent region comprising the National District); Santiago, 33,919; San Pedro de Macoris, 18,889; Puerto Plata, 11,777; La Romana, 10,935; San Francisco de Macoris, 10,305. About 40 per cent of the population is white (mainly of Spanish descent), 40 per cent mestizo, and 20 per cent Negro. The official as well as the vernacular language is Spanish. Roman Catholics comprise 97 per cent of the population. In 1933 there were 698 primary schools, with 68,011 pupils; 30 technical schools, with 2298 pupils; and the University in Santo Domingo, with 340 students.

Production. An agricultural country, the Dominican Republic is primarily dependent upon the sugar crop. The sugar harvest for the year ended Aug. 31, 1935, totaled 475,057 short tons (428,309 in 1933-34). American companies operate most of the 21 sugar centrals. The 1935 cacao crop was about 54,000,000 lb. The tobacco crop of about 80,000 bales (of 110 lb. each) was abnormally small. Coffee exports in 1933 totaled 11,794 tons. Livestock in 1935 included 701,008 cattle, 284,189 horses, and 284,052 goats. Sugar refining is the chief manufacturing industry. The forests produce lignum-vitæ, mahogany, and dyewoods.

Foreign Trade. Imports in 1934 were valued at \$10,574,000 (\$9,323,000 in 1933) and exports at \$12,895,000 (\$9,625,000 in 1933). The United States in 1934 furnished 58 per cent of the total imports; Japan, 7.5 per cent; United Kingdom, 7 per cent. Of the 1934 exports, the United States, including Puerto Rico, took 23.4 per cent; United Kingdom, 21 per cent; France, 18.5; Canada, 9.9. Raw sugar, coffee, cacao, molasses, tobacco, and hides and skins are the principal exports.

Exports in 1935 from Dominican ports totaled \$15,530,975. Exports to the United States were valued at \$4,982,872 (\$3,784,939 in 1934) and im-

ports from the United States at \$4,517,553 (\$5,819,915 in 1934).

Finance. Budget estimates for 1935 placed revenues at 9,289,280 pesos and expenditures at 9,276,528 pesos, the anticipated surplus being 12,752 pesos. Gross collections by the Dominican Customs Receivership during 1934 totaled \$3,189,200 (\$2,999,577 in 1933), of which \$2,692,429 was turned over to the Dominican Government. Internal revenue taxes in 1934, exclusive of customs duties, amounted to \$2,040,973 (\$1,689,454 in 1933). Total government revenues in 1934 were reported at \$9,439,000 and total expenditures at \$8,985,000.

The foreign debt as of Dec. 31, 1934, was reported at 16,292,500 pesos (16,320,500 pesos on Dec. 31, 1933). There are no recent data concerning the amount of the internal debt. The peso was equivalent to one U.S. gold dollar.

Communications. The public works programme inaugurated by the Trujillo régime was continued actively during 1935. The following new highways were completed: San Francisco de Macoris-Salcedo, Rincon-Cotuy, Santiago de los Caballeros-Janico. A new bridge over the Nizao River on the main road between Haiti and the Dominican Republic was completed. Improvement of the port of Santo Domingo so as to permit entrance of the largest ocean-going vessels was approaching completion at a cost of \$2,500,000. Vessels entering all Dominican ports in 1933 numbered 1332, of 1,900,856 tons; vessels cleared, 1293, with 1,884,645 tons. Radio-telephone service between Santo Domingo and the United States was inaugurated on Oct. 31, 1935. There are two small railways, with 147 miles of line; about 700 miles of first-class highways; and air connections with most of the American countries through Santo Domingo. In 1934 872 air passengers arrived in the Dominican Republic from foreign ports and 918 departed.

Government. The Constitution of June 20, 1929, revised on June 9, 1934, vests executive power in a President, elected for four years by direct vote. Congress consists of a Senate of 13 members (one from each of 12 provinces) and a Chamber of 35 deputies, all elected by direct popular vote for four years. President in 1935, Gen. Rafael Leonidas Trujillo Molina, who was reelected unopposed for a second term on May 16, 1934. A National District, embracing Santo Domingo and its vicinity, was established on Jan. 1, 1935, with a representation of one Senator and two Deputies in Congress. President Trujillo's Dominican party was the only political organization permitted in the republic.

History. Writing in *Current History Magazine* for June, 1935, Hubert Herring described political conditions in the Dominican Republic under President Trujillo as follows: "The press is muzzled; there is no freedom of speech; men are afraid to talk even in the privacy of their homes. Spies are everywhere. Trujillo has recruited his own band of secret police. Political murders increase, while hundreds who dared to criticize have fled the country."

Adherents of President Trujillo, on the other hand, pointed to his numerous tangible achievements. The budget was balanced, interest payments on the foreign debt were continued throughout the depression, and the service of the foreign debt was reduced through the agreement of Aug. 16, 1934, with the Foreign Bondholders' Protective Council and the United States State Department. Order was maintained by a small, efficient army of some

3000 men. An extensive programme of public works was carried out without resort to new foreign loans. Government lands were distributed to poor farmers. Other reported activities of the government were the construction of schools and reorganization of the educational system, a campaign against malaria and other diseases, establishment of model farms for the teaching of agriculture, repeal of the property tax and the imposition of other taxes designed to encourage national industries, etc. Another achievement to Trujillo's credit was the settlement of the 91-year-old boundary dispute with Haiti, announced in a joint statement issued Feb. 27, 1935, by the Presidents of the two republics. (For the terms of settlement, see the *Bulletin of the Pan American Union*, May, 1935, p. 370-371.)

With a strict censorship prevailing within the country, it was difficult to determine the truth of assertions that hundreds of Trujillo's opponents had been murdered, imprisoned, or had mysteriously disappeared. Some evidences of iron-handed dictatorship came to light during the year, however. On April 25 four Dominican citizens fleeing from the country on board the SS *Borinquen* were forcibly removed from the ship after it had sailed from Santo Domingo. On April 28 an assassin, believed to have been one of Trujillo's secret agents, attempted to murder Dr Angel Morales, leading opponent of the Trujillo Government, in New York City, where he had taken refuge. Dr. Morales, who was formerly Dominican Minister to Washington, was absent from his apartment and escaped injury, but his secretary, Sergio Bencomse, was mortally wounded.

Early the same month, Trujillo's police announced the arrest in Santo Domingo of Amadeo Barletta, Italian consul and prominent business man, on charges of conspiring to assassinate the President. Barletta's friends asserted that this charge was trumped up to force him to cease manufacturing cigarettes in competition with a company allegedly controlled by Trujillo. Barletta was finally freed on May 22 on the insistence of Mussolini. In March foreign business men in the republic were threatened with deportation and domestic merchants with correspondingly severe penalties if they raised prices following the imposition of new taxes by the government. A tax of 10 per cent on remittances to foreign countries was decreed, ostensibly to prevent the "flight of capital," but the meaning of the decree was so uncertain that the banks were compelled to cease selling foreign exchange.

On June 13 the Dominican Legation in Washington, D. C., announced that President Trujillo had invited all Dominicans residing abroad to return at national expense "without any exception and regardless of the reason which caused their departure from the country." On June 29 the Dominican Government gave specific promises that the leading Dominican political exiles in the United States would have their estates restored to them if they returned. Later in the year President Trujillo announced his intention of paying a visit to the United States.

In accordance with the laws of Sept. 5 and Oct. 16, 1934, the National District was inaugurated on Jan. 1, 1935. An independent political and judicial entity, it comprised all but five sections of the former commune of Santo Domingo.

DOUGHTON DEBT LIMITING ACT.
See UNITED STATES under Congress.

DRAMA. United States. In New York the very first week of January introduced two of the season's outstanding offerings, both highly successful, continuing with unabated popularity into the Summer or later. One was Robert E. Sherwood's *The Petrified Forest*, a melodrama of Arizona bandits, philosophy and renunciation made especially memorable by the acting and presence of Leslie Howard in its chief rôle with exceptionally competent assistance from Peggy Conklin, Humphrey Bogart, and Charles Dow Clark. The other, arriving on the same date, was *The Old Maid*, a drama fashioned by Zoe Akins from Edith Wharton's novel, one of her series of pictures of life in old New York. Starting under the handicap of rather faint praise from even some of the more discerning critics on the ground that it was a reversion to a superannuated and over-sentimental type, it nevertheless grew in favor and approval to the point of ultimately being awarded, despite the customary mild controversy, the Pulitzer Prize for 1934-35. The acting honors were divided mainly between Helen Menken in the title part and Judith Anderson in a rôle of equal prominence, with George Nash and Margaret Dale also contributing ingratiating performances. The appearance of this pair of hits was followed a week or so later by two more of comparable popularity in J. B. Priestley's *Laburnum Grove*, a novel, amusing and mildly baffling mystery play wherein the author disregarded with impunity the ancient law of dramatic construction which held that the audience, at least, must not be left in doubt of the final outcome, and for which Edmund Gwenn, who had become pleasantly identified with the piece, written primarily for him, in London, was transported to repeat his success in America, aided by Melville Cooper, Elisabeth Risdon, and Molly Pearson; and a harum-scarum comedy by Dorothy Bennett and Irving White entitled *Fly Away Home* involving the unpremeditated reunion of a divorced couple whose four unconventional and amazing children, lacking paternal discipline for a dozen years, are found to be sadly in need thereof. With these came a malodorous and exotic piece by Noel Coward, *Point Valaine*, deservedly unsuccessful notwithstanding the fact that it provided Alfred Lunt, Lynn Fontanne, Osgood Perkins, and Louis Hayward with rôles demanding exceptional acting ability which they handled with admirable skill.

For the first time in its career the Theatre Guild sponsored a production not its own by importing from London, in association with the British impresario, Charles B. Cochran, the German actress, Elisabeth Bergner, playing in English in Margaret Kennedy's *Escape Me Never*, a continuation of her saga of the eccentric Sanger family but lacking the merits of *The Constant Nymph*. Interest in Fraulein Bergner's individual and highly resourceful performance, as well as in those of Hugh Sinclair and Leon Quartermaine, far transcended the play itself. January, however, closed with a fifth decided hit, an hilarious, though sometimes unmannerly, farce by John Cecil Holm and George Abbott called *Three Men on a Horse*, whose run carried well over into the ensuing year. In this instance chief acting glory went to William Lynn for his portrayal of a mild-mannered, plodding commercial rhymester who, by virtue of his uncanny yet disinterested flair for picking winners, finds himself suddenly pitchforked into the maelstrom of race-track gambling, while Sam Levene was almost intolerably realistic as a high-pressure tout.

Fortune smiled less often on February, which

delivered but little that proved durable. Among the short-lived ventures were two adaptations of modern Spanish dramas, *Field of Ermine*, translated by John Garrett Underhill from the original of Jacinto Benavente, and *Bitter Oleander*, wherein José A. Weissman performed a similar office for Federico Garcia Lorca. France also contributed a delightful but transient item in André Obey's *Noah*, a fantasy cleverly adapted into English by Arthur Wilmurt, with musical obbligate by Lois Horst. In the title rôle Pierre Fresnay, the French actor who had come to America a few months previously to appear with Yvonne Printemps in Noel Coward's *Conversation Piece*, gave a capital imaginative portrait of the Biblical character, and the spirit of the offering was happily captured by the cast as a whole. The long-contemplated revival of *Rain*, for which Tallulah Bankhead had so often been urged as the logical successor of the late Jeanne Eagels in the part of Sadie Thompson, took place as planned but without causing more than the mildest flurry. The Moscow Art Players (not to be confused with the famous Moscow Art Theatre) were visitors for six or seven weeks with a repertoire of Russian classics and modern Soviet pieces, among them Gogol's *Revisor* as perhaps the most favored item. Bernard Shaw, as represented by the Theatre Guild's production of his newest fantasy, *The Simpleton of the Unexpected Isles*, found his public waning even as his facility for turning out real drama seems to wane, and this despite the presence in the cast of Nazimova, Lawrence Grossmith, Romney Brent, and Rex O'Malley, along with other competent players. But February did introduce a new playwright in Clifford Odets, an associate of the Group Theatre, whose *Awake and Sing*, presented by that organization, disclosed him as an ardent sympathizer with the proletariat and possessor of strongly radical tendencies. In the following month two other pieces by the same author, *Till the Day I Die* and *Waiting for Lefty*, each in one act but numerous scenes, were staged, and served to confirm the earlier impression of Mr Odets as an earnest and vigorous, if not inspired, dramatist, particularly the last-named, which concerned itself with a recent taxicab strike. Reasonable success also attended Frederick Jackson's *The Bishop Misbehaves*, an entertaining mystery comedy in which Walter Connolly had the pleasant opportunity of disporting himself as a highly reverend gentleman with a long suppressed leaning toward amateur detective work. The piece subsequently found great favor among the Summer theatres. But not even the exceptionally fine work of such players as Robert Loraine, Cecilia Loftus, the late Moffat Johnston, Elena Miramova, Fania Marinoff, Eric Wollencott, and Owen Davis, Jr., was able to keep Louis Bromfield's adaptation of Edouard Bourdet's *Les Temps Difficiles* afloat for more than a month. The English version bore the title *Times Have Changed*. Marc Connelly's *The Green Pastures* returned to New York for a final engagement, early in the course of which Richard B. Harrison, the devout Negro actor who had played the rôle of "The Lawd" more than 1600 times without missing a single performance, was stricken and died, his place being thereafter taken by Charles Winter Wood, his understudy.

Early March brought *Petticoat Fever*, by Mark Reed, in which Dennis King, who had hitherto divided his talents between musical comedy and romantic drama, disclosed further versatility by evincing an equal facility for light farce, in which

he was amusingly assisted by Leo G. Carroll and Doris Dalton. This, however, proved to be almost the last notably successful offering of the so-called Spring season, although a tragic melodrama of aviation, Frank Wead's *Ceiling Zero*, continued from mid-April into the Summer with Osgood Perkins in its principal rôle. The few productions of this period which, without scoring hits, nevertheless deserve a place in the record, were John van Druten's *Flowers of the Forest*, presented by Katharine Cornell and her company; *Kind Lady*, an especially gripping crook play fashioned by Edward Chodorov from a Hugh Walpole story, which had the advantage of exceptionally fine performances by Grace George and Henry Daniell; a comedy by E. M. Delafield, the novelist, entitled *To See Ourselves*, with Patricia Collinge; *If a Body*, a mystery drama by Edward Knoblock and George Rosener; and a piece called *Something Gay*, by Adelaide Heilbron, which occupied the time of Tallulah Bankhead, Hugh Sinclair, and others for a number of weeks. *Recruits*, a comedy with music, offered by the Jewish Workers' Art Theatre, meanwhile drew a considerable following, and the season's low mark was registered by something named *Reprise* with but a single performance. The Theatre Guild met disaster in the form of a "satirical revue" known as *Parade*, and The Players Club brought the season to a semi-official close with its week's revival of *Seven Keys to Baldpate*, the highly successful mystery comedy adapted by George M. Cohan more than 20 years previously from Earl Derr Biggers' then popular novel. In the brief resuscitation Mr. Cohan himself appeared in the rôle taken in the original run by the late Wallace Eddinger. As usual the cast bristled with names of well-known players.

During the vacation season there was the customary activity among the summer resort theatres throughout the country, divided more or less evenly between stock presentations of recent successes and try-out productions of new pieces hopeful of later metropolitan careers. Few, however, of these hopes had been realized by the close of the year.

The fall season, despite various fitful and ill-fated attempts, succeeded only after mid-September in getting positively under way, the occasion then being the appearance of Beatrice Lillie, accompanied by a galaxy of lesser lights, in a revue, *At Home Abroad*, by Howard Dietz and Arthur Schwarz, which promptly established itself as a decisive hit. Oddly enough, thereafter, two of its predecessors which had earlier experienced difficult sledding, took root and were still current when the year expired. One was an unpretentious comedy entitled *Moon Over Mulberry Street*, the other a mystery melodrama, *Night of January 16*, whose chief claim to fame lay in the novelty of having its all-important trial jury selected from the audience present at each performance and of leaving the choice of two available endings to the decision of that jury. Another early offering of more limited drawing power was *A Touch of Brimstone* with the normally agreeable Roland Young playing an extremely disagreeable character, and Mary Phillips figuring sympathetically as his long-suffering wife. The Theatre Guild made an unfortunate start with a theoretical and political drama by the militant-pacifist Rev. Dr. John Haynes Holmes and Reginald Lawrence, *If This Be Treason*. Success was also denied to a dramatization by Sidney Howard of Humphrey Cobb's too realistic war novel, *Paths of Glory*. But again two other plays that had

opened under uncertain auspices managed eventually to establish themselves as durable attractions if not actual hits. These were *Blind Alley*, a crime melodrama with a psychoanalytical slant, by James Warwick and with Roy Hargrave and George Coulouris for its protagonists, and *Remember the Day*, Philo Higley and Philip Dunning's tender comedy of adolescent love which was given the benefit of an ingratiating performance of its central boy rôle by young Frank M. Thomas, Jr.

The outstanding artistic achievement of the Fall was unquestionably Maxwell Anderson's poetic tragedy of injustice and the underworld, *Winter-set*, in which Burgess Meredith, Richard Bennett, and a young actress known to the stage simply as Margo acquitted themselves with distinction and for which Jo Mielziner designed one setting in particular conveying the atmosphere of a Whistler nocturne. By early October something like a record had been established for the modern theatre with three productions of Shakespeare. In two of them—*Othello* and *Macbeth*—the gifted English players, Philip Merivale and Gladys Cooper, were starred with Kenneth MacKenna and Alexandra Carlisle as their chief support. But they were soon forced to the conclusion that their public preferred them in the modern drama. The other was the Theatre Guild's second presentation of the season, Alfred Lunt and Lynn Fontanne's idea of *The Taming of the Shrew*, first shown by them to "the road" in the Spring. Their rowdy and boisterous conception of the work, with circus features, appealed strongly to, presumably, playgoers who had never seen the piece done as high comedy instead of riotous farce, and scored a pronounced hit. A soviet-style farce-comedy, *Squaring the Circle*, adapted by Eugene Lyons and Charles Malamuth from a popular Russian piece by Valentine Katayev, also lasted over into 1936. But a new play by the uneven British dramatist, John van Druten, *Most of the Game*, proved completely disappointing to American audiences.

For its third offering the Theatre Guild did the unusual in bringing out an operatic version of one of its own earlier triumphs, *Porgy*, DuBose and Dorothy Heyward's picturesque folk drama of the Charleston Negro originally produced in 1927. It was found to lend itself admirably to an effective score by George Gershwin with lyrics partly by his brother Ira, partly by Mr. Heyward himself. Rechristened *Porgy and Bess*, with nearly all parts capably acted and sung by Negroes, including Todd Duncan and Anne Brown in the title rôles, this too developed into a substantial hit. Its appearance was followed two days later by an even more pronounced success in *Jubilee*, a satirical musical comedy de luxe with book by Moss Hart, tunes by Cole Porter, in which, at the close of the year, the brilliant cast headed by Mary Boland and including also Melville Cooper, Charles Walters, Margaret Adams, Derek Williams, June Knight, Mark Plant, and May Boley as principals seemed destined to disport themselves throughout the season, at least. Yet other works by well-known playwrights were meanwhile faring pretty badly—among them Philip Barry's *Bright Star*, which was tempting fate again after a similar experience out of town a year earlier; Martin Flavin's allegory, *Achilles Had a Heel*, which Walter Hampden esteemed highly enough to produce; and *Eden End*, by J. B. Priestley. Slightly better fortune, however, attended a so-called melodramatic farce, *Crime Marches On*, in which Bertrand Robinson and Maxwell Hawkins amusingly ridiculed such

institutions as radio advertising and the Pulitzer Prizes, and which was performed with suitable spirit by young Elisha Cook, Jr., Charles D. Brown, and Will Rogers' charming daughter, Mary; also a somewhat baffling work on the Pirandello order, B. M. Kaye's *On Stage*, wherein the question was raised as to what might happen to a playwright if by chance the characters he had created refused to act in the manner prescribed for them and decided to take matters into their own hands. Osgood Perkins argued the point for the playwright and Selena Royle, Donald Macdonald, Claudia Morgan, and Frederic Worlock were among the recalcitrant creatures of his imagination. *Mulatto*, an uncommonly sincere and restrained work on the subject of racial injustice, written by a Negro, Langston Hughes, with that highly gifted colored actress, Rose McClendon, in its cast, succeeded probably beyond all expectations by continuing over from late October into the new year.

From this point until, and including, the holidays the number of deserving hits, if not quite equal to the casualties, was at least great enough to give to the first half of the new season a distinction that had been missing from the theatre for several years. Among the outstanding contributors thereto was a production by Norman Bel Geddes of *Dead End*, written by Sidney Kingsley, whose *Men in White* had captured the Pulitzer Prize a year or so previously. The later work sketched in vivid fashion the life history of a gangster and was further notable for the realistic novelty of its setting. Another was a dramatization by Helen Jerome of Jane Austen's delightful early 19th century novel, *Pride and Prejudice*, enlisting the talents of a notable cast that included Adrienne Allen, Colin Keith-Johnston, Lucile Watson, Helen Chandler, Percy Warham, Brenda Forbes, and Viola Roache. Next in order came *Parnell*, a romantic and reasonably authentic biographical drama dealing with the climax of the career of the great Irish patriot of that name and the chivalrous circumstances of his downfall—a work from the pen of a new playwright, Mrs. Elsie Schaffer, who died while rehearsals were under way. The English actor, George Curzon, came to America to enact the title rôle, but greater glamour attended the performance of Margaret Rawlings, also from London, as the lovely Kitty O'Shea. Effie Shannon, Edward J. MacNamara, John Emery, and Barry Macollum lent abundant additional credit to the occasion. Then, after many postponements, came *Jumbo*, the magnitudinous offering of Billy Rose, for which the huge old Hippodrome was reconditioned into the semblance of a vast one-ring circus tent and which comprised most of the familiar and essential circus features tied together by a comparatively gratuitous musical comedy plot dashed off by Ben Hecht and Charles MacArthur. Prominently involved in these festival proceedings were Paul Whiteman (with band), Jimmy Durante, Arthur Sinclair, A. P. Kaye, W. J. McCarthy, Donald Novis, Gloria Grafton, "Poodles" Hanneford, Bob Lawrence (for his voice), one A. Robins, a remarkable clown, and even several veteran performers from the days of Barnum & Bailey; also a genuine menagerie.

Two items which, though not greeted with success, nevertheless are entitled to a place in the record, were *Night in the House*, a gruesome importation from London, where it was known as *The Old Ladies*, adapted by Rodney Ackland from Hugh Walpole's story of that name and skilfully played by a cast that consisted almost entirely of Nance

O'Neil, Josephine Hull, and Mildred Natwick; and *How Beautiful with Shoes*, a praiseworthy but inept attempt, on the part of Wilbur Daniel Steele and Anthony Brown, to achieve something idyllic, toward which the acting of Marie Brown, Myron McCormick, Harry Bellaver, and Ralph Riggs contributed considerably. The Group Theatre, which, as previously recorded, had gone proletarian in the Spring at the instance of one of its own playwright members, Clifford Odets, found almost no enthusiasm at all for its first Autumnal offering, *Weep for the Virgins*, which was virtually forgotten by mid-December, and not a great deal for its second, *Paradise Lost*, another Odets work, which could hardly be said to fulfil the promise of his earlier pieces. A much more important drama of the radical order, Albert Bein's *Let Freedom Ring*, adapted from Grace Lumpkin's book, *To Make My Bread*, after a brief career under the managerial wing of its author, was taken over by the Theatre Union and remained current beyond the end of the year. As had happened once back in May, another production in the Fall, *Satellite* by name, went straight to the storehouse at the close of its first performance. With December came Eva Le Gallienne, no longer as standard-bearer of any Civic Repertory organization but as a stellar attraction with a repertory of three bills, the only one of which that was new for her being Ibsen's decidedly dated *Rosmersholm*.

The balance of the chronicle, in so far as New York is concerned, deals with practically nothing but hits—of varying proportions, to be sure, but deeply enough rooted to carry them over, mostly well over, into 1936. Chronologically the list is headed by *First Lady*, a scintillating comedy by Katharine Dayton and George S. Kaufman imputing to the feminine portion of the inner political circles of the Nation's capital extraordinary sway but few scruples in the matter of the making or breaking of candidacies for even the highest office. Jane Cowl was the bright particular star of the occasion with Lily Cahill as her foil in a battle royal of the ladies, with Stanley Ridges, Oswald Yorke, Ethel Wilson, Jessie Busley, and Thomas Findlay among those lined up on one side or the other. Next followed *Boy Meets Girl*, an hilarious picture by Bella and Samuel Spewack of goings-on among the busier purveyors of scripts to the talking picture trade in Hollywood, supposedly inspired by a certain two in real life, that depended for the success which was its lot solely upon its own fun and speed and appropriate acting by players with hitherto comparatively unfamiliar names—in particular Jerome Cowan, Allyn Joslin, and Joyce Arling. Then *May Wine*, a musical piece of uncommon type by Sigmund Romberg, Oscar Hammerstein 2d, and Frank Mandel, differing from the familiar formula in that it boasted an unusually insistent plot offset by a complete, or nearly complete, lack of chorus features. Several of the Romberg airs were especially pleasing and the important rôles were capably handled by Walter Slezak, Nancy McCord, Walter Woolf (King), Robert C. Fischer, and Leo G. Carroll.

Mme. Alla Nazimova, long famous for her portrayals of the Ibsen heroines, appeared for the first time as Mrs. Alving in an admirable production of *Ghosts*, with exceptionally capable assistance from Harry Ellerbe and McKay Morris. Another welcome London importation was *Libel*, by Edward Woolf, a singularly gripping English courtroom drama involving an ingeniously contrived case of questioned identity, finely acted by Colin Clive,

Wilfrid Lawson, Ernest Lawford, Frederick Leicester, Joan Marion and other members of a cast distinctively British. Katharine Cornell brought back to New York for its second Holiday engagement her notable presentation of *Romeo and Juliet*, differing from that of a year earlier only in the persons of the Romeo, Mercutio, and Nurse, played by Maurice Evans, Ralph Richardson, and Florence Reed respectively. Christmas night disclosed one more edition, not startlingly novel in any important respect, of George White's *Scandals* with Rudy Vallee, Willie and Eugene Howard, and Bert Lahr heading its roster of entertainers. Then, on the evening after Christmas, the year virtually ended for the Theatre with the offering of an abbreviation of Laurence Housman's drama-form biography of England's longest-reigning queen, *Victoria Regna*, distinguished especially for the remarkable skill displayed by Helen Hayes in compassing credibly a full 60 years of the life and career of that doughty sovereign. Excellent support was contributed by Vincent Price in the rôle of Albert, Prince Consort. The actual final presentation of the year, *Tomorrow's a Holiday*, though obviously too new for its chances to be positively gauged, involved a plot so weighted down with age as to seem unlikely to survive the transfusions administered by two Viennese playwrights and the American Romney Brent.

Great Britain. The post-Holiday season in London was slow to start, but January saw at least one hit, *Love on the Dolce*, a thoughtful and impressive work by Ronald Gow and Walter Greenwood, introducing a promising new actress in Wendy Hiller. This ran throughout the year. Another production with an even longer record of success (dating actually from late in 1934) was a modern adaptation of an old Chinese classic, *Lady Precious Stream*, done into English by Dr. S. I. Hsiung and staged in the characteristic Oriental manner with Occidental players. Norman Ginsbury figured as author of *Viceroy Sarah*, an historical item concerned with the famous Duchess of Marlborough who was so important a figure in the reign of Queen Anne. The veteran Irene Vanbrugh portrayed the doughty lady. An unusually credible piece on the topic of amnesia was adapted by Dion Titheradge from a French original and played by Leslie Banks as *Man of Yesterday*. A courtroom drama, offered by Matheson Lang, commenced its career as *For the Defence* but was presently renamed *There Go All of Us*. John Hastings Turner was its author.

One of the risks of attempting to uproot a performer steeped in the traditions of his own métier and transplant him into an entirely different one was exemplified when a management more daring than judicious turned London's famous music hall comic, George Robey, loose on the rôle of Falstaff in Shakespeare's *King Henry IV, Part 1*. J. B. Priestley's *Cornelius* was hailed as his best play, though it failed to become his most popular. Even New York's record for a full week was surpassed in London in late March by one that brought 13 premières. Among them was Cosmo Hamilton and Anthony Gibbs' *The Aunt of England*, a Victorian comedy whose special distinction was the presence of Haidee Wright as a Dowager Duchess. John Gielgud, as producer, offered Rodney Ackland's dramatization of Hugh Walpole's story, *The Old Ladies*, a grim but arresting tale of a desolate lodging house with four women as the only characters. April brought a new Charlot revue, *Char-a-bang*, as well as another pronounced

success in Robert E. Sherwood's Anglicized version of Jacques Deval's entertaining picture of exiled Russian nobility reduced to the status of domestic servants in a French bourgeois household, *Tovarich*, in which Sir Cedric Hardwicke and Eugenie Leontovich figured with distinction. Reginald Arkell's *1066* and *All That* proved to be a rollicking burlesque of English history; *The Flying Trapeze*, a very appealing spectacle of the Paris of 1860 with music partly at least by Ralph Benatzky, and with Jack Buchanan as the central figure; *Roulette*, by Harry Graham from Laszlo Fodor's Hungarian original, notable mainly for the work of the versatile Margaret Rawlings in a secondary rôle. Seymour Hicks came forth in his own dramatization of *The Miracle Man*, the Frank L. Packard novel that George M. Cohan cut to stage measure for America more than 20 years ago. May witnessed a particularly heart-warming occasion in the Golden Jubilee testimonial tendered by the London stage to Marie Tempest, the incomparable.

June disclosed undiminished activity, an outstanding presentation being an exceptionally ingenious murder play by, and with, Emyln Williams, entitled *Night Must Fall*. Dame May Whitty was also conspicuous in its cast. Merton Hodge's *Grief Goes Over* achieved little beyond providing an effective character for Dame Sybil Thorndike. London took the English version of André Obey's *Noah* straight to its heart with John Gielgud in the title rôle.

Summer brought the usual Drama Festival at Malvern, with Shaw's *Simpleton* of the *Unexpected Isles* as its chief novelty. There, as earlier in the year in New York, the author was caustically criticized for his arrogant disregard of the basic laws of dramatic structure. September introduced *The House of Borgia*, by Clifford Bax, a work disappointingly lacking in the requisite color but remarkable for the fact that the beautiful Lucrezia of that name was portrayed, after considerable research on Mr. Bax's part, not as the usual she-devil but as a person of admirable character. Bruno Frank's *Nina* introduced another German refugee, Lucie Mannheim, as an actress of more than ordinary talent. William Devlin, the young actor who in the preceding year had distinguished himself at the age of 22 by an admirable performance of King Lear, gained fresh renown for his work in the title part of Ibsen's *Peer Gynt* in a new translation by R. Ellis Roberts.

The closing three months of the year saw, probably, as many new productions of note as all the others combined. In October James Parish's *Distinguished Gathering* had an experimental tryout in a suburban theatre, whereby it was found to be an unusual and skilfully contrived tale of murder, in some respects of similar type to Sir James Barrie's *Shall We Join the Ladies?* A more regular presentation soon followed. James Bridie's shrewdly humorous work, *The Black Eye*, furnished excellent opportunities for Stephen Haggard and Jean Cadell. *Espionage*, by Walter Hackett, was found both interesting and ingenious. And then came John Gielgud's admirable staging of *Romeo and Juliet* in which, at first, the actor-manager acted the Mercutio, Laurence Olivier the Romeo, Peggy Ashcroft the Juliet, and Edith Evans the Nurse. Under this arrangement the two ladies received the greater acclaim. Subsequently, but according to the original plan, Mr. Gielgud and Mr. Olivier exchanged rôles to good advantage. Robert Morley's *Short Story* gave delightful oc-

cupation to so distinguished a trio as Marie Tempest, A. E. Matthews, and Ursula Jeans. *Murder Gang* was found an authentic as well as militantly indignant and scathing picture of conditions as its author, George Munro, a London crime reporter, knew them. Basil Dean collaborated with him in giving suitable form to his dramatic protest. Ernest Milton tried his hand at Shakespeare's rarely offered *Timon of Athens*. *Not for Children*, with which its American author, Elmer Rice, had long threatened New York, was found upon its special British experimental première to be a much-involved satirical fantasy.

France. In Paris, although, with a few notable exceptions, the usual active coterie of playwrights were busily engaged in turning out new works, their product was singularly lacking in distinction as well as in durability. As a result there was frequent recourse to the drama of other nations, such as a new work by Pirandello, *Ce Soir On Improvise*, one more phase of his characteristic topic of stage illusion; an adaptation by Alexandre Arnoux of the Spanish Calderon's 17th Century *El Medico de Sa Honra*; and Maurice Maeterlinck's symbolic though disappointing *Princesse Isabelle*. Of the native dramatists, François Porche contributed a comedy of the court of Louis XIV, *Un Roi*; *Deux Dames et un Valet*, Maurice Rostand a deliberately sensational item on the trial of Oscar Wilde; Jacques Bousquet the book of an amusingly anachronistic musical picture of ancient Rome, *Les Joies du Capitole*, with lyrics and score by Albert Willemetz and Raoul Moretti respectively. Jean Sarment was represented by *Madame Quinze*, an attempt to whitewash the reputation of Louis XV; René Benjamin by the fantastic and sprightly *Grouette*; and a new playwright, Loic Le Gouriadec, entered the ranks with *Une Jeune Fille A Révé*. Louis Verneuil figured as co-author with Georges Berr of *L'Homme au Foulard Bleu*, a modernized version of their own *Guignol*, and also as author of both *Vive le Roi* and *Les Fontaines Lumineuses*. But the most important contribution to the first half of the year was Stève Passeur's *Je Vivrai un Grande Amour*, a work notable for the exaltation exemplified in its central character.

During the Summer a version of the Passion Play met with extraordinary popular enthusiasm as presented out of doors before the Cathedral of Notre Dame. In early Fall Sacha Guitry disclosed two new works, neither of which measured up to his standards—one a philosophy of middle-aged love and temperament entitled *Quand Jouons-Nous la Comédie?* the other, in which he personally appeared, *La Fin du Monde*.

Germany. In Germany the Nazi-imposed restrictions on drama continued to exert a strangling influence upon the impetus toward original work, and to confine the scattered theatrical representations largely to revivals of national and other classics, with an occasional new operetta of the Viennese type, such as *Die Vielgeliebte*, with book by Rudolf Koller and music by Nico Dostal, a disciple of the school of Strauss and Lehár. In Hamburg during the Summer Hannsgeorg Lauenthal, a young actor of 22, distinguished himself in the title rôle of Schiller's *Don Karlos*.

Other Countries. Spain, especially Madrid, seized the occasion to memorialize the tercentenary of the death of her most famous and prolific dramatist, Lope de Vega, with a series of productions of his works, mainly in modernized adaptations. Throughout the Soviet Union there was evidence

of a consistent growth of interest in the theatre, which was fostered by the establishment of an increasing number of traveling stages and troupes, as well as subsidized stationary playhouses.

A similar condition existed in Sweden under the impetus of the aid contributed by the State. The traveling theatres operated over a circuit of some 70 cities and towns on a subscription basis twice as extensive as that of the preceding year. It was not at all uncommon for patrons to journey as far as 60 miles to attend a production. Repertories were broad and international in scope, including works of Shakespeare, Sheridan, Tolstoy, Eugene O'Neill and, of course, Strindberg; also operas by Puccini, Rossini, etc. The operetta type was found especially popular north of the Arctic Circle. This healthy activity was doubtless a main inspiration for a number of new dramas by native playwrights—Ragnar Josephson, Per Lagerkvist, and Sigurd Siwertz.

In Dublin the famous Abbey Theatre organization underwent a transition period, torn by problems and an insistent demand for a broader policy and scope than heretofore. A six-year breach with Sean O'Casey, which had started with the rejection by the Abbey company of his *The Silver Tassie* on religious grounds, was finally healed by placing the work in rehearsal. Nevertheless its appearance was the signal for an outburst of indignation and controversy on the part of the Abbey's regular patrons. As part of the widening scope certain of the plays of Bernard Shaw were added to the repertory, which commenced to assume an international aspect. A comparable, though less broad, policy also went into effect at the Gate Theatre.

DREYFUS, ALFRED. A French artillery officer, died at Paris on July 12, 1935. He was born at Mulhausen in Upper Alsace, Oct. 9, 1859, and when the residents of Alsace-Lorraine were forced to declare their nationality, as a result of the treaty of Frankfurt in 1872, the Dreyfus family, with the exception of one son past military age, remained French and went to Paris to settle. At the age of 19, Alfred started his military training at the École Polytechnique, and two years later passed to the École d'Application, being commissioned a lieutenant in 1882, and ordered to the 31st Artillery Regiment at Le Mans. He was promoted to captain in 1889 and sent to the École Centrale de Pyrotechnie Militaire at Bruges to study ballistics. A year later he entered the École Supérieure de Guerre, graduating in 1892 with high honors, which led him to be appointed to the General Staff, the first Jewish officer to receive such an assignment.

Without any warning or any indication of what was to occur, Captain Dreyfus was arrested on Oct. 15, 1894, at the office of the Chief of the General Staff on a charge of treason. A letter, known thereafter as the "bordereau" and claimed to have been stolen from the German Embassy on August 16, was the basis of the charge. The letter dealt with the offer of certain documents of military importance to the German Government and was couched in terms that would hardly have been used by an artillery expert. Also it closed with the remark, "I am just off to the manoeuvres," which that year were not attended by the probationers, of which Captain Dreyfus was one.

Nevertheless, chiefly on the evidence of Alphonse Bertillon, who testified that the handwriting of the "bordereau" resembled that of Dreyfus, he was brought to the headquarters of the General

Staff and under pretext was asked by Major Du Paty de Clam to write a letter which proved to be identical with the "bordereau," the Major believing that he would give himself away when confronted with this evidence. Dreyfus remained calm, however, and Du Paty, finishing the experiment, arrested him for treason, and he was removed to the military prison of Cherche Midi. Although strongly protesting his innocence, he was kept *incommunicado* until December 5, when he was allowed to receive legal advice and write to his family. His trial, which began on December 19, lasted four days and was held in secret. After the judges had retired to consider the verdict, the Minister of War, Gen. Auguste Mercier, laid before them eight documents and a letter covering them. Only one of these related to Dreyfus, but because of the covering letter, all incriminated him. The document that had reference to him was decoded and had it been decoded correctly would have proved his innocence. By not admitting these papers to the defense, the judges violated Article 101 of the Code of Military Procedure. Dreyfus was found guilty of having delivered "to a certain foreign power or its agents, a certain number of secret or confidential documents concerning the national defense," and sentenced to public degradation and life imprisonment. The degradation was carried out on Jan. 5, 1895, on the parade ground of the École Militaire, Paris, when his insignia were ripped from his uniform and his sword broken.

On March 15, he arrived at the penal colony at Cayenne, French Guiana, until the prison at Devil's Island, of the Isles du Salut, could be made ready for him. Incessant heat and rain for five months of the year was the climate of the island that was to be his prison. In September, 1886, it was reported that he had escaped and, to prevent the actuality, the Government ordered him kept in strict seclusion.

During the time of his incarceration, his family had been making every effort to prove his innocence and to have the case reopened. Through the keenness of a stock broker (who was shown the "bordereau," and recognized the handwriting as that of a customer, one Maj. Walsin Esterhazy, an impecunious and ne'er-do-well member of an illustrious Hungarian family) and the interest and strong-mindedness of Lieut.-Col. Georges Picquart, head of the Military Intelligence (who in going over other papers recognized the handwriting of Esterhazy to be that of the "bordereau") as well as the interest of Senator Scheurer-Kestner, the case was again brought before the public. On Nov. 15, 1897, Mathieu Dreyfus published an open letter to General Billot, who had succeeded General Mercier at the War Office, denouncing Major Esterhazy as the criminal and repeating his brother's innocence. On January 10-11, 1898, Esterhazy was court-martialed, but threatening to involve his superior officers, was unanimously acquitted. Then Colonel Picquart was arrested and imprisoned on the charge of giving out information received in official documents.

On Jan. 13, 1898, there appeared in *L'Aurore*, then edited by Georges Clemenceau, a letter entitled "J'accuse" by Émile Zola in which he denounced the condemning of an innocent man and the freeing of a guilty one. The War Ministry, alarmed at the turn of events, went before the Chamber of Deputies with a "dossier" of secret charges to prove Dreyfus's guilt. Colonel Picquart denounced them as forgeries, naming Lieu-

tenant-Colonel Henry as the forger. The latter confessed and was arrested, but before he was brought up for trial committed suicide.

The case now assumed the proportions of a *cause célèbre* and a national scandal, and it was referred to the Supreme Court for review. This Court, after hearing all the evidence, ordered the findings of the court-martial of 1894 abrogated and a new trial. Dreyfus was returned to France and put on trial at Rennes on Aug. 7, 1899. In view of the Court of Cassation's action, the public was amazed when he was again found guilty by a vote of five to two. President Loubet pardoned him, but Dreyfus wanted complete vindication, so for seven long years the agitation dragged on. Again the Supreme Court entered the case and finally annulled all previous proceedings and proclaimed Dreyfus innocent. Bills were introduced into the Chamber of Deputies for the restoration of Dreyfus and of Colonel Picquart, who had sacrificed his career by his stand, to the military positions they would have won had they never been persecuted. On July 12, 1906, Dreyfus was created a knight of the Legion of Honor. He was reinstated in the army as a Major, and assigned to an Artillery regiment at Vincennes. After serving for two years he retired into the reserves. During the World War he was brevetted a brigadier-general and put in command of one of the forts of Paris. At the close of the War he was made commander of the Legion of Honor. Dreyfus then retired to private life.

In 1908, while attending ceremonies in honor of Zola at the Pantheon, he was slightly wounded in the arm by an anti-Semitic fanatic. In 1930, he was a member of a committee of French intellectuals which drew up a petition interceding on behalf of Sacco and Vanzetti and forwarded to Massachusetts officials.

The Dreyfus affair grew through a wave of anti-Semitism that swept over France and the desire to avoid a military scandal, and the outcome was hailed as a great triumph over militarism in France.

DROUGHT, THE. See AGRICULTURE; LIVESTOCK; DUST STORMS.

DUANE, WILLIAM. An American physicist, died at Devon, Pa., Mar. 7, 1935. Born at Philadelphia, Feb. 17, 1872, he was graduated from the University of Pennsylvania in 1892. As holder of the Tyndall fellowship he studied at the Universities of Berlin and Göttingen, receiving the degree of Ph.D. at Berlin in 1897, his thesis being published by the Imperial German Government. On his return to the United States in 1898, he accepted the post of professor of physics at the University of Colorado, holding it until 1907, when he was invited to join Pierre and Marie Curie in their Radium Research Laboratory in Paris. He remained with them for five years, returning to the United States in 1913 to become assistant professor in and fellow of the cancer commission at Harvard University. In 1917, the chair of biophysics at the University was created for him. He retired in 1934 because of ill health.

At the Collis P. Huntington Memorial Hospital, supported by the commission for the study of malignant diseases at Harvard, Dr. Duane was supervisor of the use of radium and X-rays, and as such, devoted considerable research to developing a new type of X-ray for the treatment of cancer, as well as aiding in the development of the methods of using radium and the X-ray. He designed machinery used in hospitals for the preparation of

the radioactive substances and originated important methods of using them. To him can be credited the generating machine used in the treatment of cancer, for it was largely through his efforts that it came into use. It is a machine of high power with relatively heavy output of short wave-length rays and with steady rather than fluctuating voltage. Dr. Duane also made many important researches in the field of physics, especially in relation to biological phenomena and electricity. His chief scientific contributions relate to the structure of matter and the mechanics of radiation, particularly to the so-called quantum relations.

For his researches in connection with X-ray and radio-activity, Dr. Duane was awarded the John Scott medal and premium (\$800) in 1922; the National Academy of Sciences' Comstock Prize of \$1500 in 1923, and in the same year, the first Leonard Prize of \$500 by the American Roentgen Ray Society. He was a member of several scientific organizations, including the American Society for Cancer Research, of which he was president in 1923-24, and had contributed many articles on the subject of his researches to technical journals.

DUISBERG, dūs'bōrk, CARL. A German chemist and industrialist, died at Leverkusen, Germany, Mar. 19, 1935. He was born at Barmen, Germany, Sept. 29, 1861, and educated at the Oberrealschule at Elberfeld, and from 1879 to 1884 studied at the universities of Göttingen, Jena, Munich, and Strasbourg. His thesis for the doctor's degree at Jena attracted attention and led to his becoming an assistant in the university's chemical laboratory. For a time he worked with Prof. Hans von Pechmann at Munich, where he discovered benzopurpurin and benzozurin. He gave up his scholastic career to enter the chemical laboratories of Fried. Bayer & Co., at Elberfeld in 1888, and out of his small laboratory grew the vast chemical works of I. G. Farbenindustrie A-G. In addition to red dyes, which dyed wool without having first to be steeped in caustic, he discovered various other pharmaceutical products that added greatly to the fame and prestige of his firm.

From the beginning of the 20th century, he advocated the establishment of a comprehensive chemical trust to do away with wasteful and destructive competition. In 1904, the first step in this direction was taken when Badische Anilin-und-Sodafabrik Farbenfabrik vorm. Fried. Bayer & Co. and the A.-G. für Anilinfarben-Fabrikation entered into a community of interests. He was made managing director in 1912, and in 1915, under the stress of War conditions, saw his dream finally realized when five other chemical firms joined, forming the I. G. Farbenindustrie (Community of Interests) of the German Coal Tar Industry. Ten years later the firms merged into one single organization, the I. G. Farbenindustrie A-G., of which Duisberg was appointed chairman of the board. This organization controlled 80 per cent of the world's chemical production and had a capital of 1,000,000,000 marks. It made many experiments with poison gases and artificial rubber, and discovered a new anæsthetic called *averin*, which from 1930 was used in place of ether. In 1926, together with representatives of British and German industries, Duisberg established an "economic Locarno," and took part in several conferences concerning an industrial "entente."

At the 8th International Congress of Applied Chemistry held in Washington in 1912, Duisberg lectured and exhibited a tire made of synthetic rubber, but said that the making of such rubber

for general consumption had not yet been achieved. He was the recipient of many honors throughout the course of his career, and in 1904 was made a Professor by the State. He was awarded the Bunsen gold medal, being one of the few men ever to receive it, and the W. Hoffman silver medal.

As a great industrial leader, he wielded great power in post-War Germany, and although an active supporter of the new Republic, he opposed government control of industry and warned against short-term credits. He firmly believed in the reduction of German war debts and felt that this would serve as a stimulus to trade throughout the world, thereby alleviating financial distress. His interest in scholarship was great and he founded academic associations for the assistance of the universities and the students. He gained worldwide achievement for his qualities of organizer, scholar, economist, and inventor. His unusual talents made him undisputed leader of German industry, having succeeded in creating an enterprise which established the reputation of German dyes throughout the world.

DUKAS, du'ka', PAUL. A French composer, died in Paris, May 17, 1935, where he was born on Oct. 1, 1865. He was educated at the Lycée Charlemagne and at the Paris Conservatory studying under Mathias, Th. Dubois, and Ernest Guiraud. In 1888 he was awarded the second Prix de Rome for his cantata *Velleda*. Having to perform his military service, his studies were interrupted for a year, and it was not until 1892, when his overture to *Polyeucte* was performed at one of the Lamoureux concerts, that his music came into prominence. His musical interpretation of Racine's tragedy met with approval despite the popularity of Wagner at that time.

In 1896, he composed a symphony in C major and followed it with his best known work, *The Sorcerer's Apprentice*, written in scherzo form and strikingly original. This he conducted himself at the Société Nationale de Musique in 1897, and it was played in May, 1899, at the London Musical Festival. He was regarded as one of the leaders of the French school, second perhaps only to Debussy, whose admirer he was. In 1921 he wrote *La plainte au loin du faune* and dedicated it to the master. His works also include a symphony and two overtures, *King Lear* and *Gott von Berlichingen*. His opera, *Ariane et Barbe bleu*, based on Maeterlinck's fantasy, was first performed in Paris in 1907 and scored a great success. It was heard in Austria in 1908; Italy, 1909; and the United States, at the Metropolitan Opera House in New York, in 1911.

In 1909, Dukas was appointed to the Conservatory, teaching orchestration for three years, and in 1926 he was appointed professor of composition at the École Normale de Musique in Paris, two years later being made director of the Paris Conservatory. He also wrote the ballet, *La Peri*, produced in Paris in 1911 with the Russian danseuse Trouhanova, and the ballet, *Fantaisie chorégraphique* in 1928. Together with Saint-Saëns he completed and orchestrated Guiraud's opera, *Fredegonde* (Paris, 1905). His appreciation of and interest in the great harpsichord composers led him to edit a number of the works of Rameau, Couperin, and Scarlatti.

Not only was he a successful composer but he was a capable music critic as well, and contributed articles on music to *La Revue Hebdomadaire* and the *Courrier Musical*. Of his work, a French critic has written that it shows "an unquenchable thirst

for rhythm. . . . Though modern, his music escapes the unrest of our day. There is none more serene, in spite of its prodigious life."

DUKE UNIVERSITY. An institution of higher education in Durham, N. C., which, having its origin as York Academy in 1838, was expanded in 1858 into Trinity College and in 1924, through benefactions from James B. Duke, into Duke University. The enrollment for the autumn of 1935 was 3214. The faculty numbered 337. The endowment funds amounted to approximately \$30,000,000. The library contained approximately 420,000 volumes. President, William Preston Few, Ph.D., LL.D., Litt.D.

DUST STORMS. The transportation of top soil by the wind has been a somewhat common phenomenon in the Great Plains States ever since the beginning of cultivation there by the white man. Naturally, this phenomenon is more frequent in relatively dry years than in wet ones. While these dust storms of the past had always caused inconvenience, especially to housewives, it was seldom, if ever, that serious property damage resulted from them until the year 1933. Of course, droughts always cause damage, varying from slight to severe, to growing plants; hence during dry weather the agricultural interests always suffer. Moreover, in long continued droughts, towns and cities may have to incur unusual expense to maintain their water supply. But before dust storms can take place, there must be strong winds in addition to the dry weather, and for this soil blowing itself to cause damage, it must be on a large scale. The damage from dust storms during 1934 was greater than that of 1933, while that in 1935 far exceeded either of the previous two years.

The dust storms were the result of three contributing factors: first, the prolonged dry weather with many consecutive months of little or even scanty rainfall; secondly, unusually high winds; lastly, cultivation which even while the crops are in their most vigorous growth leaves the soil with relatively weak roots to bind its particles together as compared with the strong root growth of the virgin sod, while during the preparation of the soil for crops there are no roots at all and the bare soil is completely exposed to the wind. When there are no growing crops a reasonable supply of moisture is sufficient to prevent the wind from blowing the soil, but with dry weather there is invariably some blowing of soil which is not covered with plants. With prolonged dry weather, even growing crops sometimes wither and die thus leaving the soil exposed to the wind.

That portion of the United States which suffered most during 1935 from the loss of soil as the result of wind was in southwestern Kansas, southeastern Colorado, northeastern New Mexico and the adjacent portions of Oklahoma and Texas. While this region was the one most affected, neighboring portions of these States as well as parts of Wyoming, Nebraska, and North and South Dakota also suffered from soil erosion by wind. The soil removed from these districts was carried by the wind to all parts of the United States east of the Rocky Mountains. However, along the Atlantic seaboard the transported dust was never quite so noticeable during 1935 as in May, 1934 (see THE NEW INTERNATIONAL YEARBOOK, 1934, the article on METEOROLOGY).

The extent to which these dust storms affected places not in the regions from which soil was re-

moved by the wind is exemplified by the conditions at Topeka, Kans., on March 20. Here the visibility was less than 300 yards during the middle of the day; the sun was entirely obscured by dust, and artificial light was necessary for reading. Dust covered sidewalks and streets, and on the following morning pedestrians and vehicles left tracks almost as plain as if in newly fallen snow.

Dust storms occurred during each of the first five months of 1935; they were least severe during January and May. During March, beyond any reasonable doubt, dust storms were more numerous and more severe than in any previous month in the recorded history of the United States. Those of April were more numerous and severe than those of March. The great frequency with which dust storms were observed is borne out by the case of Texas. During March there were only three days when dust blowing was not observed somewhere in that state, while during April there were only two.

The effects of the dust storms were exceedingly varied. In many fields the soil was blown away to the depth of as much as one foot; in these cases it will be impossible to cultivate the soil for several years. In other cases the top soil was blown away only to the depth of a few inches; and in even less severe cases, reseeded crops was all that was necessary in order for the farmers to get crops during the year. Cherry orchards in the rich agricultural section between Fort Collins and Loveland, Colorado, suffered severely when the freshly plowed soil was swept away leaving roots of the trees bare.

Many pastures were so covered with dust as to render them unfit for grazing. Where the dust was not quite so deeply deposited on the pastures, the livestock suffered greatly from eating so much dust with their feed; many cattle died from this cause. The same trouble resulted from dust that drifted into haystacks, and in some sections dead stock lying along roads was a common sight. Livestock also died from suffocation. One of the worst dust storms took place in southwestern Kansas on April 14; on this day it became so dark that chickens went to roost before three o'clock in the afternoon.

Drifts were very common. In many places the drifted dust was 6 feet deep. A few drifts 9 feet in depth were reported in New Mexico. This drifting of the dust delayed traffic of all kinds. Not only was traffic delayed by drifting, but also as a result of reduced visibility and other causes. The railroads engaged in a spectacular fight against the "black blizzard," and succeeded in maintaining service to a more satisfactory extent than any other form of transportation. Despite the frequent low visibility and great difficulty of keeping the tracks free from drifts, there were no serious accidents, although delays were somewhat numerous and equipment (particularly locomotives) suffered severely. The new air-conditioned passenger cars functioned quite satisfactorily. On the worst days of dust storms most automobilists used headlights in the middle of the day. Other automobilists were unable to get their cars started because the ignition system was rendered useless by the static electricity which accompanied the worst storms; many motorists were thus left temporarily stranded. The static electricity, generated by friction among the dust particles in the air, was at times so intense that electrical shocks were received when one came in contact with any metal part of a car. Even where the dust was not greatly pronounced, the

cylinder walls of engines in automobiles driven through dust storms were badly damaged and in some instances a new engine was necessary. Aviators reported dust at altitudes as high as 20,000 feet.

Suffering and discomfort from these dust storms were intense. Schools were closed temporarily in many localities as a measure of safety, and many ranch homes were deserted by their tenants. Artificial light was used during mid-day. In some of the worst storms it was necessary to breathe through wet cloths or towels. Some residents hung wet blankets over their doors and windows. In some localities dust settled in buildings of all kinds; floors and furniture were covered with a thick film of powdery dust. Many persons were lost within 100 yards of their homes during the very worst storms, on account of the greatly reduced visibility. A dust storm which occurred over a large part of Kansas on March 15 was unusually severe at Alton, Kans.; during much of that night the street lights could not be seen from across the street.

The persistence of fine dust particles in the air had a detrimental effect on health, and on the morale of those who were forced to live and work in the continually dust laden atmosphere. The death rate from pneumonia and other respiratory diseases increased markedly. The Red Cross volunteer workers made dust masks by the thousands and distributed them to persons in the affected areas. Emergency hospitals for the treatment of dust victims were established.

EARTHQUAKES. Estimates as to the actual number of earthquakes which are felt in some part of the world during each year differ widely, partly because seismological observatories are not regularly distributed over the earth's surface. A. Sieberg has estimated that 9000 earthquakes take place each year and his estimate is considered reliable by many seismologists. Fortunately the vast majority of quakes are either feeble and harmless, or else occur under the sea or in thinly populated regions. However, C. Davison has estimated that in an average year 14,000 persons are killed by earthquakes. Heavy quakes often occur in remote regions and are known to have happened only from the records made by seismographs over the globe, even in some populated regions direct news is sometimes weeks or months in reaching the rest of the world. In the United States alone, more than 200 earthquakes are usually reported annually.

On April 21 the most destructive of recorded earthquakes in Formosa took place in the northwest part of that island. About 3200 persons were killed and 9000 injured; also about 19,000 houses were destroyed, and others damaged. The epicentre was in the upper reaches of the Koryuki River, 25 miles northeast of Taichu. The area of greatest damage was 50 miles long and 25 miles wide, running from Taichu to the outskirts of Taihoku and parallel to the west coast. This shock occurred in a district where earthquakes have been infrequent during the present century. The principal earthquake zones of Formosa are those of Kagi in the central part and Karenko and Giran on the east coast. To the Kagi centre belonged the earth-

quake of 1906, the last great quake in Formosa and, except for the recent (Taichu) quake, the most destructive one in the history of Formosa.

On May 31 an earthquake took place in Baluchistan which almost destroyed the cities of Quetta, Mastung, and Kalat. The epicentral area of this quake was roughly parallel to the main structural lines of the eastern part of Baluchistan, which run from SSW to NNE; the zone of destruction was about 130 miles long and 20 miles wide at its greatest width.

This region of Baluchistan is one that is frequently disturbed by earthquakes. Destructive earthquakes occurred there in 1892, 1909, and 1931. The quake of 1892 damaged an area parallel to and about 45 miles to the west of the recent (Quetta) earthquake and was associated with a prominent fault known as the great boundary fault; that of 1931 damaged an area parallel to and about 50 miles to the east of the recent earthquake.

The destruction of Quetta was almost complete. Landmarks of all kinds disappeared and the city was left a widespread mass of debris. An official report gave the number of killed in Quetta as 26,000 out of a population of 40,000. In addition to the towns of Quetta, Kalat, and Mastung, at least 100 villages were totally destroyed, and the number killed in them was estimated at 12,000. The total number of deaths was probably about 40,000. So impossible was it to excavate the dead bodies in Quetta that all the survivors were removed in fear of outbreak of disease and the city surrounded by barbed wire entanglements and guarded to protect the property of survivors from marauding tribesmen.

Strangely enough, the recent quake was not a severe one. Although there was great loss of life, road and rail communications were not damaged; trees, lampposts, and most telegraph poles remained standing and in areas of excessive damage to native buildings the few buildings that were earthquake proof remained intact, not even their chimneys falling.

The great loss of life and destruction of property was not at all due to the intensity of the earthquake but rather to the poor quality of the buildings, the construction of earthquake-proof houses having been generally neglected. Quetta lies in an upland valley, 5500 feet above sea level and, owing to small rainfall, houses in the villages of this valley are built of unbaked bricks with mud mortar, a proper mortar rarely being used. In the towns, bricks or limestone blocks are used for the better buildings, but even here mud mortar is used.

Other destructive earthquakes, but less remarkable than the ones above described, occurred as follows. On January 4 at Istanbul and other places near the Sea of Marmara, Turkey, in which 40 persons were killed; on April 11 in northern Persia where 480 persons were killed; on May 1 near Kars on the Turco-Russian border where 600 deaths resulted; two near Tovildolinsky in the republic of Tajikistan (U.S.S.R.) near the Afghanistan border, one October 11 and another six days later, which killed 150 persons; and the ones at Helena, Montana, during October. See MONTANA.

The quakes of October 11 and 18 at Helena were rated 7 and 8 respectively on the modified Mercalli intensity scale. In comparison, the last disturbance of appreciable strength in this region, which occurred July 27, 1925, was of intensity 8. During the week between these two shocks a dozen or more of intensity 4 to 5 occurred and probably 200 of intensity 3 or less. The heaviest shock (Oc-

tober 18) caused but little damage to well constructed buildings. In general buildings stood up remarkably well; modern brick and stone residences suffered little loss. Much damage was done to an old school building and to commercial buildings that lacked steel or concrete frames; many of these buildings were of poor construction. About 100 brick and stone residences of old and poor construction were made uninhabitable. No damage was done to gas or water lines, but telegraph, telephone, and electric light service were interrupted about an hour. There was no loss from fire. Two deaths occurred and the property loss was estimated at \$2,000,000. Public order was easily maintained. See SEISMOLOGY.

EASTERN LOCARNO. See FRANCE, GERMANY, ITALY, UNION OF SOVIET SOCIALIST REPUBLICS, POLAND, CZECHOSLOVAKIA, LITHUANIA, LATVIA, and ESTONIA under *History*.

EAST PRUSSIA. A province of the German State of Prussia from which it is geographically separated by the Polish Corridor. Area, 15,061 sq. miles; population (June 16, 1933), 2,333,301.

ECOLOGY. See BOTANY; ZOÖLOGY.

ECONOMIC ASSOCIATION, AMERICAN. An organization founded at Saratoga, N. Y., in 1885 to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life, to issue publications on economic subjects, and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership in 1935 totaled approximately 3700. The annual meeting of the association was held in New York, N. Y., Dec. 26-28, 1935. Among the topics discussed were "Recovery, 1933-35: Distinguishing Characteristics"; "The Problem of Rigid vs. Flexible Prices"; "A Fifty-year Perspective in Economic History"; "Capital Formation"; "Problems of an Integrated System of Unemployment Relief"; "Prospects for International Trade in American Farm Products"; "America's Power to Produce and Consume"; "Equivalents for Value Theory in a Collectivist Economy"; "Effect of New Deal Legislation on Industrial Relations." The official journal is the *American Economic Review*, a quarterly. The officers in 1935 were: President, John Maurice Clark, Columbia University; vice presidents, Frank H. Knight, University of Chicago, and Willard L. Thorp, Washington, D. C.; counsel, John E. Walker, Washington, D. C.; and secretary and treasurer, Frederick S. Deibler, Northwestern University.

ECONOMICS. See BANKS and BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; LITERATURE, ENGLISH and AMERICAN; PUBLIC FINANCE.

ECUADOR. A South American republic. Capital, Quito.

Area and Population. Due to the fact that the frontier with Peru is not definitely settled, the area is variously estimated at from 275,936 to 337,304 square miles, including the Galapagos Islands in the Pacific (3028 square miles). No exact census has ever been taken. The estimated 1934 population was about 2,600,000. Approximate populations of the principal cities in 1933 were: Quito, 107,192; Guayaquil, 126,717; Cuenca, 43,542; Riobamba, 22,427. Whites comprise about 10 per cent of the population; Indians, 39 per cent; mixed, 41 per cent; Negroes and others, 10 per cent. Living births in 1933 numbered 103,525; deaths, 58,175; marriages, 14,270.

Education. Elementary education is nominally free and compulsory, but large masses of the population are illiterate. In 1934 there were 2336 primary schools, with 172,046 pupils; 21 secondary schools, with 3663 pupils; and four universities (at Quito, Guayaquil, Cuenca, and Loja).

Production. While agriculture supports about 90 per cent of the population, mining is important from an export standpoint. About 11,480,000 acres are under cultivation. Cacao, the chief money crop, has suffered from the witchbroom blight. Cacao exports in 1934 totaled 19,031 metric tons (10,580 in 1933). Other leading crops were coffee (exports, 31,582,368 lb. in 1934), rice (production, 68,445,000 lb. in 1934), bananas (1,452,231 bunches exported in 1934), oranges, sugar (production, 20,000 metric tons in 1934), tobacco, and other fruits. The forests yield ivory nuts, hat straw, rubber, kapok, and cinchona bark. Wool production in 1934 was 700 metric tons.

The chief mineral products in 1934 were: Petroleum, 235,000 metric tons (230,000 in 1933); gold (exports), 17,964 kilograms of cyanide precipitates; silver (exports), 533 kilograms. Manufacturing industries in 1934 had an invested capital of 51,092,000 sucres, an output valued at 61,288,000 sucres, and 9050 workers. The leading industries, by value of output in 1934, were textiles, shoes and leather, breweries, tobacco products, petroleum refining, and sugar refining.

Foreign Trade. Excluding bullion and specie, imports in 1934 totaled 61,773,000 sucres (31,862,000 in 1933) and exports were 102,471,000 sucres (44,282,000 in 1933). Of the 1934 imports the United States supplied 32.8 per cent by value (31.6 per cent in 1933); Japan, 14.1 (3.2); Great Britain, 13.0 (16.8); Germany, 11.5 (14.3). The United States purchased 41.8 per cent of the 1934 exports (49.3 in 1933); France, 20.6 (13.8); and Japan, 0.6 per cent (0.4). The principal 1934 exports by value were: Cacao, 27,165,459 sucres; coffee, 20,656,004 sucres; gold ore, 18,905,566 sucres; crude petroleum, 12,901,987 sucres; ivory nuts, 4,871,504 sucres. Cotton textiles, foodstuffs, metals and manufactures, and chemicals were the chief imports.

In 1935 imports totaled 97,094,000 sucres; exports, 113,498,000 sucres. Exports to the United States were valued at \$3,265,832 (\$3,098,648 in 1934) and imports from the United States, \$2,842,962 (\$2,342,613).

Finance. Total government revenues in the calendar year 1934 were 46,575,000 sucres (41,842,000 in 1933), while expenditures were 43,588,000 sucres (41,842,329 in 1933). For 1935 the budget estimates placed government receipts at 63,500,000 sucres and expenditures at 63,600,000 sucres, excluding extraordinary credits of 2,100,000 sucres.

On Jan. 2, 1934, Ecuador's total foreign debt, including interest in arrears, was reported at \$25,749,425, the internal debt was 34,671,910 sucres (\$3,175,947), and the floating debt was estimated at 938,279 sucres (\$85,946). Service of the foreign debt was suspended in April, 1931. The gold standard was abandoned Feb. 9, 1932. The average exchange rate for dollar sight drafts during 1934 was 10.94 sucres. The par value of the sucre was \$0.20.

Communications. Ecuador in 1934 had about 700 miles of railway lines in operation, 2712 miles of highways (trunk roads, 1591 miles), and a number of navigable rivers. The coastal cities are touched by the inter-American airways network. In 1933, 275 steam and motor vessels entered Guayaquil, the chief port.

Government. The Constitution of 1929 vests executive power in a president elected by popular vote for four years. The legislative branch consists of a Senate of 32 members and a Chamber of Deputies of 56 members elected by literate male and female citizens who are at least 21 years of age. President at the beginning of 1935, José María Velasco Ibarra (Liberal), who assumed office Sept. 1, 1934.

History. The struggle for power between the executive and Congress, which had kept Ecuador in the throes of political agitation since the establishment of a constitutional régime in 1929, continued with undiminished violence in 1935. On August 20, President Velasco Ibarra was overthrown by the army after he had issued a proclamation dissolving Congress and attempted to establish a dictatorship. He was the fourth legally elected president ousted or disqualified by Congress since 1931.

Although the President was formerly presiding officer of the Chamber of Deputies when that body ousted his predecessor, President Martínez Mera, he came into conflict with Congress almost from the beginning of his administration. Like previous executives, he found that the government was unable to function due to Congressional obstruction and consequently strove to reduce the power of the legislative chambers. A plot against the government, led by former Provisional President Larrea Alba, led to the latter's deportation in February, 1935. As the year progressed, President Velasco Ibarra gradually extended his powers. He imprisoned many opponents both within and without Congress, established a press censorship, and formed a semi-Fascist organization, known as *Acción Cívica*, to support his policies. Early in August the opposition won control of the Senate, electing two of their leaders as president and vice-president, respectively, of that body. With the government claiming a majority in the lower house, a deadlock ensued which the President sought to break on August 20 by dissolving Congress and calling new elections. The military immediately forced him to resign.

The army replaced Velasco Ibarra, who was exiled to Colombia, with Antonio Pons, another Liberal. The latter proceeded with plans for a Congressional and presidential election, but finding himself at loggerheads with Liberal factions in Congress, suddenly resigned on September 26. He declared that factionalism among the Liberals made a Conservative victory in the elections practically certain. The army immediately established a military dictatorship under Federico Páez, Minister of Public Works. Congress was dissolved, the elections fixed for October were cancelled, and the leaders of the Conservative party were either imprisoned or exiled from the country. The new Provisional President announced that a constitutional assembly would be convened to revise the Constitution, the indications being that the powers of Congress would be sharply curbed. In announcing the appointment of his cabinet on October 2, Provisional President Páez decreed a pay increase ranging from 10 to 25 per cent for army officers and privates.

The Páez régime early came into conflict with the Roman Catholic Church which was closely aligned with the Conservatives. On October 1 a Jesuit superior was arrested in Guayaquil and on October 15 decrees were issued nationalizing the church and the clergy. Foreign priests and ministers were ordered to terminate their ministrations

within six months, while the churches and other religious edifices were declared state property. Coincident with the issuance of these decrees the Socialist party announced its full support of the dictatorship and promised to take up arms in its defense in the event of a Conservative revolt.

The problem of regulating foreign exchange transactions continued to present difficulties to the government, although the favorable balance of trade made it possible throughout most of the year for importers to obtain without delay the needed exchange to pay for their foreign purchases. Exporters were required, however, to deliver 25 per cent of the value of their bills to the Central Bank. The exchange thus obtained was used to liquidate commercial obligations incurred prior to the exchange control law of Nov. 27, 1933. It was estimated that these obligations were fully liquidated by the end of 1935. With the improvement of conditions the exchange control law of Nov. 27, 1933, was revoked by the executive decree of Oct. 7, 1935.

Tension with Peru. During November the long-pending frontier dispute between Ecuador and Peru, involving particularly the territory comprised between the old and new channels of the Zarumilla River, reached a critical stage as a result of mutual charges of violations of the *status quo* agreement reached in 1933. Both countries sent additional troops to the region in dispute and the press in Quito and Lima indulged in heated recriminations. On November 29 the Peruvian Foreign Office announced that it had invited Ecuador to submit the dispute to the Permanent Court of International Justice at The Hague. The Peruvian invitation was based on Article XIII of the Covenant of the League of Nations. Although both countries were members of the League, they had agreed by the Ponce-Castro Protocol of June 30, 1924, to submit their dispute to an arbitral decision by the President of the United States in case direct negotiations failed. Direct negotiations for a settlement of the boundary issue were in progress in Washington between plenipotentiaries of Ecuador and Peru when the tension along the frontier developed.

EDUCATION IN THE UNITED STATES. Statistics. Attendance. The latest reports from the United States Bureau of Education are for the school year 1933-34 and are complete for only 41 States. Comparisons of enrollments in these States for 1931-32, and for 1933-34 show that the total enrollment in the schools increased by only 0.3 per cent. Considering only the kindergarten and eight elementary grades there was a decrease of 1.6 per cent. In the high schools there was an increase of 8 per cent.

The greatest per cent of decrease was 10.8 in the kindergarten and the greater increases were in the upper years of the high school. The number of postgraduates increased from 30,273 to 51,412, making a difference of 70.4 per cent.

The table in column two shows the enrollment of pupils by grades in 41 States for 1931-32 and for 1933-34.

Expenditures. In the 41 States that reported to the United States Office of Education for 1933-34, the expenditures for current expenses decreased by 18.3 per cent from 1931-32 to 1933-34. Expenditures for capital outlay in these same States decreased 68.4 per cent. Expenditures for interest decreased 9.6 per cent.

The total amount paid for salaries of teachers, principals, and supervisors in 1932 was \$1,265,443,-

Grade	Enrolment 1931-32	Enrolment 1933-34	Percentage change
Kindergarten *	421,023	375,589	-10.8
First	2,741,762	2,610,923	-4.8
Second	1,911,334	1,804,503	-5.6
Third	1,822,543	1,789,689	-1.8
Fourth	1,767,165	1,759,632	-0.4
Fifth	1,671,364	1,644,665	-1.6
Sixth	1,547,420	1,556,565	+0.6
Seventh	1,383,544	1,464,016	+5.8
Eighth	1,116,811	1,143,415	+2.4
Total	14,382,966	14,148,997	-1.6
First year high	1,190,228	1,208,193	+1.5
Second year high	946,152	1,028,454	+8.7
Third year high	746,071	830,105	+11.3
Fourth year high	620,377	698,014	+12.5
Post graduate ^b	30,273	51,412	+70.4
Total	3,533,101	3,816,178	+8.0
Grand total	17,916,067	17,965,175	+0.3

* 29 States only. ^b 17 States only.

910. In 1934 the total was decreased to \$1,058,595,-297.

Teachers, Principals, and Supervisors. In the 41 States that reported there was a decrease of 10,387 teachers, principals, and supervisors or 1.7 per cent between 1931-32 and 1933-34. In the two years prior to 1931-32 the number of such officers had increased 6421 or 1.0 per cent.

School Buildings. Early in 1935 the United States Office of Education completed a survey of needed school-building construction throughout the country. Basing estimates upon the returns received from 24 State departments of education and half of the cities of over 2500 population in 45 States, the U.S. Commissioner of Education reported to Public Works Administrator Harold L. Ickes that there was immediate need for \$625,999,022. Meanwhile, more than half of the schools constructed during 1934 were financed from Public Works Administration allotments. Mr. Harry L. Hopkins, Federal Emergency Relief Administrator, reported in June that during the last year work projects on school buildings in the States and in Puerto Rico had been conducted to the extent of repairing and improving 30,188 school buildings, and 417 State college, State normal, and university buildings. A total of 1856 new school buildings and additions were built and 36 new State college and university buildings were constructed.

As regards the public schools, this is the largest outlay of funds for buildings ever recorded for a single year. In various places school buildings costing much more than the community could ordinarily afford have been constructed and equipped.

Loyalty Oath Laws for Teachers. During the year, educators have been deeply concerned with the movement to require from school teachers as well as those teaching in colleges and universities an oath of allegiance to the United States and to the State in which they work. Bills were introduced in sixteen States. In seven they were passed and became laws; in two, Delaware and Maryland, they passed the legislature but were vetoed by the governors; in seven other States the legislation was defeated. These States are Connecticut, Florida, Illinois, Iowa, Kansas, Pennsylvania, and Wisconsin.

In all there are 19 States now having laws requiring the "loyalty oath." These States and the dates when oaths became legal requirements are Arizona, 1935; California, 1931; Colorado, 1921; Georgia, 1935; Indiana, 1929; Massachusetts, 1935; Michigan, 1931; Montana, 1931; New Jersey, 1935; North Dakota, 1931; New York, 1934;

Ohio, 1919; Oklahoma, 1923; Oregon, 1921; South Dakota, 1921; Texas, 1921; Vermont, 1935; Washington, 1931; West Virginia, 1923.

Rhode Island has no law but requires through the board of education a loyalty pledge from all its teachers.

The usual form of the loyalty oath is as follows:

I do solemnly swear, or affirm, that I will support the Constitution of the United States, the constitution of the State of _____ and the laws enacted thereunder, and that I will teach, by precept and example, respect for the flag, reverence for law and order, and undivided allegiance to the government of one country, the United States of America.

In the New York Legislature, a bill was introduced which would have required all students in publically supported institutions to take a loyalty oath. It is generally held that only the vigorous action of the undergraduates in the colleges prevented the passing of the bill.

A resolution calling upon the States to enact loyalty oath laws was defeated in the House of Representatives at Washington.

There are influential agencies behind the introduction of such bills. Among these are the Daughters of the American Revolution and the American Legion.

Those who urge the bills believe that there is a very serious danger of the spread of communism and radicalism through the schools. By means of this oath they expect to "weed out the radical teachers and professors who preach communism and radicalism to our young."

There has been much opposition to the loyalty oath. Many have expressed their opinion that these laws represent a real threat against academic freedom. Colleges and universities have been concerned for "academic freedom" for the past several years, but this is the first time that this has become an important matter in the public schools. The public school teachers are not greatly disturbed over the taking of the oath. Their difficulties come when the meaning of the oath is interpreted by those who believe that youth should be kept in ignorance of the various schemes of government that differ from our own. Teaching about communism or Naziism is, in the judgment of teachers, a very different matter from leading the learners to adopt these forms. Yet this is the exact interpretation that some zealous advocates of patriotism have read into the law.

The causes that seem suddenly to have brought educators into suspicion on the part of the public are easy to understand. The mere existence of concern for the outcome of the schools' influence upon the learners implies a confidence in the possibilities that the school possesses.

This confidence in the power of education has been present in our country from its beginning. Different results have been expected from the schools in different periods in our history. At first public as well as private education had a pronounced religious emphasis. Children learned religious precepts as an important part of their regular school work. A considerable part of all the school's efforts was devoted to the task of teaching youth those skills that would enable them better to practice the accepted Christian virtues.

The teaching and learning in this period took place in the small schoolhouse which was an integral part of each community. Parents knew just what was happening in this school. No terms were used in the school that were not understood by those whose children were receiving instruction. The teachers were usually men who took part in

all of the community affairs and often were the leaders and guides in matters that concerned the common welfare.

In this period there was no concern for "academic freedom." The problem did not exist. The "little red schoolhouse" shared with the church and the homes the responsibility for developing the characters that citizens were expected to acquire.

When the colonies united to form the United States the dominant concern of the school changed and became political or patriotic. The religious aim still existed in education but it was no longer the only or even the most important end of school effort. The textbooks that were used were filled with patriotic sentiments. Boys and girls in the upper years read and recited the speeches that famous patriots had made and were expected to be fired with some of the zeal that had moved those who had thus spoken.

In this period, there was no problem regarding "academic freedom." Neither were schools in general under any suspicion of teaching disloyalty. There was still a close relationship between the school and the homes that supported it. Also those who taught were active in the affairs with which the public was concerned.

Following the Civil War the trend was increasingly toward industrial efficiency. By the beginning of the new century industrial subjects and industrial schools were common. Even small high schools offered elaborate training in commercial subjects which included stenography, typewriting, accounting and business law, and commercial practices. Business arithmetic and commercial geography were often added to the regular school work.

This change in the controlling aim of the school was accompanied by another change of even greater significance. The small schools with their intimate relationship with the homes had given way to large schools which often housed hundreds of children and employed a number of teachers. Under such conditions it was necessary to employ teachers who had no part in the management of the community in which they taught. Normal schools were training such persons for more efficient service, but such training often served to widen the lack of understanding between the public and the schools. The language of education became one not understood by patrons. Children were measured, tested, graded, and grouped by methods that parents did not understand. Mysterious terms such as "X, Y, and Z groups" and "opportunity classes" began to appear. It is no secret that educators used these terms to keep from those concerned the real significance of their procedure. This was not done for the purpose of deceiving children and their parents, but rather to prevent the difficulties that were certain to arise if they knew exactly what was happening. It was argued that for the "bright" child to know that his place in an "X" division indicated that he was superior intellectually would result in making him snobbish and conceited. In the same way, a child who was aware that he was in a "Z" division because he was mentally inferior would be discouraged. Among educators there have been many who have seriously questioned the advisability of such practices.

Whatever may have been the motives of educators in their conduct of the schools, in recent years a lack of understanding and consequent suspicion has resulted. This lack of confidence in educators is evident in the large number of State laws that

have been enacted within the past dozen years. Such laws prescribed not only what must be taught but also what must not be taught.

The movement to control the activities of the school has been coincident with the lack of understanding between parents and the school. The schools have been making determined efforts to remove this difficulty. Great numbers of schools have organized and fostered parent-teacher associations with two avowed purposes. One is to enable parents to understand what the school is attempting to accomplish and the other is to secure from parents their suggestions for improvements in the school programme. Educational week now generally observed in the schools is another attempt to reestablish an understanding between the schools and the community.

There are evidences that we may now be at the beginning of another period in the life of the schools. Just as the aims changed from religious to political and then to industrial, so now the aim seems to be changing to what may be characterized as social.

In many schools, even in the elementary grades, children are now considering problems that were not regarded as suitable for them, even five years ago. The subject of housing is now one of the most prominent topics in the public schools. The newer conception of the need to make education practical forces teachers to consider the problems that are of significance to the learners and to those with whom they are associated. Problems relating to labor and capital, various forms of government and proposed changes within our own government are certain to find their way into any modern classroom that aims to deal with existing conditions. Each problem of this nature invariably has partisan aspects. No matter how discreetly the teacher treats the questions raised, there is a large possibility of misunderstanding on the part both of the learners and of those outside the school who have no direct knowledge as to what does take place within the classroom.

Many even among educators have serious doubts regarding the sufficiency of knowledge possessed by the ordinary teacher to deal with complicated social problems that are often treated in schools.

It is the necessarily partisan nature of social problems and the lack of competent knowledge that teachers are supposed to have that leads directly to the attempts that legislatures have made to determine what may be taught and to the additional efforts that are now being made to make certain that teachers are loyal to the social order under which they now work.

The problem is a new one for the public schools. It is impossible to predict what the solution will be. It may happen that the Federal government will enlarge the scope of its control over different aspects of education just as it has in the past taken a large responsibility for vocational training and more recently has assumed virtual control over parts of nursery school education and the National Youth Administration movement.

School authorities are endeavoring to meet the issue in part by raising the academic and professional qualifications of teachers with the expectation of providing a larger supply of highly qualified persons. Everywhere also there are indications that the schools are increasing their efforts to cooperate with all agencies that are interested in the training of youth.

Any extension of this tendency to restrict the

freedom of teachers is certain to have important bearings upon the schools concerned.

Survey of Public Education in New York State. The Board of Regents of New York State are undertaking what promises to be the most comprehensive investigation of school affairs ever attempted in a State. Mr. Owen D. Young, one of the board, will serve as chairman of a special committee. He will be assisted by two other regents, William J. Wallin of Yonkers, and John Lord O'Brian of Buffalo.

The General Education Board has appropriated \$494,000 for the survey and the committee has selected a number of specialists who will conduct various parts of the survey.

The main divisions of the survey were stated by Mr. Young as follows:

- (1) Study of the financial problems of the system, including the examination of the present school district organization.
- (2) Study of elementary education with a view to re-evaluation of the curriculum and of the auxiliary services, including those for handicapped children, provided through the elementary schools.
- (3) Study of all types of education of the secondary level, whether general or vocational or designed for special groups of students, whether furnished by schools or other agencies, with a view of evaluating the appropriateness and adequacy of these provisions.
- (4) Study of the demands and provisions for adult education and higher education at public expense.
- (5) Study of the selection, training, quality, and standards of compensation of the teaching personnel, with a view to determining the future rôle of the teacher-training institutions.
- (6) Study of Federal aid to reveal the influence of existing Federal subsidies and regulations on the range and character of special types of education, and to determine the policy which the State should follow with respect to seeking or accepting Federal appropriations.
- (7) Study of the State Education Department with a view to determining the effectiveness of its organization and the desirable scope of its functions.
- (8) Revision of the education law.

The Julius Rosenwald Fund. The biennial report of this fund states that during the past two years the following projects have received aid: Negro education, \$330,000; Negro health, \$95,000; race relations and social studies, \$200,000; general education, \$120,000; library extension, \$100,000; medical services, \$190,000.

The Fund has under way a thorough exploration of rural education in the South. During the past year eight groups of "explorers," half white and half colored, have lived in various communities in Georgia, Arkansas, and Louisiana. They have made a careful study of all phases of country life. The results of these studies have been reported to a council on rural education. This council is composed of prominent persons interested in the general matter of education. These persons represent various parts of the country and meet in conference for several days two or three times during the year. In these conferences the reports of the field workers are submitted and discussed and further steps are determined.

EGGS. See LIVESTOCK.

EGYPT. A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1935, King Fuad I.

Area and Population. Excluding the Anglo-Egyptian Sudan, Egypt has an area of about 386,000 square miles, of which only 13,600 square miles in the Nile valley are occupied. The estimated population in 1934 was 15,230,000, including 40,000 nomads (14,217,864 at the 1927 census). Births registered in 1933 numbered 668,467; deaths, 420,756. Estimated populations of the chief cities in 1931 were: Cairo, 1,200,000; Alexandria, 643,000; Port Said, 113,000; Tanta, 98,400; Mansûra, 73,300; Asyût, 60,000; Damanhûr, 57,500. Moslems

comprised 91 per cent of the 1927 population; Christians, 8.34 per cent; Jews, 0.02 per cent.

Education. About 88 per cent of the population was illiterate in 1927. The population of school age (5 to 19 years) in 1927 was 4,734,110; the school attendance in 1930-31 was 891,682. The State University at Cairo had 2222 students in 1932-33.

Production. The 8,597,500 acres devoted to crops and orchards in 1933 supported directly about 62 per cent of the total population. About 32 per cent of the cultivated land is devoted to cotton, the chief money crop. The cotton yield in 1934-35 was 748,548,000 lb. (849,406,000 lb. in 1933-34). Production of other crops in 1934 was: Wheat, 37,276,000 bu.; barley, 9,033,000 bu.; corn, 61,880,000 bu.; beans, 10,058,000 bu.; rice (rough), 24,887,000 bu.; onions, 563,432,000 lb.; sugar cane, 2,307,000 metric tons (1933). Livestock in 1933 included 912,000 cattle, 857,000 buffaloes, 1,345,000 sheep, 13,000 swine, 490,000 goats, 154,000 camels, and 753,000 asses. Fishing is an important industry. Mineral production in 1933 was (in metric tons): Petroleum, 237,725 (221,000 in 1934); phosphate rock, 440,632; manganese ore, 187; cement, 286,864.

Foreign Trade. Imports for consumption in 1934 were valued at £29,236,000 (£26,757,000 in 1933) and exports of Egyptian products at £31,048,000 (£28,104,000 in 1933). The United Kingdom supplied 22 per cent of the 1934 imports (23.1 in 1933); Japan, 11.8 (10.7); Germany, 7.3 (7.6); Italy, 7.0 (7.8). The United Kingdom took 32 per cent of the 1934 exports (40.1 in 1933); France, 9.7 (12.5); Germany, 9.1 (8.1); Japan, 8.9 (5.0); Italy, 8.1 (7.6). Leading 1934 exports were (in \$1000): Raw cotton, 76,424; cottonseed, 4518; cottonseed oilcake, 2292; onions, 1866; rice, 1818.

In 1935 imports totaled £32,233,000; exports, £35,604,000. Imports from the United States were \$10,474,396; exports to the United States, \$8,910,982.

Finance. Budget estimates for the fiscal year ended Apr. 30, 1936, were: Receipts, £32,846,000 (£31,662,000 in 1934-35); expenditures, £32,846,000 (£31,632,000 in 1934-35). Actual returns for 1933-34 were: Receipts, £32,630,000; expenditures, £30,549,000.

The public debt as of Oct. 31, 1934, totaled £97,009,860 (consolidated debt, £88,844,040). It was practically all held in England. The Egyptian pound, the unit of currency, fluctuated with the pound sterling at the constant ratio of 1 pound sterling equals 97½ per cent of the Egyptian pound. The average noon buying rates for cable transfers in New York was \$5.1652 in 1934, \$4.3439 in 1933, and \$3.5954 in 1932.

Communications. Egypt in 1933 had 2993 miles of railway lines (state, 2115 miles; private, 877 miles), which carried 45,924,000 passengers and 5,599,000 metric tons of freight, with gross receipts of £5,091,000. Highways extended about 4135 miles. From Cairo there was regular airmail and passenger service to Europe, India, and South Africa. The net register tonnage of vessels entering Egyptian ports in the overseas trade in cargo and with ballast in 1934 was 8,194,000 (7,360,000 in 1933). See SUEZ CANAL.

Government. The Constitution of Oct. 23, 1930, was abolished on Nov. 30, 1934, and Parliament was automatically dissolved (see 1934 NEW INTERNATIONAL YEAR BOOK, p. 206). A non-party cabinet under Mohammed Tewfik Nessim Pasha was formed Nov. 14, 1934, and the King and cabinet during 1935 exercised complete executive and legislative powers. See *History*.

HISTORY

Nessim Pasha's Rule. After three years of quiescence, the Egyptian nationalist movement centring in the Wafd (Nationalist party) erupted in 1935 in a determined and at times violent drive for a larger measure of independence. Commencing in November, a great wave of riots, student strikes, and popular demonstrations forced the restoration of the democratic Constitution of 1923 and the reopening of negotiations for a treaty settlement of the outstanding issues between Britain and Egypt. The basis for a nationalist resurgence had been laid late in 1934. King Fuad's confidant and controller of the royal estates, Ibrahim Zaki El Ibrashi Pasha, had been eliminated as the sinister power behind the throne; a new government had been formed by the liberal political leader, Mohammed Tewfik Nessim Pasha; and the autocratic Constitution of 1930 had been abolished by royal decree (see 1934 YEAR BOOK, p. 206).

Nessim Pasha's restoration of the freedom of speech and assembly, suppressed by his predecessors, enabled the Wafd to inaugurate its campaign for a return to power with a great political rally on the outskirts of Cairo Jan. 8-9, 1935. The rally was notable for the discipline and orderliness of the crowd of 30,000 persons gathered from all parts of Egypt and for the moderate and statesmanlike policies advocated by the Wafd leaders. The resolutions adopted called for the restoration of the 1923 Constitution, under which the Wafd had won overwhelming control of Parliament; urged the early settlement of British-Egyptian questions on a friendly and honorable basis; and unequivocally endorsed the leadership of Mustafa Nahas Pasha, the dominant personality in the Wafd movement.

For the time being the Wafd, controlling an unquestioned majority of the Egyptian voters, gave its friendly support to Nessim Pasha, who was engaged in a wholesale housecleaning and reorganizing of the government. Previous ministries, under the influence of the Palace, had filled governmental posts with corrupt and incompetent officials and created many new sinecures. Pending the completion of his reforms the Premier postponed consideration of the two all-important problems of a new constitution and new elections. Ruling by decree and without a Parliament, Nessim Pasha created a separate Ministry of Commerce and Industry in May; awarded a \$5,000,000 contract for reinforcing the Assiut barrage; canceled on May 2 the gold clause in all international financial contracts carried out in Egypt, thereby legalizing the payment of the government's obligations in depreciated paper currency; voted total credits of £36,000,000 on May 22 for a five-year programme of public works; imposed effective September 21 an additional ad valorem duty of 40 per cent on imports of Japanese cotton, rayon, and knit goods, which had been steadily replacing similar British products in the Egyptian market; concluded agreements with the principal mortgage institutions to lighten the burden of mortgage debtors; aided the peasants by distributing bounties for exports of certain farm produce; abolished the tax on cotton and reduced the stamp tax by 50 per cent; and reduced the annual fees paid by farmers who purchased government lands and other property. He also concluded a commercial agreement with Palestine and sent a delegation to England to initiate negotiations for an adjustment of Anglo-Egyptian commercial relations.

Nessim Pasha also completed the downfall of Ibrashi Pasha. Finding his efforts again obstructed by intrigues at the Royal Palace, he threatened on April 18 to resign unless Ibrashi were ousted. The British Residency lent its powerful support to Nessim Pasha's demand, and on April 22 the King agreed to remove his favorite, who was named Minister to Belgium. Meanwhile the arbitrary actions of the rector of the Moslem University of El Azhar in Cairo, an appointee of Ibrashi's, had created such unrest among the students that the ancient institution was closed for six months on April 10.

Effect of Ethiopian Crisis. The development in the early summer of the Anglo-Italian crisis precipitated by Mussolini's impending assault upon Ethiopia had immediate repercussions upon the political situation in Egypt. Apparently in response to the influence of the British High Commissioner, Nessim Pasha delayed longer than the Wafd leaders thought necessary in arranging for the promised restoration of constitutional government. With a possible war with Italy looming on the diplomatic horizon, the British were not anxious to be harassed by an aggressively nationalistic government in Egypt. The conservative elements in Egypt shared in these fears, recalling the violence and popular unrest stirred up during the period of Nationalist control over Parliament.

The resentment which had been accumulating against the Premier for his failure to restore the 1923 Constitution was thus shifted to the British Government. On June 27 the Wafd leader, Nahas Pasha, denounced Britain for blocking a return to the Constitution but at the same time announced that his party would continue to support Nessim Pasha's government. As the tension between Britain and Italy increased and an Italian army was massed in Libya, within 300 miles of Alexandria, Egypt became the focus of extensive British military and naval preparations. Alexandria became an important British naval base. British army and air forces in Egypt were greatly strengthened and the areas reserved for their use were extended. These measures aroused fear that if war broke out Egypt would again revert to its World War status as a British protectorate, without even a pretense of local autonomy. Much resentment was aroused by the charge that the British had taken their military measures in Egypt without consulting the nation or the government, although the British insisted that all their steps had been previously agreed to by Nessim Pasha. By the extreme nationalists the Premier was accused of being a pliant tool of British imperialism. They demanded that Egypt withhold its aid and cooperation until the British had accepted a treaty liquidating all the outstanding issues and establishing Egyptian independence on a permanent basis.

The moderates, following Nessim Pasha's lead, contended that Egypt's chances for independence would be greater if she extended loyal cooperation to Britain in the latter's hour of need than if the situation was used for hargaining purposes. In line with this policy the Egyptian Cabinet joined with the governments of Ethiopia and the Anglo-Egyptian Sudan in concluding the long-sought agreement for the construction of the Lake Tsana dam and the distribution of its impounded waters as released through the Blue Nile. Under this agreement, announced at Cairo June 1, Egypt was to bear 90 per cent of the cost of construction (estimated at \$10,000,000) and was to receive 90 per cent of the stored water (for details of the

agreement, see ETHIOPIA under *History*). On September 4 the Egyptian Cabinet approved the agreement with the Sudan Government for the distribution between the two countries of the Lake Tsana waters. On October 31 the Cabinet went even further in its cooperation with Britain. Although not a member of the League of Nations, the government announced that it would join the League powers in the application of economic and financial sanctions against Italy, basing its action upon the Kellogg-Briand Pact, of which both Italy and Egypt were signatories. This step provoked a strong protest and threats of retaliatory action from Italy.

Despite the strong criticism of Nessim Pasha aroused in the Egyptian press and extreme nationalist circles by his pro-British policy, the moderate leaders of the Wafd reiterated their support of him on October 23. On November 7 the British strengthened his position further by promising that there would be no change in Egypt's status in case of war and that they would withdraw their warships from Alexandria as soon as the crisis had passed. On November 9, however, the British Foreign Secretary, Sir Samuel Hoare, in a speech at London Guildhall made the maladroit confession that when consulted by Nessim Pasha the British Government had "advised against the reenactment of the Constitutions of 1923 and 1930, since the one was proved unworkable and the other universally unpopular."

Although Sir Samuel in another part of his speech denied that Britain opposed the establishment of a constitutional régime "suited to Egypt's special interests," his speech was regarded as proof that the London government had blocked the restoration of the 1923 Constitution, the achievement of which was the cornerstone of the Wafd's policy. The Wafd formally withdrew its support of Nessim Pasha on November 12 and the following day serious anti-British riots broke out in Cairo and Tanta during which the police fired into a crowd of students, killing two. Led by the aroused students, the anti-British demonstrations continued sporadically for nearly a month, with the death list rising to eight and the number injured to more than 300. The students literally forced the various political leaders to drop their personal feuds and ambitions and join in a united demand for the restoration of the 1923 Constitution.

On December 11 Nessim Pasha and his Cabinet agreed to resign, asserting that they could not carry on the government in the face of the nationwide demand for the old Constitution. The British and King Fuad then capitulated and on December 12 the King issued an imperial rescript restoring the 1923 Constitution. Nessim Pasha announced that he would retain the Premiership until after parliamentary elections were held. At the close of the year, the students and the Wafd were pressing him to hold the elections early in 1936 and were prepared to continue their anti-British agitation until a treaty of alliance had been signed on a basis of equality between Egypt and Britain. The draft treaty of 1930 was declared acceptable to the leaders of the Egyptian united front (see 1930 YEAR BOOK, p. 240).

See ETHIOPIA, GREAT BRITAIN, and ITALY under *History*.

ELECTION DISORDERS. See KENTUCKY. **ELECTRICAL ENGINEERS.** AMERICAN INSTITUTE OF. A national organization founded in 1884 for the purpose of advancing the theory and

practice of electrical engineering and the allied arts and sciences and of maintaining a high professional standing among its members. There are three grades of members: Associate, member, and fellow. The total membership on Oct. 1, 1935, was 14,623.

In 1935 there were 61 sections of the institute located in various cities throughout the United States and 117 student branches in colleges giving courses in electrical engineering. In addition to district, section, and student branch meetings there were held an annual winter convention in New York City, Jan. 22-25, 1935, and an annual summer convention in Ithaca, N. Y., June 24-28. Much of the institute's work is accomplished through its general and technical committees, of which there were 42 in 1935. Its principal publications are the monthly *Electrical Engineering*, the *Standards of the A.I.E.E.*, and the *Year Book*.

The officers elected for 1935-36 were: President, E. B. Meyer; vice-presidents, C. V. Christie, Mark Eldredge, R. H. Fair, W. H. Harrison, N. B. Hinson, F. O. McMillan, F. J. Meyer, G. G. Post, R. H. Tapscott, W. H. Timbie; treasurer, W. I. Slichter; secretary, H. H. Henline. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

ELECTRICAL ILLUMINATION. The movement for greater consideration of the human eye, known as "Better Light, Better Sight," which was started at the end of 1934 was pushed as a campaign of education. Special scientifically designed fixtures, both for desk and room lighting, were sponsored by the Illuminating Engineering Society, made by numerous different manufacturers and sold in many places at prices within the reach of the masses. Educational exhibitions were held in many places, including schools in small towns, with the end of teaching people that it was worth while to show consideration for the eyes in order that good sight may be retained in the later years of life. It was shown that although it is the present practice of using from 10 to 20 foot candles for reading and fine work, it would be still better to have 100 foot candles, properly distributed without glare, were it not too expensive. But this proved that although much improvement has been made in the last 10 years we are still far below the ideal.

The "Visibility Meter" is a new instrument for evaluating the ease or difficulty with which a piece of work or reading matter may be seen. It is in the form of a pair of binoculars through which the work may be viewed and in which are screens of varying density. These are rotated until the object is just discernible as in many of the popular exposure meters for photographers. One side indicates relative visibility and the other side indicates desirable illumination in foot candles.

In 1935 there were sold 410 million incandescent lamps of large sizes and 297 million of miniature sizes. Among the latter was a novelty in the way of a very small lamp about one-eighth inch in diameter which has a convex lens cast in the glass. It is used in a miniature battery flash-light (3 in. by $\frac{1}{2}$ in. diameter) which fits in the vest-pocket and may be used for finding a key-hole or looking at a programme in a darkened theatre.

Improvements in highway lighting were accomplished by the further elimination of glare. This was effected by the use of improved luminaires and reflectors and the sodium vapor lamp. The 10,000-lumen lamp showed an increase in efficiency of 16 per cent over that of the preceding

year. These lamps now gave from 45 to 50 lumens per watt, as compared to 12 in the small house incandescents, and 20 in the larger sizes. The life of the new sodium vapor lamp was said to be from 1500 to 2000 hours. Also a new luminaire for street lighting for use with Mazda lamps showed an increase in efficiency of 50 per cent over those of previous models. A new double-filament headlight lamp for automobiles had its filaments in the form of two straight bars arranged in such a manner that one throws the light straight ahead while the other throws the light, not only down as the older ones did, but off to the right to illuminate the right shoulder of the road and thus make it convenient for the driver to keep close to his side without the danger of going off the pavement.

A new lamp for æsthetic effects had a brilliant but small 3-watt lamp totally enclosed in a fluorescent tubular screen. This gave a large source of light of low intrinsic brilliancy and of pleasing hues. A new light-meter for measuring illumination in foot candles is so small that it will go in the vest-pocket. It is $2\frac{1}{4}$ inches square by $1\frac{1}{4}$ inches thick and works on the principle of a photo-voltaic cell and ammeter. A new photo-electric spectrophotometer analyzes the various colors of the rainbow in any light and plots the relative intensities of the various components in wave-lengths. Another instrument measures the amount of short-wave light which comes from a source of ultra-violet light.

An instrument known as a "Stroboglow" was developed which gives a flashing light many times per second, from a neon light. By timing the flashes with the revolutions of a machine the moving parts appear to be standing still or may be made to appear to revolve very slowly so the parts or the movement may be studied. Distortions in the machinery may be observed. For studying the color and reflecting power of surfaces a new photo-electric device compares the direct light on, and the reflected light from, any surface and thus measures its reflecting power and indicates it on a dial.

ELECTRICAL INDUSTRIES. The steel mills of the country have spent millions of dollars this year in building the very latest and best of strip mills for producing sheet steel and this has involved very large orders for electric motors and control because all of them are electrically driven and require much power. These mills produce the sheet steel from which are made automobiles, furniture, tin cans, etc. One of these mills has 12 continuous roll stands using 39,000 h.p. in 13 motors. This will produce strip 72 inches wide at the rate of 2000 feet per minute. There are 6 alternating current induction motors for constant speed and 7 direct current motors for adjustable speed.

Another mill has a run-out table, like a moving platform, to carry the long strip away. This is driven by some 30 gear motors, small high speed motors which drive their load at slow speed through a worm gear. In a cold strip mill it is desirable to keep the strip under tension so the coil of cold strip is held by two cones pushed in the centre of the coil from the two sides like a two-part spool, and as the strip reels out it revolves the cones and these drive electric generators. By controlling the output of these generators the tension on the strip is regulated. In another mill the pressure on the sheet between the two rolls of a stand is measured and indicated by an electric strain gauge. Thus the operator can regulate the pres-

sure (in millions of pounds) to a required value with a discrepancy of only a few per cent. In some of these mills there are so many motors in one room that their losses cause an excessive temperature. This is taken care of by a closed-circuit ventilating system. The air is drawn down through the motors and sent through a cleaner and cooler and then returned to the motor room. This latter is closed tight and kept slightly above atmospheric pressure by a make-up blower which brings in cleaned air from the outside. This prevents dust and dirt from getting in from the street.

Electron tubes are playing an increasingly useful and important part in industry serving as sentinels and switchmen to turn on and off and regulate power at particularly important moments. Thus in a paper mill the tension on the paper must be kept constant and this tension is indicated by the slack or droop between consecutive rolls. By sending one beam of light just under where the paper should be and another just above that place, and focusing these beams on two photo-cells, any increase or decrease in the slack will interrupt the beam and the photo-cells will start a corrective action. In the spot welding of thin materials it is necessary to have very exact control of current and time in order that the weld will be good and yet not burn the material. These welds are made with many spot-welds per inch and many per minute. Each weld will require a certain current for a definite number of cycles of a 60-cycle current. A three electrode tube can not only count off the cycles from 1 to 30 (one-half second) but can start the current at just the right part of the cycle of the voltage curve so there will be no transient component of the current and thus a perfectly definite value of current.

Last year the two large electric manufacturing companies sponsored an exhibition of the electric equipment for the model modern home. This year the General Electric Company held a competition for architects for the design of such a home at moderate cost and actually built several of them in different parts of the country to show people what electrical conveniences and comforts were available at a moderate price, if the home were properly designed. This included electrically controlled oil heating, air-conditioning, refrigerator, electric range, clothes washer and dish washer, ironer, and the usual better known devices. The Federal Government built a whole town, Mason City, Oregon, for the employees on one of its projects, in which everything in the homes including the heating, was done electrically. Not a house in the town had a chimney. Several large dredges were built in which considerable improvements in control and regulation have been incorporated. These have been accomplished by supplying the main motors from an auxiliary set in which the voltage and frequency may be accurately controlled. In one dredge for the Fort Peck Dam the motor which drives the cutter head is made to give a definite constant torque at a controlled speed. This is accomplished by the Kramer system of control in which the current at slip frequency from the rotor of the large induction motor is led to a converter and other devices and fed back to the line. This makes it possible to control the slip and current of the rotor as is done with a resistance, but the energy is returned to the line.

A very large shovel for open pit coal mining takes 32 cubic yards, or 48 tons, at one bite. It weighs 1300 tons, has a reach of 110 feet, and can raise the material to a height of 70 feet. The total

power is 3500 h.p. in 10 motors and in addition a motor generator set for control of special motors.

The electrical industry is making a serious fight against noise, that insidious enemy of nerve-health which civilization has produced. Great improvements and simplifications have been made in noise measuring apparatus. It is becoming the custom to test the first few motors of every new line in a "sound proof" room, measure the noise it makes, and see that the amount is within certain established limits of decibels. Improvements in methods of dynamic balancing have gone so far that this source of noise has been eliminated, but magnetic and air vibrations are not so easy to eliminate.

Lift bridges are superseding the turning type and this has brought in the problem of lifting all four corners of the bridge at exactly the same speed to prevent jamming at one corner. The new Cape Cod Canal Bridge is the longest and the Triborough Bridge in New York City is probably the widest. These are lifted by induction motors and controlled by "Selsyn Motors" which act as if they were all on one shaft, although the connection between them is only electrical.

An almost unbelievable effect is obtained by a new "Pre-recording Oscillograph" which takes a picture of something before the shutter is tripped instead of after tripping as in the ordinary camera. It is used for recording unexpected events in an electric circuit such as lightning and short-circuits. The indicating device is in operation all the time and makes a trace of light on a fluorescent screen which has a time lag so that the picture on the rear appears about $\frac{1}{30}$ second after the stimulations on the front. The camera views the rear of the screen. Any disturbance trips the shutter of the camera in a very short interval and the camera records what began to happen $\frac{1}{30}$ second earlier.

A new and much more powerful permanent magnet steel was produced which is strong enough magnetically to replace electromagnets in many devices, such as loud speakers and contactors for control. A magnet of this material will lift 60 times its own weight.

A new magnetic steel for transformers and high class apparatus was produced, being a new composition of iron and silicon which has a much lower core loss and higher permeability than previous compositions and will still further improve the efficiency and reduce the heating of electrical apparatus.

Many improvements were made in X-ray apparatus, of which the two of greatest interest are: a means of passing packaged goods over a source of X-rays so that an operator may detect any foreign matter or any incompletely filled package; and a medical device in which the operator may quickly get an X-ray photograph of the exact part of a person under the exact conditions as he sees it in the fluoroscope. It may be compared to a Graflex camera in which the subject is seen right up to the time the picture is taken.

An "Iron Detector" will detect scrap iron, tacks, nails, etc., in other materials and is used in one of the Federal prisons to detect any firearms being smuggled into the prison.

Household refrigerators have been improved in efficiency so that the 7 cu. ft. size now transfers 550 b.t.u. per hour with a consumption of 30 kw-hrs per month as compared to 340 b.t.u. for 55 kw-hrs in 1927. A "Kitchen Waste Unit" chops and grinds all waste, even bones, to so fine a composition that it may be washed down the drain pipe.

ELECTRICAL MACHINERY. The business of manufacturing electrical apparatus showed a gain in 1935 of 30 per cent over that of 1934 and amounted to \$850,000,000. This gain was largely in appliances for the home and replacements in industrial plants. The output of capital goods in this category has not shown an appreciable increase because of the absence of the Public Utilities from the market, although it is a well known fact that much of the apparatus now in service in this line is in need of replacement and there will shortly be a need for greater capacity.

The 82,500 kilovolt-amperes 180 revolutions per minute generators for Boulder Dam are now in place and soon will be in operation. The 56,000 kv-a 112 r.p.m. generators for the Norris Dam of the TVA are also being installed. These have some novel features in their mechanical construction in order to reduce their height and save headroom for a crane. They are single bearing machines with a drooped, umbrella shaped rotor on the top of a vertical shaft. The pilot exciter is built inside the main exciter and both are on the main shaft. The 36,000 kv-a generators at 85.7 r.p.m. for the Joe Wheeler Dam of the TVA are designed for outdoor operation. These machines are equipped with surface air coolers, a new and growing practice in the design of water wheel generators.

Two 60,000 kv-a 60-cycle synchronous condensers were built for the Los Angeles end of the Boulder Dam transmission. These are the largest so far built, are totally enclosed and operate in an atmosphere of hydrogen for cooling purposes. They will serve to regulate the voltage and power factor at the Los Angeles end of the 287,000 volt, 266 mile line. These machines are designed to act either as a 60,000 kv-a anti-inductive load or as a 36,000 kv-a inductive load when the line is lightly loaded. There are also frequency changer sets for 60,000 kv-a at 600 r.p.m. for interconnecting the 50 and 60 cycle systems in the vicinity of Los Angeles. These machines are also hydrogen cooled. A special feature of the construction is that the two machines of a set have their own independent bearings so that later when the 50 cycle system is changed over to 60 cycle, both machines can operate as independent 60 cycle synchronous condensers at different speeds, because one machine has 10 poles and the other 12 poles. In the Richmond station in Philadelphia a new 165,000 kw turbo-generator was installed in the space originally (1925) allocated to a 60,000 kw generator, showing the improvement in design in 10 years. This set has the greatest capacity of any so far built and the generator has the record efficiency of 98.7 per cent.

A 40,000 kw turbo-generator set to operate at 3600 r.p.m. is also a record breaker for this speed. The steam supply is at 1250 lb. and 925°F and the generator is hydrogen cooled. The steam end is a non-condensing "top turbine" exhausting into an older turbine at a lower pressure.

A new practice has been introduced in the protection of large electric machines by piping them for a supply of carbon dioxide which is kept stored in reserve and may be turned into the machine in case of a fire resulting from a short circuit. On the side of the theory of design and operation of alternating current machines some very interesting new thoughts were brought out in papers presented before the A.I.E.E. on the leakage reactance of synchronous machines as an extension of the Potier method of testing and on the appli-

cation of "Tensors" to the calculation of the performance of machines. This is a form of mathematics using vectors in a very elaborate system. All-metal electron tubes were produced in greater number and variety and in larger sizes and made available to industry both as controllers and suppliers of power. Current up to 25 amperes may be obtained. Mercury arc rectifiers of the pool-type in glass tubes give instantaneous currents up to 5000 amperes for spot welding. That form using the extra electrode dipping into the mercury as an igniter is becoming popular.

There was a considerable increase in the use of the large size mercury rectifiers, for instance for the new New York City Subways. The igniter type is being tried in this size also. In experimental work these pool type rectifiers are being built for 15,000 volts. For Boulder Dam the first of 14 65,000 kw three phase transformers was installed. This is so large that the case had to be shipped in two parts and welded together at the place of installation. The efficiency is 99 per cent. The transformers will operate at 287,000 volts and were tested at 1,650,000 volts. For indoor installation in cities some 500 kv-a transformers were installed using Pyranol instead of oil because it is a non-inflammable and non-explosive liquid with high insulating qualities.

A new type of transformer for rural and farm supply, called a "Rural-line Transformer" was brought out. It is a single phase transformer to be connected between one line of a three-phase transmission to ground and has only one bushing, the other terminal is connected to the tank and this to the solidly grounded neutral of the high tension line. The secondary is a three wire single phase circuit with grounded neutral. Capacitors were improved, particularly by the use of Pyranol as a dielectric and their bulk reduced about 25 per cent for a given rating. As a result capacitor motors for fractional horse power were very much improved. The use of a transformer has been discontinued in some and increased capacity provided for starting, while some capacity is cut out for running conditions.

ELECTRICAL TRANSMISSION AND DISTRIBUTION. The Boulder Dam to Los Angeles 266 mile transmission line at 287,000 volts is going forward rapidly and is having incorporated in it many new features. The Lightning Arresters at one end are of the "Thyrte" type and at the other end of the "Autovale" type. The two types are very similar, consisting of a number of circular discs of a porous material of ceramic base. These discs are made up into units rated at 11,500 volts and 20 of these units are stacked in a column 32 feet long, and connected electrically in series. This column is held together by three strings of suspension insulators and the whole is suspended from above by springs to avoid mechanical shocks such as would result from earthquakes. The electrical connection between successive sections and at the two terminals are made with flexible leads. To protect the line from lightning there is an overhead ground wire with a good electrical connection to the steel of each tower, and the tower itself is connected to a "counterpoise," a network of wires buried several feet under ground and, in general, beneath the power wires. This serves first as a capacity or reservoir to store up the energy from a lightning stroke and also as a good earth connection to let the electricity flow to earth as easily as possible so that the lightning will take this path rather

than along the power wires. To further protect the power wires there are protective gaps across the strings of insulators at about every tenth tower. These gaps discharge the lightning current around the insulators before the potential is high enough to flash over the insulators themselves and the protective gaps are ingeniously designed to clear themselves and open up the gap as soon as the lightning energy has been discharged. This is accomplished in two ways in two different forms: In one the "De-ion" principle is used to quench the arc and in the other the pressure of the gases developed by the arc is used to blow out the arc and clean out the chamber.

The electrical engineer believes that with these three types of protection lightning is no longer a serious hazard in transmission. The unusual circuit breakers for this installation are installed in part and were described in a preceding edition (1934).

The long continued research on lightning has been cumulatively developing new and valuable information. The use of magnetic links has made it possible to measure currents of from 60,000 amperes to 200,000 amperes in the steel structure of towers struck by lightning. It has shown that this current is upward from earth to cloud in about nine out of 10 cases, that is, that negatively charged clouds cause most of the strokes. Other devices show that voltages up to two million have occurred. Other investigations confirm the theory that most lightning discharges are of the multiple stroke type with several successive discharges. At Pittsfield, Mass., an observatory has been erected with a periscope which embraces the whole 360 degrees of the horizon at once and with this many photographs of lightning have been made. Further studies have been made and records taken of the wave-shape of a lightning and surge discharges, including the steepness of the wave-front (rapidity of rise of potential) and length of impulse in microseconds (one-millionth). Now it is possible to classify these by mathematics and reproduce any particular type by means of "Impulse Generators." One of these gives a rise of voltage to three million and then suddenly an auxiliary device sends 150,000 amperes into the circuit.

Much study has been given to "Voltage Recovery Rate" in circuit-breakers on various circuits. This means the length of time required for the voltage across the circuit-breaker to rise from zero, with closed breaker, to full voltage when the breaker is open and the arc has been quenched. This information has been put into practical form for use in predeterminations.

The new system of transmission by direct currents was shown on a small scale at a scientific meeting of the electrical engineers and announcement has been made that a contract has been signed for a line between Schenectady and Spier's Falls, N. Y. The energy will be converted from three phase, constant potential at 40 cycles to 15,000 volts, constant value direct current for transmission and then re-converted to constant potential 60 cycle three phase to be sent into the general 60 cycle system. This first installation is for 5000 kw and will make available commercially the power from an old 40 cycle power station which has lost most of its customers because 60 cycle apparatus has superseded 40 cycle apparatus. The conversion at both ends is accomplished by static rectifiers on the electron principle, in other words, the new metal tubes.

Many installations of "Carrier Current" control were made. By this control distant substations

were operated—switches opened and closed—from a central point by means of radio principles in which the radio frequency currents are sent over the main high voltage power lines simultaneously with the power current. A considerable improvement was made in the "Capacitor Insulator" by which the radio circuit is coupled to the power circuit. Capacitors were improved, reduced in cost and are increasingly used for power factor and voltage regulation on 4400 volt distribution systems.

A new "Totalizing Demand Meter" registers the total demand on several demand meters, each installed on a separate feeder supplying some one large customer. It may be likened to a device which will register in the main office the total number of people entering a theatre by several different entrances.

Much research both ultra-scientific and practical was accomplished on "Dielectrics." The practical side was mostly devoted to the insulation on high voltage underground cables. As a result the losses in the dielectric have been decreased to one fifth of the value common in 1920. A new phenomenon, the variation in power factor of dielectric with increasing radius from the conductor received particular attention and pointed to some features of construction which were undesirable and were corrected in the latest designs, resulting in a longer useful life of a cable because these losses no longer increased excessively with age. An outstanding example of high voltage cables was that of the Pennsylvania R. R., which installed 132,000 volt cables in its tunnels in Washington and Baltimore.

ELECTRIC LIGHT AND POWER INDUSTRY. The principal activity in the electric light and power industry was political rather than technical or economic although there were some important economic advances. The passage by Congress of the Public Utility Act of 1935, better known as the "Wheeler-Rayburn Bill," was the cause of much argument. This law provides for far-reaching changes in organization and management of all public utilities and the dissolution of some of the holding companies. It is being bitterly fought by some of the utilities on the ground of being unconstitutional and confiscatory. Another controversial subject is the increased activity of the Federal Government in building plants to produce electrical energy in competition with the existing privately owned plants. To date, \$589,000,000 has been appropriated by Congress for power projects, most of which (\$400,000,000) was for outright Federal water power plants, and a minor part for state and municipal plants. It was estimated that it will require about one billion dollars to complete the projects already started.

The energy generated by the privately owned central stations was 98,670,000,000 kilowatt-hour with a total capacity of 35,800,000 kw. Deducting from this for the electric railway operations we have for the electric light and power business a generation of 93,575,000,000 kw-hr, and a capacity of 33,900,000 kw. This output is a gain of about 9 per cent over 1934. But most of the increase occurred in the fall when the weekly rate rose to 2,000,000,000 kw-hr per week, which gives much promise for 1936. Of this energy, 77,355,000,000 kw-hr went to the ultimate consumer which is 2 per cent above the previous high in 1929. Among the customers, Wholesale Power took 53 per cent; Commercial 18 per cent; and the Domestic Consumer 18 per cent. This was an increase of 11 per cent in the energy for industrial plants and a 10 per

cent gain for domestic customers. The sale of 1,500,000 refrigerators during the year accounted for part of this and other appliances for the remainder.

The revenue was \$1,923,500,000, a gain of 4.7 per cent over 1934 but still below that of 1929. This shows a decrease in the average rate to 2.5 cents per kw-hr against 2.59 in 1934. Expenses increased so that operating expenses are now 43.7 per cent of income and taxes have risen to 14.2 cents per dollar of revenue.

The number of customers increased 2.1 per cent to 25,300,000 of which 20,000,000 were in the domestic classification including 500,000 new ones. The average bill of a domestic customer increased to \$34 per year but the average rate decreased to 5.07 cents per kw-hr as against 5.40 in 1934. There has been a 7 per cent gain in farm customers to 793,977.

The Federal Power Commission made a report to Congress on the rates charged to residential customers for electric service. This showed a very great discrepancy in the rates varying from about 90 cents for the first 25 kw-hr per month in Cleveland, Ohio to \$2.40 per month in Miami, Florida. For 250 kw-hr per month the charge ranged from \$3.90 in Tacoma, Wash., to \$16 in Westchester County.

Of the energy generated 60 per cent was derived from fuels and 40 per cent from water. This has been a good year for hydroelectric stations because of plentiful rain and showed a production of about 40,000,000,000 kw-hr from a capacity of 10,000,000 kw or a load factor of 45 per cent. Fuel stations had a load factor of 27.3 per cent. The average load factor for the whole industry was 31.5 per cent. Coal consumption per kw-hr was 1.47 lb. as in the previous two years.

The number of miles of Rural Lines is now 302,000, an increase of 7 per cent over 1934. There were 7.6 customers per mile on these lines.

New issues of utility bonds amounted to a little over one billion dollars but only \$26,000,000 was for new enterprises, all the remainder was for refunding older issues at a lower rate of interest. The average interest rate on utility bonds is now at 3.5 per cent. During the year the utilities spent \$237,000,000 for additions and \$93,000,000 for maintenance.

ELECTRIC MARINE ENGINEERING.

The only outstanding achievement in the application of electricity was the actual service of the new French passenger liner, *Normandie*, which finished her maiden trip on June 3, 1935. This vessel has four turbo-electric generators of 40,000 kw capacity each, and four 40,000 h.p. synchronous motors, one on each propeller. Its equipment is the same in capacity as the U.S.N. airplane carriers *Saratoga* and *Lexington*, but differs in the detail that the *Normandie* is driven by synchronous motors and the carriers by changeable speed induction motors. The induction motors permit operation economically at two definite speeds and give better speed control at all speeds, but the synchronous motors are smaller and have a higher efficiency and power factor. By varying the speed of the turbo generator sets adequate speed variation for mercantile service is obtained since speed variation is only necessary while navigating in terminal harbors. During the summer the *Normandie* broke all previous speed records, crossing from Ambrose Lightship to Bishop's Rock, England, 3012 nautical miles in 4 days 3 hours and 28 minutes, showing an average speed

of 30.3 knots. The U.S.S. *Lexington*, with similar electric propulsion machinery, made the run from San Pedro, Calif., to Honolulu, 2226 nautical miles at an average speed of 30.66 knots.

ELECTRIC TRANSPORTATION. The electrification of the Pennsylvania Railroad from New York to Washington was completed and is now in full operation. This includes 58 streamlined, high speed, passenger locomotives of 4620 h.p. each continuous rating, and 1405 miles of electrified track. In addition there are over 100 electric freight locomotives and 431 electrically driven multiple-unit cars. The 225 mile trip is made by the passenger trains in 3 hours and 45 minutes. The locomotive can haul 16 passenger cars at 90 miles per hour. The six 770 h.p. single phase motors weigh 16 lb. per h.p. of continuous rating. The freight locomotives can be used for either freight or passenger trains and can haul a freight train at 50 m.p.h. The Baltimore and Ohio R. R. placed in service a Diesel-electric locomotive of 1800 h.p. to haul its fast trains between New York and Washington. The Atchafalaya, Topeka and Santa Fe has a 3600 h.p. locomotive in two units operating passenger trains over the 2200 mile run between Chicago and Los Angeles. This has four 900 h.p. Diesel-electric generating sets.

Many new lightweight, streamlined, high speed trains were put in service: The Boston and Maine, the Union Pacific 7-car train, the "Zephyrs" of the Burlington. Most of these have one or two 600 h.p. sets but some 1200 h.p. sets are used on locomotives. The new equipment developed by the Electric Railway President's Conference Committee is replacing older style cars on the Brooklyn and Queens and Washington, D. C., lines. This gives an average acceleration of 4.75 m.p.h., twice as much as the older, with just as smooth effect. Dynamic braking makes the stopping quicker and smoother. Each car has four lightweight, spring-born motors with 300 volts on each motor. The motors have double reduction gears and the control is with groups in series-parallel with 23 steps and a transition which avoids the surge at the change from series to parallel. Trolley coaches were added to the existing railways in San Francisco, Dayton, and Cleveland, Ohio. These run on rubber tires, without rails, but take power from a double overhead trolley. A typical car has two 65 h.p. motors and dynamic braking and makes a schedule speed of 13 m.p.h. In San Francisco the braking on the down grade is very important. The "All Service Bus" was introduced. It contains a gas-electric set and operates from overhead trolleys part of its route and when it reaches the end of the electric system it continues on gas power, thus extending the range of service beyond the city limits. Air conditioning of cars on the main line steam railroads continued and furnished quite a business for the electrical industry because of the axle-driven electric generators to supply the power and the electric motors for refrigeration and ventilation. The New Haven, Boston and Maine, Union Pacific, and New York Central, are among the lines adding new equipment of this character.

In foreign countries there were some more main line railway electrifications on a large scale. In Brazil a contract has been let to a British manufacturer for the complete electrification of 91 miles of route comprising double and four track sections with the 3000 volt direct current system with mercury arc rectifiers as a source of the direct

current. In South Africa plans are being completed for a similar 3000 volt direct current enterprise.

ELECTROCHEMICAL SOCIETY. See **CHEMISTRY.**

ELECTRON OPTICS. See **PHYSICS.**

ELMIRA COLLEGE. An institution for the higher education of women in Elmira, N. Y., founded in 1852. The enrollment for the autumn of 1935 was 341. There were 50 members on the faculty. The endowment of the college amounted to \$1,147,248; and the income for the year was \$292,005. There were 44,197 volumes in the library.

President, William S. A. Pott, Ph.D.

EMERGENCY CONSERVATION WORK. See **INDIANS; PARKS, NATIONAL.**

EMIGRATION. See **IMMIGRATION.**

EMORY UNIVERSITY. An institution for higher learning in Atlanta, Ga., coeducational only in the upper division of the college and in the graduate and professional schools (except the school of medicine), founded in 1836. The enrollment for the autumn of 1935 was 1309. The 1935 summer session had an attendance of 620. The faculty numbered 281. The endowment amounted to \$5,769,575, and the income for the year was \$615,000. There were 139,430 volumes in the library. The university operates Emory junior colleges at Oxford, Ga., and Valdosta, Ga., duplicating the work of the first two undergraduate years on the Atlanta campus. President, Harvey W. Cox, Ph.D., LL.D.

ENGINEERING. See **BOILERS; BRIDGES; CANALS; DAMS; ELECTRICAL MACHINERY; FIRE PROTECTION; GARBAGE AND REFUSE DISPOSAL; PORTS AND HARBORS; TUNNELS, ETC.**

ENGINES, INTERNAL COMBUSTION. Under this classification fall gasoline engines, diesel or heavy-oil engines, and gas engines. The gasoline engine is employed principally in the automobile and aviation fields, for motor boats, and for certain auxiliary service. The diesel finds application in small, and to a limited extent in medium-size, stationary power plants, in marine service, and in the transportation field. While a number of large gas engines are still operating on blast furnace gas in steel plants, in recent years the application of this type of prime mover has been confined largely to smaller units operating on natural gas in certain localities, for gas-line pumping and for general power service.

Aircraft gasoline engines have reached a high state of development as to performance, capacity, and weight. Outstanding among the recent engines is the "Wright Cyclone," a nine-cylinder, radial-type, supercharged engine developing 83.4 h.p. per cylinder at 0.48 pounds of gasoline per horsepower-hour. The engine which is rated at 750 h.p. weighs only 1½ pounds per horsepower. See **AERONAUTICS.**

Total sales of diesel engines in the United States during 1934 aggregated 750,000 h.p., while authoritative estimates, based on incomplete figures for 1935, place the sales for the latter year at close to a million h.p. Of these about 3000 engines, mostly under 300 h.p., were installed in stationary power plants.

Diesel Power for June, 1935, contains the accompanying table showing the distribution of diesel capacity built in the United States (see column 2).

The estimated economic life of a diesel, based on several surveys, seems to be about 10 years.

The largest diesel engines built and installed in the United States are the five 7000 h.p. units that were placed in operation two or three years ago in the municipal plant at Vernon, Calif. Units up to

	Use	Horse power
Marine	1,081,400
General industry	973,575
Mobile equipment (excluding railroad)	616,800
Public utilities	606,200
Petroleum industry	535,200
Municipal plants	435,200
U.S. Navy and Coast Guard	274,200
Cotton gins	195,800
Mines and quarries	172,500
Railroads	164,800
Exported	131,600
Ice plants	110,000
Water works	105,400
Irrigation and drainage	104,600
Government institutions	77,500
Buildings	16,800
Miscellaneous	75,000
Total	5,676,575

3000 h.p. capacity are in service in other municipal power plants but, because of certain restrictions and legal proceedings in securing PWA loans, the number of municipal power projects that materialized during 1935 were less than had been anticipated. Small diesels, up to 200 h.p., are becoming strong competitors of purchased power in small manufacturing plants, especially in the non-process industries.

While there have been few recent changes in fundamental design, there have been many refinements in detail and advantage has been taken of metallurgical advances and progress in the welding of frames to reduce weight. Reliability has been stressed in the later designs. Despite predictions of a few years ago, the heavy duty diesel for stationary and marine service has not passed out of the picture, although the trend is distinctly toward lighter weight and the adaptation of higher speed ranges to particular applications. A number of builders are now offering lightweight, high-speed diesels for stationary service up to 200 h.p. and 1800 rpm. Solid injection of the fuel is being employed to an ever increasing extent over air injection. Supercharging, by which the power may be increased up to one-third, is popular abroad but has not been employed extensively in this country. One well-known company is now offering a line of opposed-piston engines.

Within the past few years diesels have become an important factor in the field of transportation, for both railway service and for heavy trucking; but, excepting some experimental work, they have not yet earned recognition in the aviation or passenger automobile fields.

A number of railroads have for some time employed diesel locomotives for yard switching and diesel-electric drive in railcars on short-haul routes. More recently, however, this form of motive power has been applied to cross-country passenger service. Such applications during the year have included units on the New York, New Haven & Hartford, the Gulf, Mobile & Northern, the Santa Fe, and the Baltimore & Ohio. The Chicago & Northwestern and the Burlington had already placed such trains in service and the *Mark Twain Zephyr* of the latter road is reported to have established, on October 23, a short-distance speed record of 122 miles per hour. While there is a definite saving in fuel cost, experience to date has been too limited to offer much data as to maintenance; consequently there still exists considerable difference of opinion as to the relative over-all economy of diesel and steam for fast long-haul service.

The use of diesels in heavy trucks continues to gain favor because of the greater economy in fuel as compared with the gasoline engine. Also some builders have brought out small, lightweight, high-

speed diesels for use in light trucks. These engines range in weight from 9 to 12 pounds per horsepower. In the tractor field diesels appear to be rapidly supplanting the gasoline engine.

In the marine field, improvements in steam practice have reduced the differential in fuel economy as between steam power and diesels. European practice has always favored diesels of larger powers than American practice, but it is significant that most of the more recent large passenger liners are steam propelled. Diesel propulsion is being employed in many of the foreign built cargo ships, tankers, and medium-size passenger vessels, but in this country the application of diesels is being confined mostly to relatively small vessels.

The extensive natural-gas pipe line construction of a few years back has made natural gas available to many sections of the country. This stimulated the use of gas engines for many services. Recent designs trend toward high-speed engines of the vertical type. Some of these are also adaptable to using gasoline.

Gas engines are also employed in a number of cases to produce power from municipal sewage-treatment works. This gas is high in methane and has a heat content of 500 to 800 British Thermal Units per cubic foot. Such installations are to be found at Durham, N. C.; Coney Island, N. Y.; Peoria, Ill.; Springfield, Ill.; Cedar Rapids, Iowa; Janesville, Wis.; Ann Arbor, Mich.; Battle Creek, Mich.; and Washington, D. C. In most cases the power thus derived is employed for pumping and other service around the sewage treatment plant.

ENGLAND, CHURCH OF. In England, that church which is established and endowed by law as the national church. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). (For details of church government, see the *NEW INTERNATIONAL YEAR BOOK*, 1932.) In 1933, there were 2,463,421 Easter communicants in the 43 English dioceses. Incumbents numbered 12,415 and assistant curacies, 4266. There were baptized during the year 381,102 infants and 10,271 persons of riper years. The total voluntary parochial contributions amounted to £6,139,397.

The year of the Royal Jubilee (1935) was notable for remarkable progress and development of church life at home and for the growing influence which the Church exercised in the international sphere as well as on the national life of England. That influence especially made itself felt through a series of weighty pronouncements by the Archbishop of Canterbury, and through some memorable debates in the Church Assembly, the Convocations of Canterbury and York, and the Church Congress. Prominent among the subjects of these pronouncements were the German treatment of the Jews, the Church controversy in Germany, and the Italo-Abyssinian war.

The following two measures were passed by the church assembly in 1935, and received royal assent.

Diocese of Southwell (Transfer) Measure, 1935, restores the Diocese of Southwell, which now forms part of the Province of Canterbury, to its ancient position as part of the Province of York (Royal Assent, Aug. 2, 1935). The transfer actually took place on Oct. 26, 1935.

Farnham Castle Measure, 1935, facilitates the use of part of Farnham Castle as an episcopal residence for the Bishops of Guildford (Royal Assent, Aug. 2, 1935).

The Clergy Pensions (Widows and Dependents) Measure, which was dropped in 1934 was again introduced in a somewhat modified form and it

is hoped that it will be passed and receive the Royal Assent in the early part of 1936. The reorganization and amalgamation of the Ecclesiastical Commission and Queen Anne's Bounty is proceeding slowly, but no very definite steps in that direction are likely to be taken at present.

Among the memorable debates of the year were Peace, the Treatment of the Jews in Germany; the German Church controversy; Clergy pensions; Spiritual Life in the Parishes; the Missionary Work of the Church; Unemployment; Danger on the Public Highways; the Influence of the Cinema; and Nursery Schools.

Work abroad suffered in various mission fields from earthquake, flood, drought, and plagues of locusts, and the war in the Near East increased the difficulties of church work in that area. Nevertheless, there were evidences that the Church overseas was making real advance. The first Bishop of the new diocese of Gambia and the Rio Pongas, reached his field on Ascension Day. In China, Japan, and India, three more Bishops were consecrated from the ranks of the native clergy, and in the new Assistant Bishop of Dornakal, one saw for the first time a European Bishop working under a national diocesan Bishop. The first mission by air was started when the Melanesian Mission sent two pioneer missionaries to the newly-discovered tribes in Central New Guinea.

On the occasion of the King's Silver Jubilee loyal addresses to the Throne were presented by the Convocations of Canterbury and York. The principal subject of debate which came before the Convocations during the year was that of Marriage, which was considered on the Report of the Joint Committee on the Church and Marriage. This Report was still under consideration at the end of the year. Other important reports which were laid before the Convocations dealt with the Relations of the Church of England to the Free Churches, to the Church of Scotland, and to the Church of Finland. Both the Upper and Lower Houses of the Convocations received the Report on Relations with the Free Churches and commended it "to the sympathetic attention and careful study of the Church."

Other subjects which were before either or both of the Convocations included the Report of the Joint Committee on Union and the Laying-on of Hands; the Report of the Joint Committee on "Universities Representation"; Matrimonial Causes; the Transfer of the Diocese of Southwell; the position of Chaplains in public institutions; Licenses under Sea; the Status of Lay Readers; the School-leaving Age; and the Spiritual Welfare of the Deaf and Dumb.

During 1935, though the King's Silver Jubilee outshone all other anniversaries, several notable centenaries took place. Early in the year the twelfth centenary of the Venerable Bede was commemorated at Durham and so was the thirteen hundredth anniversary of the landing of St. Aidan at Lindisfarne. Honor was also paid to the memory of St. Frideswide of Oxford, and "Oswald of Northumbria, Saint and King," whose victory at Heavenfield in 635 A.D., signalized the final triumph of Christianity in the North of England. Another celebration was that of the centenary of the Diocese of Madras, on the Festival of St. Simon and St. Jude, October 28, on the eve of which a Thanksgiving Service was held in Westminster Abbey. The American Episcopal Church also celebrated the 150th anniversary of the conse-

cration of its first Bishop after the War of the Revolution.

The Church Congress was held at Bournemouth from Oct. 8-11, 1935, and was well attended. The general subject was "Christianity in the Modern State" and addresses were grouped under the following subsidiary titles: "What Is Christianity?"; "Grounds for Belief in Christianity"; "Christianity and the Claims of the Modern State"; "Christianity and Communism"; "Church and State in England"; "Christianity and the Relationship between States"; "Education"; "The Family"; and "Life or Death: The Eternal Choice." The Bishop of Winchester presided and the Congress Sermon was preached by the Archbishop of York.

During the year conferences of the various Church organizations again took place. A meeting of the Church Union was held in the Albert Hall on July 11. Lord Halifax presided and the subject was "Is England Christian Still?" The 108th Islington Clerical Conference was held on January 8 at the Church House, Westminster. The Rev. J. M. Hewitt, Vicar and Rural Dean of Islington, presided and the subject was "Grace." The 18th Conference of Evangelical Churchmen was held at Oxford from April 8-10. The subject was "The Gospel of Christ and Present Day Evangelism" and the Rev. C. M. Chavasse presided. The 22d Modern Churchmen's Conference was held at Cambridge from August 26-31. The Very Rev. W. R. Matthews presided and the subject was "The Church of England: Its Constitution, Character and Call." The eighth Cromer Convention was held by the Anglican Evangelical Group Movement from June 22-29. The subject was "The Church in the Modern World" and the leader of the Convention was the Ven. H.St.B. Holland, Archdeacon of Warwick.

Among the outstanding appointments of the year were those of

The Most Rev. H. F. Le Fanu, Archbishop of Perth, to be Primate of the Church of England in Australia and Tasmania
The Rt. Rev. A. J. Maclean, Bishop of Moray, Ross and Caithness, to be Primate of the Episcopal Church in Scotland
The Ven. J. W. Hunkin, to the Bishopric of Truro.
The Rt. Rev. E. J. Bidwell (formerly Bishop of Ontario), to be Assistant Bishop to the Archbishop of Canterbury.
Canon J. L. Barkway, to be Bishop Suffragan of Bedford.
The Rev. H. E. Sexton, to be Coadjutor Bishop of British Columbia
The Rt. Rev. C. C. Watts, to the Bishopric of Damaraland.
The Rt. Rev. P. C. T. Crick (formerly Bishop of Balarat), to be Assistant Bishop to the Bishop of Derby.
The Ven. A. B. Elliott, to be Assistant Bishop to the Bishop of Dornakal.
Canon A. C. W. Rose, to be Bishop Suffragan of Dover.
The Rev. H. G. Bullen, to be Assistant Bishop to the Bishop in Egypt and the Sudan.
The Rev. J. C. S. Daly, to the Bishopric of Gambia and the Rio Pongas.
Canon, A. I. Greaves, to be Bishop Suffragan of Grantham.
The Rt. Rev. E. M. Blackie, to be Bishop Suffragan of Grimsby.
The Ven. Mok Shau Tsang, to be Assistant Bishop to the Bishop in Hong Kong.
Canon S. K. Tarafdar, to be Assistant Bishop to the Bishop of Calcutta, and Metropolitan of India, Burma, and Ceylon.
The Ven. W. Jameson Thompson, to the Bishopric in Iran.
The Ven. Dennis Victor, to the Bishopric of Lebombo.
The Rt. Rev. J. J. Willis (formerly Bishop of Uganda), to be Assistant Bishop to the Bishop of Leicester.
The Rev. P. S. Sasaki, to the Bishopric in Mid-Japan.
The Rev. F. O. Thorne, to the Bishopric of Nyasaland.
The Ven. E. H. Knowles, to the Bishopric of Qu'Appelle.
The Rev. P. Carrington, to the Bishopric of Quebec.
The Rt. Rev. C. A. W. Ayles, to the Bishopric of St. Helena.
The Rev. J. C. Mann, to the Bishopric in South Japan (Kyushu).
The Ven. A. W. Lee, to the Bishopric of Zululand.
Canon W. A. Robins, to be Archdeacon of Bedford.

Canon R. Brook, to be Archdeacon of Coventry.
Canon A. Baines, to be Archdeacon of Halifax.
Canon A. F. Gaskell, to be Archdeacon of Rochdale.
The Very Rev. E. L. Henderson, to be Dean of Salisbury.
Preb. R. L. Hodson, to be Archdeacon of Stafford.
The Rt. Rev. G. A. Hollis, to be Archdeacon of Wells.
The Rev. E. R. Morgan, to be Archdeacon of Winchester.
Canon F. Harrison, to be Chancellor of York Minster.
The Rev. H. Anson, to be Master of the Temple.
The Rev. A. D. Gilbertson, to be Chaplain of the Fleet.

The officers of the church assembly in 1935 were: chairman, the Archbishop of Canterbury; vice-chairman, the Archbishop of York; secretary, Sir Philip W. Baker-Wilbraham; assistant secretary, Guy H. Guillum Scott; chairman of the house of bishops, the Archbishop of Canterbury; chairman of the house of clergy, the Dean of Norwich; chairman of the house of laity, the Earl of Selborne. Headquarters are at 8 Dean's Yard, Westminster, S.W.1, London.

ENGLISH LITERATURE. See LITERATURE, ENGLISH AND AMERICAN.

ENTOMOLOGY, ECONOMIC. The year 1935 was marked in the field of applied entomology by the advance in control and eradication work with insects of major importance made possible by the appropriation and allotment of Federal funds.

Alfalfa Insects. It was shown that the injury to alfalfa by the leafhopper, known as "yellows disease," which has occurred in several States can be satisfactorily and efficiently controlled through a deferred cutting that destroys the immature stages of the insect. The alfalfa weevil spread during the year and was found infesting additional counties in Nebraska, Utah, Arizona, Nevada, California, and Oregon. Investigation in California led to the conclusion that due chiefly to unfavorable climatic conditions the weevil will not become a major pest over most of the alfalfa growing region of that State.

Bark Beetles and the Dutch Elm Disease. Eradication work with the bark beetle-transmitted Dutch elm disease which has invaded the tristate area of metropolitan New York (see NEW INTERNATIONAL YEAR BOOK for 1934, p. 215) and threatens the extermination of this majestic shade tree was pressed with great vigor supported by Federal and State funds, particularly relief funds.

Black Widow Spider. Local cases of poisoning caused by bites of the black widow or hour-glass spider (*Latrodectus mactans*) reported in newspaper and magazine articles and warning the public against it brought this arachnid to widespread attention. It occurs in nearly every State of the Union and south through Central and South America. In its natural habitat the spider is found with its web and egg sacs in protected darkened locations, such as vacant rodent burrows, under stones, logs and long grass, in hollow stumps and brush piles. It takes up its abode in man-made structures including cellars, garages, hen houses, barns, pump houses, and the home. The mature male does not capture prey and as a rule the female is not aggressive unless agitated or exceedingly hungry but when guarding the egg sacs if disturbed is particularly prone to bite. It is present throughout the year but relatively more abundant in the late summer and early fall. The adult female is glossy black to sepia and densely clothed with short minute hairs which give it a naked appearance. An irregular white stripe is sometimes present on the upper front margin of the abdomen. The characteristic hour-glass marking on the under side of the abdomen, rarely altogether absent, varies among individuals from the distinct hour-glass design to a design comprising

two or more distinct triangles or occasionally only an irregular longitudinal area. While the bite itself which is similar to a pin prick is not always felt, the pain, usually in the region of the bite, is felt almost immediately and increases in intensity reaching its maximum in 1 to 3 hours and generally continuing from 12 to 48 hours, gradually subsiding.

Chinch Bug. Reported to have caused a loss of more than 40 million dollars to corn, wheat, and oats in 1934 in Illinois alone the winter was successfully passed by the pest throughout the chinch bug belt. With a special appropriation of \$2,500,000 the Federal Department of Agriculture was prepared to furnish farmers with creosote to use in creosote-rimmed trenches along the edges of corn fields in the Central States to combat the pest. However the cold wet weather in the spring and early summer killed enormous numbers of first-brood bugs in small grains and prevented general outbreaks. A report was made of the development of strains of hybrid corn highly resistant to it and also high in yield and quality of grain.

Codling Moth. The codling moth or fruit worm, the most important pest of pome fruits, was generally less abundant in the eastern United States with a much heavier infestation from Colorado westward. High temperatures resulted in a decided increase in the amount of wormy fruit in the Pacific Northwest, and in the Sacramento Valley of California. The decline in abundance that commenced with the period of excessive heat and drought in 1934 continued, making it possible for growers to reduce worm injury to about what it was previous to the serious outbreak that reached its peak in 1933. The intensive research that has been conducted by Federal and State workers in recent years in an effort to develop a practical substitute for arsenate of lead and avoid an objectionable residue on the fruit was continued. Large-scale tests of various insecticides have shown arsenate of lead to still be the most generally satisfactory material available although not fully effective in the control of severe infestations. Closely approaching it in effectiveness is the nicotine-oil treatment which however involves certain difficulties in practical use. The work that has been carried on in the removal of the objectionable residue from the fruit at harvest time has shown the washing treatment with hydrochloric acid, salt, and light mineral oil in the brush machine to give the highest average efficiency in removal to meet the tolerance requirement, namely, 0.01 grain of arsenic and 0.018 grain of lead per pound of fruit. Work with supplementary control measures has shown a thorough cleaning up and banding of the orchard to reduce the injury to fruit by 30 to 50 per cent and that bait traps will reduce the infestation by about 25 per cent.

Cotton Boll Weevil. Infestations by the cotton boll weevil were generally heavy throughout the cotton belt, it being particularly troublesome in the South Atlantic States. Late fall reports indicated a reduction in the numbers going into hibernation in the Mississippi Valley cotton districts.

Giant Toad Control of Insects. THE. The giant toad (*Bufo marinus*) introduced into Puerto Rico from Barbados in 1920 has increased in such numbers that its food demand upon native white grubs, the most serious and generally destructive enemy of sugar cane and other crops, has reduced this pest to one of minor rank. This toad has since been introduced into the cane fields of Hawaii

where it has increased rapidly and is attacking sugar cane pests.

Grasshopper Pest. The hatching of grasshopper eggs in the Great Plains area was very much retarded by cool wet weather and the infestation in general was not nearly so serious as in 1934 (see NEW INTERNATIONAL YEAR BOOK for 1934, p. 216).

Hessian Fly. This major enemy of the wheat crop—which was at low ebb in 1934—, aided by the drought in the main wheat area, the late summer rains in the East Central States that encouraged growth of much volunteer wheat to harbor a late generation, and the rather general early sowing of wheat, severely infested some areas. The spring brood was unusually heavy in the East Central States with a generally increased population westward to Kansas.

Important New Insects. New insects of economic importance continued to make their appearance. The mealy bug *Phenacoccus aceris* Sig., common in Europe, has made its appearance in the apple orchards of Nova Scotia and become a source of damage through the resulting growth of a sooty fungus on the surface of the fruit. The larch sawfly (*Lygaeonematus erichsonii* Htg.) not previously recorded west of the Mississippi river was discovered in northern Montana and threatens the larch stands in the upper Rocky Mountain region. Well-established infestations of the white spruce sawfly (*Neodiprion polytomum* Htg.), a European pest, have been located over a considerable area in Maine, New Hampshire, and Vermont. A weevil enemy of the pepper plant in Cuba (*Cryptorhynchus cubae* Boh.) has made its appearance in southern Florida and already become a serious enemy of this crop. The cherry scale (*Aspidiotus forbesi* Johns) was found for the first time in California, attacking pears near Sacramento. A new mite (*Neotetranychus buxi* Gar.) was discovered attacking the foliage of boxwood in Michigan. The willow weevil (*Mimetus uniformis* Casey) introduced into deciduous fruit orchards near Sebastapol, California, on willow props attacked the apple and other fruits causing a loss in several areas of more than 50 per cent of the crop. The black wheat-stem sawfly (*Trachelus tabidus* (Fab.)) has appeared in wheat fields in Ohio where it is causing considerable loss. The alfalfa snout beetle (*Brachyrhinus ligustici* Linn.), a serious pest of alfalfa and clover in Europe, has become established along the shore of Lake Ontario in New York and completely destroyed entire fields of alfalfa on several farms and caused severe injury on many others. The tropical rat mite (*Liponyssus bacoti* Hirst), known to transmit endemic typhus, was discovered to occur in the St. Louis area of Missouri. The tomato pin-worm (*Gnorimoschema lycopercella* Busck), first found in California in 1922 injuring tomatoes, has appeared in several eastern States—particularly in green houses.

Mexican Bean Beetle. The emergence of the Mexican bean beetle took place two weeks later than usual in the New England and Middle Atlantic States; by the end of June it was generally destructive throughout its range. Heavy infestations were reported in August from practically its entire known range, which was extended northward in Vermont and Michigan and westward in Tennessee and Iowa.

Mosquito Control. A new larvicide for use in combating the mosquito was developed in New Jersey. It quickly destroys all "wigglers" with

which it comes in contact, is non-poisonous to the higher animals and man, is not injurious to water plants, and is cheap enough to render its use practical. This larvicide consists of a mixture of light petroleum oil and pyrethrin, an extract from pyrethrum flowers which have long been used in the making of Dalmatian insect powder. The addition of the pyrethrin to the oil so increases its effectiveness that four or five gallons will produce as large a killing film as was formerly obtained from 35 to 40 gallons. With the addition of a little soap a perfect emulsion can be made with ten or twelve times its bulk of water. Although protected by a patent against commercial monopoly no restriction is placed on its use. Experiments with this mixture have demonstrated that when applied as a fine mist by means of a sprayer it spreads over the soil and vegetation, to which it clings closely for several hours, acting as a repellent to adult mosquitoes. In this way outdoor gatherings such as carnivals, picnics, open air theatres, lawn parties, and open porch gatherings can be partially or completely and economically protected for periods of from two to four hours. In work aimed at the destruction and prevention of the dissemination of mosquitoes by aeroplanes a concentrated oil extract of pyrethrum flowers containing two grams of pyrethrin per 100 cc. was found highly effective against the yellow fever mosquito (*Aedes aegypti*) when applied as a very fine spray. Mosquitoes fumigated with the pyrethrum extract did not die at once.

Oriental Fruit Moth. This major enemy of the peach, quince, and apple appeared to be decidedly on the increase from the East Central States southward to Tennessee and Mississippi. It was scarce in the Eastern States and much less abundant in the Ontario Niagara District than in 1934. Some damage was caused in southern New Hampshire and it appeared for the first time in western Missouri at St. Joseph.

Pink Bollworm. Outstanding in the pink bollworm situation was (1) the finding of infestations in several additional counties in Northern Florida and three in western Texas, (2) no recurrence in the original infested areas of Florida and Georgia, and (3) continued progress in the eradication of wild cotton which serves as a host in southern Florida. On December 5 all parts of Georgia included in the regulated area were released from restrictions, the eradication work having proved successful. In aeroplane collections in the Big Bend area along the Rio Grande in Texas moths of the pink bollworm were taken as high as 3000 feet above the ground level and trap plots of cotton located 25 to 65 miles from the nearest cotton field became infested in five of the six years studied indicating that the moths fly or are carried involuntarily by the wind for considerable distances.

Screw Worm. The screw worm, the maggot or larval stage of a fly (*Cochyliomyia americana*) that resembles but is much larger than the common house fly, is a parasite of warm-blooded animals, infesting wounds on any part of the body. It destroys animal flesh and produces a substance that is poisonous to the infested animal. Unless treatment is administered the maggots, which produce a condition that attracts other flies to lay their eggs, enlarge the wounds and go deeper until they reach a vital organ or open the body cavity and cause death. The present outbreak of this pest in the Southeastern States dates from the summer

of 1932 when it first appeared in considerable numbers. During 1933 and 1934 there were 875,000 cases in Georgia alone of which 75,000 resulted fatally causing livestock owners a loss estimated at \$2,500,000. This enormous loss led to a Congressional appropriation of \$480,000 that was used during the year to carry on a campaign in which officials of the Federal government and of seven Southeastern States cooperated. Part of the fund was used in instructing farmers and ranchers how to protect stock, part for the purchase of benzol and pine tar oil for treating infested animals as well as material for building pens and chutes in which animals are held during treatment and part in the search for cheaper and more effective control measures. Carried in infested cattle and sheep shipped north to be fed in the Corn Belt the screw worm appeared in Kentucky, Illinois, Missouri, Kansas, and Iowa, there having been more than 7000 cases reported resulting in a loss of 4000 animals in Illinois alone. Lacking the resistance to cold it is not expected to survive the winter in the Corn Belt.

Sugar-Cane Moth-Borer. The sugar-cane moth-borer, the most important pest with which the sugar cane planters of the South have to cope, suffered a high mortality as a result of the severe freeze that visited the sugar-bowl area of Louisiana late in January. An examination made a month later indicated that an average mortality of 90 per cent of the overwintering larvæ had resulted. A similar heavy mortality followed heavy freezes in the Beaumont area of Texas.

Bibliography. Works of the year on entomology include: A. Balachowsky and L. Mesnil, *Les Insectes nuisibles aux plantes cultivées*, (Paris, 1935, vol. 1); H. T. Fernald, *Applied Entomology: An Introductory Text-Book of Insects in Their Relations to Man*, (New York and London, 1935, 3d ed., rev.); V. R. Haber, *A Laboratory Guide for Use in Forestry Entomology*, (Ann Arbor, Mich., 1935); C. C. Hamilton, *Entoma: A Directory of Insect Pest Control*, (New Brunswick, N. J., 1935); G. W. Herrick, *Insect Enemies of Shade Trees*, (Ithaca, N. Y., 1935); F. E. Lutz, *Field Book of Insects*, (New York, 1935, 3rd ed., rev. and enl.); A. I. and E. R. Root, *The A.B.C. and X.Y.Z. of Bee Culture*, (Medina, Ohio, 1935, rev. and enl. ed.); R. E. Snodgrass, *Principles of Insect Morphology*, (New York and London, 1935); T. E. Snyder, *Our Enemy the Termite* (Ithaca, N. Y., 1935).

EPIC MOVEMENT. See CALIFORNIA.

ERITREA, ər'ê-trā'a. An Italian colony in northeast Africa. Area, 45,754 sq. miles; population (1931), 621,621 including 4565 Italians. Chief towns: Asmara (capital), 22,101 inhabitants; Massawa, the main port, 4154 inhabitants.

Production and Trade. Potash, skins, pearls, and salt were the main products. In 1933, imports by sea (Massawa) and land totaled 200,297,943 lire; exports by sea (Massawa) and land, 81,825,983 (lire averaged \$0.0667 for 1933). Steamships entering Massawa in 1933 totaled 579,471 tons.

Government. The budget for 1934-35 was estimated to balance at 64,784,847 lire. Revenue included state contributions of 41,250,000 lire. Expenditure included 23,082,000 lire for military purposes. The colony was administered by a civil governor (nominated by the King) under the direction of the Italian Minister for the Colonies. See ETHIOPIA under History.

ESSENTIAL HYPERTENSION, SURGICAL TREATMENT OF. See MEDICINE AND SURGERY.

ESTONIA. A Baltic republic, established Feb. 24, 1918. Capital, Tallinn (Reval).

Area and Population. With an area of 18,358 square miles, Estonia had an estimated population in 1935 of 1,127,885 (1,126,413 at 1934 census). The urban population was 349,826. Living births in 1934 numbered 17,298; deaths, 15,889; marriages, 8958. The census populations of the chief cities in 1934 (1922 census figures in parentheses) were: Tallinn, 137,792 (122,419); Tartu, 58,876 (50,342); Narva, 23,512 (26,912).

Education. Elementary education is free and compulsory. The illiteracy rate among persons 10 years of age and over in 1934 was 3.9 per cent. Enrollment in primary schools in 1931-32 was 109,414; secondary schools, 13,258. Tartu University had 2842 students in 1933.

Production. About 70 per cent of the population are engaged in agriculture and dairying. Production of the chief crops in 1934 was: Wheat, 3,107,000 bu.; rye, 9,064,000 bu.; barley, 5,277,000 bu.; oats, 10,994,000 bu.; potatoes, 32,779,000 bu.; flax fibre, 15,618,000 lb. Livestock statistics (1934) were: 646,250 cattle, 552,070 sheep, 281,660 swine, 215,510 horses. The chief manufacturing industries are engaged in the production of textiles, paper, cement, oil from shale, wood products, flax, and leather. On Sept. 1, 1934, there were 38,156 industrial employees.

Foreign Trade. Imports for consumption in 1934 were valued at 55,275,000 Estonian crowns (39,030,000 in 1933) and exports at 68,973,000 crowns (45,558,000 in 1933). In 1934 Germany supplied 21.2 per cent of the value of all imports; United Kingdom, 16.4; and the United States, 10.4 per cent. Of the exports, the United Kingdom took 40.4 per cent; Germany, 22.5; and the United States, 2.3 per cent. Leading 1934 exports, in order of value, were butter, lumber, wood pulp, cotton cloth, and meat products. Leading imports were raw cotton, machinery, iron and steel, cotton fabrics, wool yarn, and fertilizers.

In 1935 imports totaled 68,757,000 crowns; exports, 80,118,000 crowns.

Finance. Budget estimates for the fiscal year ending Mar. 31, 1936, balanced at 77,700,000 crowns, including supplementary budgets, as against 74,581,000 crowns in 1934-35. Final returns for 1933-34 showed current receipts and expenditures of 63,603,000 and 61,121,000 crowns, respectively, and capital receipts and expenditures of 1,821,000 and 4,069,000 crowns, respectively.

The public debt on Mar. 31, 1935, was divided as follows: 20,107,000 U. S. dollars, 1,714,000 pounds sterling, 8,062,000 Swedish crowns, and an internal debt of 15,866,000 Estonian crowns. The crown (par value, after January, 1934, \$0.4537) exchanged at an average of \$0.2624 in 1933 and \$0.2719 in 1934.

Communications. Estonia in 1934 had 899 miles of railway lines. Air lines connected Tallinn with various cities of northern Europe. The merchant marine on Jan. 1, 1934, included 110 steamers, 22 motor ships, and 240 sailing vessels, with a total tonnage of 130,615 tons. Tallinn is the chief port. In 1934 the net register tonnage of vessels in the overseas trade entering the ports was 942,000 (885,000 in 1933).

Government. The Constitution of Jan. 24, 1934, established an authoritarian régime in which the President was given wide powers. It also provided

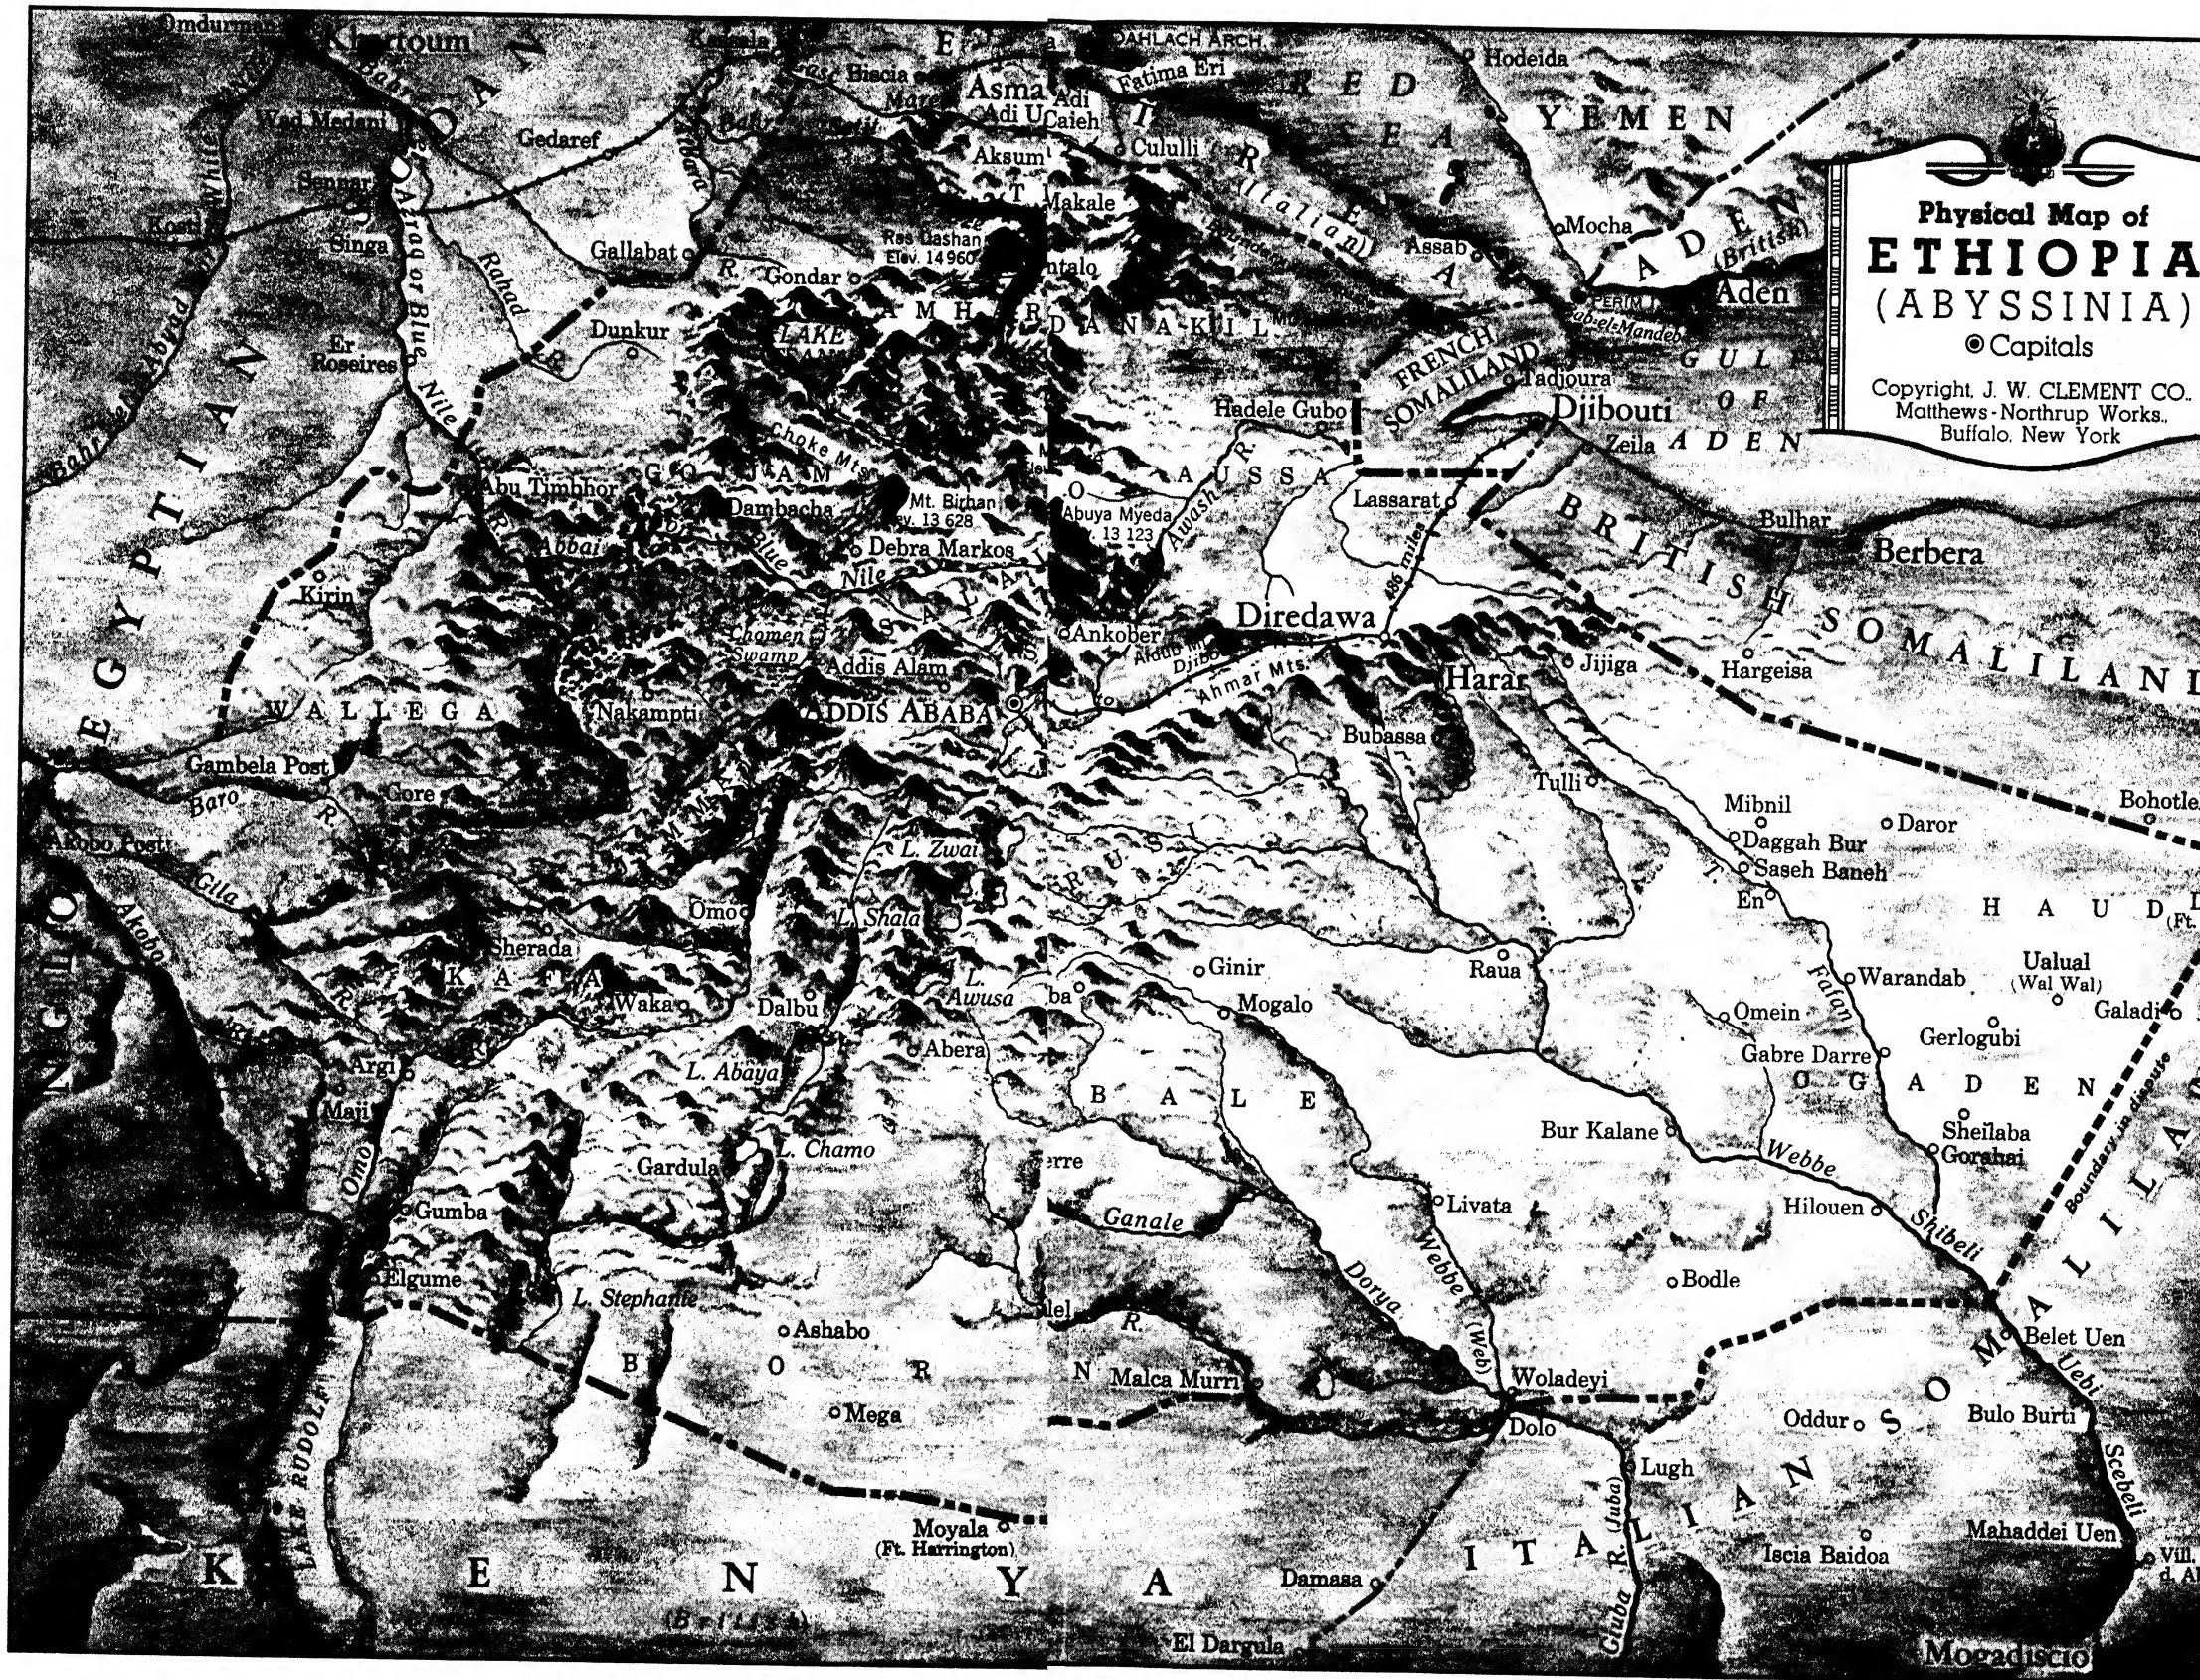

for an Assembly of 50 members chosen for four years by direct suffrage. On Mar. 19, 1934, however, Acting President and Premier Konstantin Pats and his non-party cabinet declared martial law and established a dictatorship which continued through 1935. See *History* for developments in 1935.

History. Internal Affairs. The dictatorship declared Mar. 12, 1934, by Konstantin Pats, Acting President and Premier, in collaboration with Gen. John Laidoner, commander-in-chief of the Army, and Minister of Interior Karl Einbund, ruled Estonia throughout 1935. The menace of a Fascist coup d'état had provided the occasion for the establishment of the dictatorship (see 1934 YEAR BOOK, p. 218), and Fascist conspiracies during 1935 gave the triumvirate an excuse for the continuance of its unconstitutional régime. In order to "liberate citizens from party strife" the dictatorship on Mar. 6, 1935, banned all political parties and prohibited all meetings, speeches, and articles of a political nature. On March 9 the one-party system was established in the form of a so-called Fatherland Front, based upon the Acting President's agrarian following. All other political groups were declared illegal.

On June 21 a Tallinn court-martial convicted 37 members of the Fascist group known as the Liberators, or Front Soldiers' League, who were arrested for conspiring against the government at the time the dictatorship was established. Fourteen defendants, including Gen. Anders Larka, the Liberators candidate for President in 1934, were sentenced to a year's imprisonment, while 23 received shorter terms. Apparently the sentences were commuted in part later. In July the country's oldest newspaper was placed under censorship as a result of its criticisms of the dictatorship's activities and in August the government announced plans for the drafting of a new Constitution to legalize its position.

The Liberators and allied Fascist groups, with apparent support from Fascists in Finland and Germany, planned another coup d'état against the government which was nipped in the bud on December 7-8. Police raided a secret meeting of the conspirators near Tallinn, arrested some 20 ring-leaders including General Larka, and seized documents which they said contained complete plans for a revolutionary uprising on December 8. Arrests continued for more than a month, and at the end of the year it was estimated that some 700 persons were in prison accused of complicity in the conspiracy. Alarmed by the widespread opposition, the government indicated that it was considering an early return to constitutionalism and to at least partially representative government.

In the economic field the government was more fortunate. The substantial recovery from the depression inaugurated in 1934 continued during 1935. Industrial activity exceeded that of 1929 and there were only 200 unemployed workers in the country at the end of September. The government accordingly announced the suspension of relief work during the coming winter. While agriculture had not recovered to the same extent as industry, farm prices were higher and farm purchasing power had risen considerably over the low level of the depression. Encouraged by the success of its economic policies, the government in September announced the extension and partial revision of its economic programme. Further entry of the government into the field of private

enterprise and further nationalization of industry were the major trends indicated.

External Affairs. As a member of the Baltic Entente (q.v.), Estonia was represented at the conferences held by Estonia, Latvia, and Lithuania at Kaunas on May 6-8 and at Riga on December 9-11. At both conferences the three states reaffirmed their political solidarity, considered measures for securing representation on the League Council, and took preliminary steps towards their eventual economic union, particularly the coordination of their agricultural and industrial production and the elimination of export competition. However some observers saw strong divisive tendencies within the Entente, with Estonia leaning toward Poland, Latvia toward Germany, and Lithuania toward the Soviet Union. Close co-operation between the Finnish and Estonian government in military matters became evident toward the close of 1935. General Laidonner, the Estonian commander-in-chief, visited Finland in October.

See LATVIA and LITHUANIA under *History*.

ETHIOPIA. An empire of East Africa. Capital, Addis Ababa. Emperor in 1935, Haile Selassie I.

Area and Population. Ethiopia has an area of about 347,500 square miles and a population variously estimated at from 5,000,000 to 10,000,000. The Abyssinians, the ruling race, are Christians of Hamitic origin. They number less than 3,000,000. The other chief tribes are the Gallas, Somalis, Afar, Arussi, Ogaden, and Danakil, which are mainly Moslem or pagan, but comprise a few Christians. The Christians have a Coptic Abuna, or head bishop, through whom they are connected with the Alexandrian Church. The Christians dwell mainly in the region bounded by Addis Ababa on the south and the frontier of Eritrea on the north and extending west of lake Tsana. Estimated populations of the chief cities are Addis Ababa, 60,000 to 70,000; Harar, 40,000; Dire Dawa, 30,000. Adowa, the capital of Tigre Province; Debra Markos, capital of Gojjam, and Aksum, the ancient capital and holy city of Ethiopia, have about 5000 inhabitants each.

Production. Stock raising and primitive agriculture are the chief occupations. The principal crops are coffee, cotton, sugar cane, dates, grapes, barley, millet, wheat, and tobacco. Coffee exports totaled about 12,500 metric tons in 1933-34. Cattle, sheep, goats, mules, donkeys, and, in some regions, camels are raised. Mining is carried on in a small way, the chief minerals being iron, gold (124 kilograms exported in 1931), platinum (about 207 kilograms in 1933), and potash salts. Coal, copper, sulphur, and oil deposits are reported to exist but the true extent of the mineral resources remained problematical in 1935.

Foreign Trade. Available foreign trade statistics cover only the main trade routes through Djibouti, the Anglo-Egyptian Sudan, and British Somaliland. In 1934 the imports and exports over these routes were valued at 1,009,451 and 963,917 £ sterling, respectively. About 80 per cent of the total trade passed over the French-controlled railway from Addis Ababa to Djibouti. The principal imports were salt, cotton sheetings and other textiles, building material, sugar, and glassware. The bulk of this trade was in Japanese hands. Coffee, hides and skins, wax, civet, and native butter were the chief exports.

Finance. Government revenues in normal times were estimated at from \$5,000,000 to \$7,000,000 annually, the bulk representing payments in kind.

Barter was the prevailing method of trade, but the Maria Theresa silver thaler (dollar) was the chief monetary unit. Violent fluctuations of the thaler caused by the rise in silver prices in 1935 led the government to stabilize the bank exchange rate artificially at 2.75 Maria Theresa thalers to the American dollar. The former Bank of Abyssinia, enjoying a banking monopoly of the country, was taken over by the state in 1931 and reorganized as the state Bank of Ethiopia.

Communications. The only railway in the country is the French-owned line extending 487 miles from Djibouti to Addis Ababa. By the Franco-Italian agreement of Jan. 7, 1935, Italy received 2500 out of the 34,000 shares in the railway company. In 1935 there were 2730 miles of roads of which about 65 miles were macadam, 1200 miles were of earth or gravel, and the remainder were mere trails. There were 383 automobiles in the country. Telegraph lines extended from Addis Ababa to Massawa in Eritrea. Telephone lines, linking the capital with the chief Ethiopian cities and with Djibouti and Massawa, aggregated about 5113 miles.

Government. Ethiopia remained an absolute monarchy of the feudal type until July 16, 1931, when the Emperor proclaimed a constitution establishing a unified state with two nominated assemblies to advise the Emperor's government. The first parliament, which convened in November, 1932, consisted of a Senate of 27 members chosen from hereditary chiefs of the various provinces and a Chamber of Deputies of about 40 members named by the Emperor from minor military officers and provincial leaders. There was an Imperial Council, divided into a Supreme Council (the Emperor and two princes), a Council of (10) Imperial Advisers, and the officers of the Court. The Emperor acted as his own Prime Minister.

HISTORY

The threatening developments between Italy and Ethiopia in East Africa during 1934 (see 1934 YEAR BOOK, p. 219) proved to be the prelude to a mighty drama which involved not only the independence of Ethiopia and the stability of the Fascist régime in Italy but also the fate of the League of Nations and the future of Europe. The year 1935 witnessed the completion of Mussolini's diplomatic and military preparations for the conquest of Ethiopia; the efforts of the League powers, led by Britain, to check Italy; the launching of the Italian attack on October 3 and the accompanying Anglo-Italian crisis in the Mediterranean; and the application for the first time in history of the economic and financial sanctions provided for in Article XVI of the League Covenant against an aggressor nation. The outcome of these developments was still in doubt at the close of the year. But already Mussolini's Ethiopian adventure had precipitated the realignment of diplomatic and military forces throughout Europe. It seemed evident that that harassed continent had been launched upon a path which might lead either to the consolidation of peace on the basis of collective resistance to aggression or to another Armageddon.

Preparations for War. Diplomatic preparations for Italy's attempted seizure of Ethiopia date from the Treaty of Ucciali of 1889 between Italy and the Emperor Menelik. On the basis of this treaty Italy announced that it had established a protectorate over the black empire. The attempt to enforce this claim was shattered by Menelik at the Battle of Adowa in 1896. The Rome Govern-

ment did not renounce its interest in Ethiopia, however, and in a series of agreements with France and Great Britain marked out a sphere of influence there which it was to occupy in the event of the breakup of the native empire. The most important of these understandings were the Tripartite Agreement of 1906; the secret Treaty of London of 1915 by which Italy was promised compensation in Ethiopia and other parts of Africa for joining the side of the Allies in the World War; and the Anglo-Italian agreement of 1925. Meanwhile Mussolini had strongly supported Ethiopia's admittance to the League of Nations in 1923 against British objections. In 1928 he concluded a 20-year pact of friendship and arbitration with Ethiopia, a supplementary convention to which authorized Italy to construct a motor road from Dessie in northeastern Ethiopia to the Italian port of Assab in Eritrea.

Throughout this period the imperialistic rivalries of France, Britain, and Italy in Ethiopia had proved an even more potent bulwark of Ethiopian independence than the obstacles to foreign aggression interposed by the rugged terrain, the climate, and the fighting spirit of the native tribes. French guns and ammunition had helped to defeat the Italians at Adowa. Each move by any one of the three rival powers to obtain a predominant position in Ethiopia had been checkmated by the others. But by the beginning of 1935 the way seemed open for Italy to move without great danger of arousing the opposition of either France or Great Britain. A series of Anglo-Italian conventions, culminating in that of 1925, had recognized Italy's prior claims over practically all of Ethiopia except the region around Lake Tsana where rise the headwaters of the Blue Nile. Then on Jan. 7, 1935, France and Italy, obsessed by a common fear of resurgent Germany, buried their mutual enmities and struck a bargain under which Italy received territorial and other compensation in North and East Africa in return for her support of French policy in Europe.

The only agreement concerning Ethiopia that was made public was the concession to Italy of 2500 out of the 34,000 shares in the French-owned Djibouti-Addis Ababa railway. Subsequent events appeared to substantiate the widely-published charge that Mussolini and Foreign Minister Laval at their Rome meeting reached a secret understanding which was interpreted by Il Duce as giving him a free hand in Ethiopia. M. Laval denied before the Foreign Affairs Committee of the French Chamber on June 19, 1935, that he had made such an agreement. But in the meantime Mussolini had decided to gamble the future of his régime on a campaign to subdue Ethiopia, confident that the perilous state of Europe, if not his understandings with Britain and France, would prevent any effective interference with his plans. It was clear that he anticipated nothing more significant than moral protests from the League of Nations and the signatories of the Kellogg-Briand Pact, although under both of these peace pacts Italy was bound to respect Ethiopian independence and to use nothing but peaceful means in the settlement of disputes with the African empire.

As early as July, 1934, Mussolini had sent Marshal Pietro Badoglio and an Italian military commission to Eritrea to report on the prospects for an invasion of Ethiopia. In the last months of 1934, Italian reinforcements and war material for the colonial forces in Eritrea and Italian Somali-

land began to flow through the Suez Canal. Evidently by Jan. 7, 1935, when the Franco-Italian agreement was concluded at Rome, the preparations for an Ethiopian campaign were already well under way. On Jan. 16, 1935, Mussolini transferred Gen. Emilio de Bono, the Minister of Colonies and a strong advocate of expansion in Ethiopia, to the newly created office of High Commissioner for Italian East Africa. Thereafter the movement of troops to East Africa swelled rapidly, a hospital and supply base was developed on the island of Rhodes, and the construction of barracks and military highways in Eritrea and Somaliland was speeded up. With the cessation of the rains in Ethiopia, everything was ready for the great offensive of October 3.

The Ualual Incident. Meanwhile a pretext for the Italian invasion had been found in the clash of Dec. 5, 1934, between Italian colonial troops occupying Ualual in Ogaden and the Ethiopian military escort of an Anglo-Ethiopian boundary commission. Ethiopia charged that the Italian troops had occupied Ethiopian territory and precipitated hostilities, but offered to arbitrate the dispute in accordance with the Italo-Ethiopian arbitration treaty of 1928. Italy declared that Ualual was in Italian Somaliland. It asserted that the clash there was "the most recent of a lengthy series of attacks carried out . . . with a view to disputing, by means of threatening acts, the legality of the presence of Italian detachments in certain frontier localities." Demanding reparation for this "unexpected aggression," Italy refused to submit the dispute to arbitration. The Ethiopian Government replied that Italy was pursuing a policy of gradual encroachment on the Ogaden (southeastern Ethiopian) frontier. On Jan. 3, 1935, it placed the dispute before the League Council by invoking Article XI of the Covenant.

On January 29 a new clash occurred at Afduh, near Ualual, in which five native soldiers of the Italian forces were killed. Mussolini then mobilized two regular army divisions on February 10 and announced several days later that Italy was prepared to spend \$850,000,000 in a two-year campaign to obtain "complete satisfaction" from Ethiopia. It was claimed that these preparations were for the defense of the East African colonies against Ethiopian raids and that they were inspired by the "aggressive spirit" displayed by Emperor Haile Selassie and his subjects. Ethiopia immediately requested the League to take steps to halt these military preparations.

The Efforts at Settlement. The period from January to October was marked by feverish Ethiopian efforts to secure outside help in checking the anticipated Italian invasion. At the same time Italy strove unceasingly to prevent the intervention of third parties in the dispute. The negotiations which preceded the outbreak of war in October took various forms. First of all the commission of conciliation and arbitration provided under the Italo-Ethiopian treaty of 1928 attempted to settle the responsibility for the clash at Ualual. After many delays and obstructions by the Italian members, the commission was finally constituted under pressure of the League Council and on September 4 unanimously reported that neither Italy nor Ethiopia was responsible for the incident. The action of this commission had little significance other than serving as an excuse for the postponement of action by the League of Nations while Italy completed its military preparations. Its report forced Italy to withdraw its

claims for an apology and indemnity for the Ualual incident. But Italy at no time considered canceling her more ambitious demands upon Ethiopia.

By far the most important negotiations for a settlement were carried out by the League Council or by Britain, France, and Italy acting on behalf of the Council. These negotiations are described in detail in the article LEAGUE OF NATIONS (q.v.). It suffices here to summarize the most important steps taken to secure a settlement through the League. Despite repeated Ethiopian pleas for action and the invocation of Articles X, XI, and XV of the Covenant, the League Council declined to intervene until May 25, when it formally assumed jurisdiction over the dispute, although leaving the negotiations to the Italo-Ethiopian Conciliation Commission. It took no action to halt Italy's war preparations, nor did it heed Ethiopia's request of June 20 that it send neutral observers to watch developments on the Ethiopian-Italian frontiers.

Late in June Britain made a single-handed effort to satisfy Mussolini's ambitions. She proposed the cession to Ethiopia of the port of Zeila in British Somaliland in compensation for Ethiopian concessions to Italy of tracts for the developments of cotton and coffee plantations and the right to build a railway through Ethiopia linking Eritrea and Italian Somaliland. Mussolini rejected the offer, however. Accordingly the Council on July 25 delegated Britain, France, and Italy to negotiate a new settlement. Representatives of the three governments met in Paris from August 14 to 18. The French and British members drew up a plan giving Italy a predominant economic position in Ethiopia subject to Haile Selassie's consent and the political control of the League of Nations. France and Britain were to subscribe a loan for the economic development of Ethiopia and Italy was to carry out the projects agreed upon and to nominate foreign advisers and administrators at Addis Ababa. Rejecting this proposal, Mussolini demanded outright annexation of the Ethiopian lowlands, a protectorate over the remainder of the country, and the military occupation and disarmament of all Ethiopia to guarantee the security of the adjacent Italian colonies.

By the time the Council reconvened on September 4, 200,000 Italian troops had been concentrated in East Africa at a financial cost which definitely committed Mussolini to carry forward his adventure. The Italian representative informed the Council that his government reserved "full liberty to adopt any measures that might become necessary to ensure the safety of its colonies and to safeguard its own interests." Urgent Ethiopian requests for the application of Article XV of the Covenant led the Council on September 6 to appoint a committee, on which Spain, Britain, France, Poland, and Turkey were represented, to study new proposals for a settlement. On September 18 the committee submitted another plan for League assistance to Ethiopia under which Italy would be assured of economic opportunities there as well as of the security of her citizens in Ethiopia and of her adjoining colonies. Supplementing this plan, the French and British representatives announced that their governments were prepared to recognize "special Italian interest in the economic development of Ethiopia" and to assist territorial adjustments between Italy and Ethiopia by granting Ethiopia territories on the Somaliland coast, which would afford her an outlet to the sea.

The committee's suggestions were accepted by Ethiopia as a basis of negotiation but were rejected by Italy. On September 28 Emperor Haile Selassie, in view of the continual dispatch of Italian reinforcements and other preparations, proclaimed general mobilization. On October 3, coincident with the invasion of Ethiopia, Italy informed the Council that "the warlike and aggressive spirit in Ethiopia had succeeded in imposing war against Italy. . . ." The Council thought otherwise. On October 7 it formally proclaimed Italy the aggressor and inaugurated steps leading towards the application of economic and financial sanctions. See LEAGUE OF NATIONS.

During these months while the war was being hatched, Haile Selassie made several moves to secure the aid of other powers in frustrating Mussolini's ambitions by offering them attractive concessions. On May 10, 1935, he invited the British, Egyptian, and Anglo-Egyptian Sudan governments to attend a conference at Addis Ababa for the purpose of concluding an agreement for the construction of a dam at Lake Tsana. Such an agreement, enabling regulation of the flow of the Blue Nile in a manner highly beneficial to the Sudan and Egypt, had long been sought by Britain. It now favored postponement of the conference in order not to irritate the Italians during such a critical time. Nevertheless it was reported from Cairo on June 1 that an agreement for the construction of the Tsana dam had been virtually completed. In fact the Egyptian Cabinet on May 22 approved an appropriation for construction of the Tsana barrage.

A similar motive undoubtedly inspired the Emperor's concession to the British promoter, Francis M. Rickett, of the exclusive right to exploit oil and mineral deposits throughout 150,000 square miles of territory in Ethiopia, most of it in regions threatened by Italian invasion. The disclosure of this concession on August 30 proved a boomerang, tending to discredit and weaken British opposition to Italian aims until it was revealed on September 3 through Secretary of State Hull that the real owner of the concession was the American-controlled Standard-Vacuum Oil Company. The latter concern promptly canceled the concession when its connection with the affair was revealed.

Another move made by the Emperor in his efforts to balk Mussolini was his appeal of July 4 to the U.S. Government to call to the attention of Italy its obligations under the Kellogg-Briand Pact. Secretary Hull on July 12 replied that the anti-war pact "was no less binding now than when it was entered into" and that the United States and other signatories were "interested in the maintenance of the pact and the sanctity of international commitments assumed thereby." But he made no immediate representation to Italy, although on July 13 the State Department advised the 125 American citizens in Ethiopia to be ready to leave the country on short notice.

The Military Campaigns. The Italians launched their invasion of Ethiopia from three widely separated bases. Their main army under Gen. Emilio de Bono, based upon Asmara in Eritrea, crossed the Mareb River and advanced southward upon Adowa and Makale, from which towns a rough road led southward through Dessey to Addis Ababa. A second drive was begun from Mount Mussa Ali near the border of Eritrea and French Somaliland. Faced by the terrible Danakil desert and its fierce tribesmen, this cam-

paign made little headway and up to the end of 1935 played an insignificant part in carrying out Italian aims. On the southern front two Italian divisions under Gen. Rodolfo Graziani advanced from Ualual and Gerlogubi with the object of taking Harar and cutting the Djibouti-Addis Ababa railway. They were supported by a small detachment at Dolo on the Webbe Mana near the Kenya boundary.

Realizing that mass attacks upon the heavily armed Italians would be suicidal, Emperor Haile Selassie made no effort to bring the war to an early issue. His commanders retreated slowly before the invaders, hoping to lure them deep into the extremely difficult and mountainous country where they would be forced to divide their forces and where their extended lines of communication would offer scope for the guerrilla tactics in which the Ethiopian warriors excelled. The Italians, remembering the hard lesson of Adowa, followed a cautious policy in general, advancing only after thoroughly consolidating their positions. With several notable exceptions, the war during 1935 was consequently devoid of sensational developments. In the early stages of the campaigns, the invaders used aeroplanes effectively in bombing Ethiopian bases and troop concentrations. The Italian land forces, however, were for the most part unable to follow up these initial advantages, due largely to the rugged nature of the country. The Ethiopians quickly adapted themselves to this new type of warfare, and by moving largely at night and by the use of camouflage and decoy encampments they managed to minimize the Italian striking power from the air.

A heavy air bombardment of Adowa, Adigrat, and Makale inaugurated General de Bono's offensive of October 3 against these northern cities. His troops pushed forward with but little opposition, building roads as they advanced, and on October 6 occupied Adowa, thus avenging the defeat of General Baratieri in 1896. Adigrat fell immediately afterwards and the holy city of Aksum on October 11. After this initial push, General de Bono halted to consolidate his position. It was another month before he was ready to move. His second advance carried the Italian flag to Makale, some 70 miles from the Eritrean border, which was occupied November 8. From Adowa and Makale the invaders gradually extended their control to the east and west, advancing southward as far as the great gorge of the Takkaze River.

On November 16 Premier Mussolini replaced General de Bono, apparently because of his slow progress, and named Marshal Badoglio to succeed him. Marshal Badoglio, however, did not change his predecessor's cautious policy. In mid-December it became evident that the Italian lines were already over extended. With about 100,000 troops, they were attempting to hold a front some 300 miles long in a region of towering, rugged ranges cut by deep gorges. The Ethiopians began to penetrate freely through the Italian lines and to attack outposts, camps, and supply trains in the rear. The season of "little rains," coming prematurely, destroyed many of the newly built mountain roads and made the supply problem exceedingly difficult. The growing Ethiopian pressure, reflected in a number of fairly important engagements, forced Marshal Badoglio to shorten his lines and he began a retreat which by the end of the year had surrendered approximately half of the occupied territory. Even Makale and

Adowa were menaced by several powerful Ethiopian armies operating in the vicinity.

One of the most stirring exploits in the northern campaign occurred in mid-November, when a column of Italian colonial troops under Brig. Gen. Oreste Mariotti penetrated the largely unexplored Danakil Depression from Cululli, terminus of the railway from the Eritrean port of Fatima Eri (Marsa Fatma). Continuing across the desert, the column ascended the plateau by way of the Ende gorge, where it was obliged to fight its way through a formidable Ethiopian ambush. It then continued on to Makale, where it joined the main Italian army.

General Graziani's drive from the south against Harar was slow in getting under way. His manoeuvres at first seemed primarily designed to hold as large an Ethiopian force as possible in that vicinity. By the beginning of November, however, he was ready to advance. Using mobile columns of motorized troops accompanied by swift tanks and operating in close conjunction with the air force, he achieved a notable victory in the capture of Gorahai on the lower Fafan River about November 6. This opened the way for an advance towards Harar and Jijiga, where Graziani hoped to cut off the supplies of arms and munitions entering Ethiopia via the caravan route from British Somaliland. From Gorahai he made a swift dash 120 miles up the Fafan valley to Daggah Bur, capturing the important wells at Anale and Sasa Baneh en route. Ethiopian attacks in the rear forced the flying column to retreat all the way to Gorahai, the Italians losing many tanks and trucks in a number of sanguinary engagements. A second Italian flying column advanced as far as Daggah Bur, but it was also forced to withdraw to Gabre Darre, a point a short distance north of Gorahai. As the year ended, the Italian armies there were rushing defensive works against an advancing Ethiopian army under the Turkish general, Wehib Pasha. At Dolo, to the southwest, another Italian force was preparing to resist the advance of another large Ethiopian army under Ras Desta Demtu, son-in-law of Emperor Haile Selassie. Heavy rains, combined with the effective guerrilla tactics of his opponents, had held General Graziani to inconsiderable gains up to the end of 1935.

Meanwhile Italian bombing squadrons had been actively attacking Ethiopian cities far in the interior. A large squadron of Capronis from the northern front bombed Dessye heavily on December 6 and 7. Most of the town, including the Emperor's palace, was destroyed and an American missionary hospital and Red Cross tents were hit. Planes from General Graziani's units repeatedly bombed the Ethiopian stronghold at Daggah Bur and also Filtu and other concentration points of Ras Desta Demtu's forces in the southwest. A Swedish Red Cross unit with the Ethiopian forces near Dolo was destroyed by bombs on December 30 and several of the Swedish doctors were wounded.

Hoare-Laval Peace Effort. While the military campaigns in Ethiopia were thus progressing none too favorably for Italy, the repercussions of the Italian invasion were shaking Europe to its foundations. Great Britain, which during the first months of 1935 had seemed indifferent if not acquiescent to Mussolini's plans, became alarmed after Italy's determination to establish a protectorate over the whole of Ethiopia was revealed. The British home fleet was sent to the Mediter-

ETHIOPIAN WARRIORS LEAVE FOR THE FRONT

Troops parading past the Emperor on the main thoroughfare of Addis Ababa

anean early in September and when Mussolini persisted in his course in Ethiopia despite this threat Europe trembled on the brink of an Anglo-Italian conflict, which was certain to involve all Europe. Feverish preparations for such an eventuality were made in Italy and in all the British possessions in the Mediterranean and the Red Sea (see EGYPT, GIBRALTAR, MALTA, and PALESTINE). The Italians concentrated several divisions of troops on the Libyan frontier in a position menacing Egypt. During the height of the Anglo-Italian crisis Britain sought and received assurance from Greece, Turkey, and Yugoslavia that they would come to her aid if Italy attacked the British fleet as a result of the application of sanctions. Later the other members of the Little Entente—Czechoslovakia and Rumania—made similar commitments (see these countries under *History*).

Meanwhile France, torn by her desire to support the League and still to retain Italy as a strong ally against Germany, attempted to reconcile Britain and Italy. Although forced to accept the League sanctions imposed against Italy and to pledge the use of her ports and fleet to Great Britain in the event of an Italian attack upon the British Mediterranean fleet, Premier Laval qualified his support and used all his influence to find a compromise solution. When Japan seized upon the tension in Europe as the opportunity for a new advance in North China (see CHINA under *History*) and Hitler likewise extended his demands, the dominant group in the British Cabinet acceded to M. Laval's proposals for satisfying Italy at the expense of Ethiopia. The result was the notorious Hoare-Laval peace proposals of Dec. 8, 1935.

As published on December 13 the plan provided for an "exchange of territories" under which Ethiopia was to cede outright 60,000 square miles in Tigre and Ogaden provinces to Italy in return for a corridor of 3000 square miles through Italian Eritrea, including the port of Assab. In addition, Britain and France agreed to support the establishment in Southern Ethiopia of an Italian zone of economic expansion and settlement totaling 160,000 square miles. Ethiopia was offered no compensation, territorial or otherwise, for the latter concession. In this zone, comprising practically the entire southern half of Ethiopia, Italy was to enjoy exclusive economic rights, to be exercised by a "privileged company" controlling all unoccupied lands and exploiting the mineral deposits, forests, and other natural resources. The company would be required to contribute to the economic "equipment" of the country and to spend part of its revenues for the benefit of the natives. The Italian zone was to remain an integral part of Ethiopia but was to be controlled by League administrative bodies in which Italy was to play "a preponderant but not exclusive rôle." Questions regarding the administration of the zone were to be handled by one of the principal League advisers "who might be of Italian nationality," and who would act as assistant to the chief League adviser at Addis Ababa. The League services in Ethiopia would seek "to insure the safety of Italian subjects and the free development of their enterprises."

The strongly unfavorable reaction to these proposals in Britain, France, and throughout most of the world forced their rejection by the League Council. In Britain Sir Samuel Hoare was obliged to resign as Foreign Secretary and the entire Baldwin Cabinet narrowly escaped repudiation (see GREAT BRITAIN under *History*). The Laval

Government narrowly survived attacks by the Left in the French Chamber (see FRANCE under *History*). The League of Nations took the negotiations out of the hands of France and Britain and placed them with a Committee of Thirteen, including the entire membership of the Council except Italy. Thus at the close of the year the League was studying a proposal to add an oil embargo to the list of economic and financial sanctions imposed against Italy by 50 or more League states beginning November 18. The cost of the Ethiopian adventure both in the expenditure of men and money in Africa and in the loss of trade through League sanctions already constituted a heavy burden upon the Italian people. See ITALY under *History*.

Death of Lij Yasu. An important event in Ethiopian history during the year was the death late in November of Lij Yasu, the former Moslem King of Ethiopia, who was deposed in 1916 by a coalition of the great rases (feudal princes) under the leadership of Ras Tafari (who later became the Emperor Haile Selassie) and Zaiditu, the eldest daughter of the Emperor Menelik. Lij Yasu had been held prisoner since his capture in 1921 and it was intimated that his premature death may have been due to reports that the Italians were planning to free him and use him as a tool to establish their sway over the country.

EUCCHARISTIC CONGRESS, SEVENTH NATIONAL. See ROMAN CATHOLIC CHURCH.

EVANGELICAL AND REFORMED

CHURCH, THE. A denomination formed by the merger in Cleveland, Ohio, on June 26, 1934, of the Evangelical Synod of North America and the Reformed Church in the United States. The former was formed at Gravois Settlement, Mo., in 1840 by representatives of the Evangelical Churches of Germany and Switzerland. The latter traced its origin chiefly to the German, Swiss, and French Protestants who settled in America early in the 18th century. Both churches, in doctrine and polity, were akin to the other Reformed bodies.

The highest judicatory of the Evangelical and Reformed Church is the general synod, which will meet biennially. At the Cleveland session the Rev. George W. Richards, D.D., president of the Theological Seminary of the Reformed Church in the United States at Lancaster, Pa., was elected president. The other officers were: Vice-presidents, the Rev. Louis W. Goebel of Chicago, Ill., the Hon. D. J. Snyder of Greensburg, Pa., and J. C. Fischer of Evansville, Ind.; stated clerk, the Rev. J. Rauch Stein, D.D., of Philadelphia, Pa.; associate stated clerk, the Rev. F. A. Meusch of New Albany, Ind.;

treasurer, F. A. Keck of St. Louis, Mo.; associate treasurer, Milton Warner, Philadelphia, Pa.

Previous to the merger the Evangelical Synod of North America reported 1249 congregations, 1191 pastors, and 263,411 members and the Reformed Church in the United States, 1607 congregations, 1334 ministers, and 345,912 communicant members. The local budgets of these congregations will total more than \$8,000,000 for all purposes, their allotment for benevolence exceeding \$1,600,000. The new denomination will continue the work of the Evangelical Synod of North America in India and Honduras and of the Reformed Church in the United States in Japan, China, and Iraq. It also will support more than 300 home mission churches and six special projects among English, German, Czech, and Hungarian immigrants, the Japanese of California, and the Indians of Wisconsin. Of its 11 educational institutions the more important are the Theological Seminary at Lancaster, Pa.; the Eden Theological Seminary at Webster Groves, Mo.; Elmhurst College at Elmhurst, Ill.; Franklin and Marshall College at Lancaster, Pa.; Ursinus College at Collegeville, Pa.; Cedar Crest College at Allentown, Pa.; Hood College at Frederick, Md.; Catawba College at Salisbury, N. C.; and Heidelberg University at Tiffin, Ohio. In addition it will administer 32 benevolent institutions. The principal periodicals are the *Evangelical Herald* and the *Reformed Church Messenger*.

Though the Evangelical and Reformed Church is functioning through its officers and the executive Committee, the Evangelical Synod being an incorporated body has to maintain its corporate entity until such time as the constitution of the new church can be filed with the proper authorities. Rev. F. C. Klick continues to function as president and together with the board of directors attends to all necessary business.

Rapid progress is being made in the merger process. The draft of the constitution is printed and will be submitted to all spring conferences in both groups. The work of the various boards is being coordinated so as to facilitate complete merger after final adoption of the constitution. Joint headquarters are in the Schaff Building, 1505 Race Street, Philadelphia, Pa., and Evangelical Synod Building, 1720 Chouteau Avenue, St. Louis, Mo.

EVANGELICAL CHURCH. A denomination formed by the reunion in 1922 of the Evangelical Association and the United Evangelical Church. (For historical details, see the *NEW INTERNATIONAL ENCYCLOPEDIA*, viii, page 202, and xxii, page 661.) In 1935 it had 24 conferences in the United States and Canada, 1 in Japan, 3 in Germany, and 1 in Switzerland, its membership throughout the world totaling 272,451. In the United States and Canada there were 233,792 members, enrolled in 2046 churches. Of the 2537 churches throughout the world 1892 were served by itinerant preachers and 434 by local preachers. The 2705 Sunday schools had an enrollment of 359,365. Working under the general direction of the board of missions were 1496 women's missionary societies, with a membership of 14,607. The total value of all church property in the United States and Canada was \$33,390,190, while the amount of money raised during the year was \$4,263,887.

The chief schools of the denomination are: North Central College and the Evangelical Theological Seminary at Naperville, Ill.; Western Union College at Le Mars, Iowa; Albright College and the Evangelical School of Theology at Reading, Pa. It also maintains two orphanages and five old people's

homes in the United States, as well as several hospitals. Official periodicals are the *Evangelical-Messenger* and *Der Christliche Botschafter*. A quadrennial general conference was held in Akron, Ohio, Oct. 5, 1934. In their episcopal message to this conference the bishops of the church castigated the American economic system, the movies, and the liquor traffic. All questions of law in the interval between general conference sessions are decided by the board of bishops, which in 1934 consisted of Bishops J. S. Stamm, G. E. Epp, F. W. Praetorius, and C. H. Stauffacher. Headquarters are at the Evangelical Press, 1900 Superior Avenue, Cleveland, O., and in Harrisburg, Pa.

EVOLUTION. See ZOOLOGY.

EWING, SIR (JAMES) ALFRED. A Scottish physicist and engineer, died at Cambridge, England, Jan. 7, 1935. Born at Dundee, Scotland, Mar. 27, 1855, he received his education at the Dundee High School and the University of Edinburgh. For several years he served as assistant to Lord Kelvin and Prof. Fleming Jenkins, and in 1878 was appointed professor of mechanical engineering in the Imperial University of Tokyo. While in Japan he devoted himself assiduously to the study of earthquakes, devising seismographs to record the earth's vibrations during such disturbances. In 1883 he resigned to become a professor of engineering in University College, Dundee, and from 1890 to 1903 he occupied the chair of professor of mechanism and applied mechanics at the University of Cambridge. In the following year he became Rede lecturer at Cambridge, and from 1903 to 1916, was Director of Naval Education to the British Admiralty. He served as a member of the Explosives Commission, 1903-06, and as a member of the Ordnance Research Board, 1906-08. In 1916 he accepted the post of principal and vice chancellor at the University of Edinburgh, serving until 1929. From 1924 to 1928 he was chairman of the Bridge Stress Committee and from 1929 to 1934 of the Committee on the Mechanical Testing of Timber. During the World War, Sir Alfred was in charge of "Room 40" of the Admiralty Office and head of the British government's staff of cipher experts. In 1933 he sought permission to write about "Room 40" in his reminiscences but the permission was refused.

During the course of his career he was the recipient of many honors and received honorary degrees from leading universities. For his researches in magnetism he was given the Royal Medal in 1895, and in 1907 was made a Companion of the Bath and Knight Commander in 1911. In 1929 he received the Albert Medal and the freedom of the City of Edinburgh, and in 1933, the freedom of the city of Dundee. He served as president of the British Association in 1932 and as president of the Royal Society of Edinburgh from 1924 to 1929.

Sir Alfred was the author of a treatise on *Magnetic Induction in Iron and Other Metals* (1891), a work which followed a series of researches in the various phenomena of magnetism published in the *Philosophical Transactions* and the *Proceedings* of the Royal Society, for which he was awarded their Royal Medal. He invented a magnetic curve tracer, a hysteresis tester, and a permeability bridge, which are used by electrical engineers and steel makers in testing the iron employed in the construction of dynamos and transformers. His work on earthquakes resulted in the publication of *Earthquake Measurement* by the University of Tokyo in 1883, and other papers by the Seismological Society of Japan. Also, he wrote: *The Steam*

Engine and Other Heat Engines (1894); *The Strength of Materials* (1899); *The Mechanical Production of Cold* (1908); *Thermodynamics for Engineers* (1920); and *An Engineer's Outlook*, autobiography (1933).

EXPEDITIONS. See ANTHROPOLOGY.

EXPLORATION. The outstanding feat of exploration during 1935 was Lincoln Ellsworth's flight across the Antarctic Continent. This and other explorations in polar regions are described in the article POLAR RESEARCH. For the record of anthropological and archaeological discoveries during the year, see the articles ANTHROPOLOGY and ARCHAEOLOGY. Also see GEOGRAPHICAL SOCIETY, AMERICAN; GEOGRAPHIC SOCIETY, NATIONAL.

Africa. The eastern part of the Libian Desert was again explored by a British motor caravan which left Cairo, Egypt, in January and returned early in April after covering 6500 miles, of which 3000 miles was previously unexplored. The party was headed by W. B. Kennedy Shaw and included Lieut. R. N. Harding Newman, M. H. Mason, R. E. McEuen, and Col. and Mrs. G. A. Strutt. From Dakila Oasis they traversed the Gifl Kebir Plateau, discovering ancient paintings in a cave in the southeast corner of the plateau. The Wadi Hawa was then explored from the frontier of French Equatorial Africa to its end some 250 miles to the east. The green valley was swarming with game, although the expedition found no evidences of water. The expedition lost one of its members—Colonel Strutt—who died in Khartoum from injuries sustained when he fell from a moving car.

The Tafassaset Valley, extending 900 miles through the Sahara Desert, was mapped by a French Army officer. Studies made by Prof. E. P. Stebbing of Edinburgh University along the southern edge of the same desert indicated that it was moving southward at the rate of half a mile annually. The Armand Denis Belgian Congo Expedition under the auspices of the Belgian Government entered the Congo by way of Morocco and filmed wild life in Albert National Park. Part of the expedition under Lelia Roosevelt Denis continued on to Capetown. Mrs. Violet Cressy-Macks, an Englishwoman, made the first trip by motor truck from Addis Ababa, the Ethiopian capital, to Nairobi, in Kenya.

Asia. Dr. Sven Hedin returned to Nanking, China, in April, 1935, from his expedition to Sinkiang Province (Chinese Turkestan). Commissioned by the Nanking Government to survey routes for a motor highway to Sinkiang which would enable Nanking to maintain its hold on that distant territory, Dr. Hedin left Peiping in October, 1933, and traveled west by caravan from Palingmiao, Inner Mongolia, across the southwestern salient of the Gobi Desert to Hami, Urumchi, and Korla in Sinkiang. He then returned by a southern route through Tunghwang, Yumenn, Suchow, Kanchow, Liangchow, and Sian. The expedition had a number of dangerous encounters with rebellious forces in Sinkiang. An equally hazardous 3500-mile trip across western China, northern Tibet, and Sinkiang to Srinagar in Northern India was made by the English author, Peter Fleming, and Mlle. Ella Maillart, a Swiss traveler. Leaving the railroad at Sian, capital of Shensi Province, in the middle of February, 1935, they followed difficult and little-known routes through Lanchow, Sining, Dzun, Teijinar, Cheren, Khotan, and Kashgar to the Indian frontier, arriving at Srinagar September 12.

Arthur S. Vernay and Suydam Cutting, both

trustees of the Museum of Natural History, New York, made extensive collections of rare plant and animal life in the Tibetan Himalayas. Dean Sage, Jr., collected animals, including a giant panda, in western China for the same museum. A party under Brooke Dolan 2d explored little-known territory in eastern Tibet and collected many rare birds and mammals for the Academy of Natural Sciences, Philadelphia. Prof. Nicholas Roerich completed his task of collecting drought-resistant grasses and plants in the Gobi Desert for use by the U.S. Department of Agriculture in re-grassing wind-eroded lands in the arid plains of the American West. A new tribe of pygmies was reported discovered in the mountains of Annam, French Indo-China, by Dr. Pierre Trehout.

The Himalayas attracted fewer mountain-climbing expeditions in 1935, but two ambitious projects were in preparation for 1936. An international group under Prof. G. O. Dyhrenfurth climbed the Queen Mary and Golden Throne peaks, which are among the highest in the world. The English Mount Everest Committee laid plans for another major effort to climb the world's highest summit during 1936. An advance expedition to lay bases and reconnoitre approaches to the mountain was in the field in 1935. The main party, under Hugh Ruttledge, was to start the following spring. Another international group under Dr. Karl Wien planned to renew the assault upon Nanga Parbat. A similar attempt in 1934 cost the lives of 3 Europeans and 6 porters.

North America. Unexplored or little known regions of the Canadian Rockies and the coast ranges of British Columbia and Alaska again attracted a number of expeditions. The riddle of what happens to the Rockies to the north of the sixtieth parallel, where the Laird River cuts across them was solved by a small party under Dr. Charles Camshell, Canadian Deputy-Minister of Mines, which crossed this region in a 4000-mile aeroplane flight from Prince Rupert, B. C., to Edmonton, Alberta. The group reported that the mountains died down in a plateau north of the Laird River.

The National Geographic Society's Yukon Expedition, led by Bradford Washburn, made the first crossing of the St. Elias Range from the Yukon to Alaska and mapped 2000 square miles of territory by aeroplane. Two newly discovered peaks in the southwestern part of Yukon Territory were named King George and Queen Mary, respectively, and a 40-mile glacier was named after Dr. A. Lawrence Lowell, former President of Harvard University. W. A. Wood, Jr., led an expedition sponsored by the American Geographical Society to the same region and succeeded in scaling Mt. Steele. The Rev. B. R. Hubbard, head of the geology department of the University of Santa Clara, continued his investigations of the Alaskan ranges, paying special attention to the depth of the glaciers. An expedition headed by Harry Snyder of Chicago made a 7000-mile trip through northwest Canada, securing animal specimens for the American Museum of Natural History, New York, and the Canadian National Museum in Ottawa. It bagged specimens of a rare black-tailed white sheep and of a little-known race of northern elk.

In the United States, the major work was carried on by the National Park Service, whose expeditions surveyed and explored a 200-mile canyon on the San Juan and Colorado rivers and mapped 3000 square miles of territory. Another party headed by P. J. Shenon and J. C. Reed of the U.S. Geological Survey and sponsored by the

National Geographic Society, descended the difficult canyon of the Salmon River in Idaho on a radio-equipped scow. The river had already been fully explored, but motion pictures of the deep canyon were made and geological studies carried out. Discovery of a cataract in the Chirripo Mountains of Costa Rica having a drop of over 1000 feet was reported by P. Rogers, a nephew of Will Rogers.

Oceania and East Indies. The discovery in 1933 of a previously unknown people in the interior of North Eastern New Guinea by officials of the Australian administration in that mandated territory (see 1934 YEAR BOOK, p. 221) was supplemented in 1935 by the discovery of another allegedly unknown race of about 100,000 people living in a high, inaccessible valley in the adjacent territory of Papua, a dependency of Australia. The discovery was reported by Jack Hides, an assistant resident magistrate who led a patrol on an eight-months' trip through the region to the south of Mount Hagen. He said the tribe lived in a valley walled off by 7000-foot limestone cliffs from the surrounding region. The inhabitants were described as distinct from the previously unknown race discovered in 1933. Short, brown-skinned people of Asiatic type, they had a highly developed agriculture and differed from the Papuans in that they had no villages, each family dwelling upon and tilling its own tract of land. Veteran prospectors in New Guinea discounted Mr. Hides' report, stating they had previously encountered the same tribes which he described. Lord Moyne and a party on board his yacht *Rosaura* visited parts of Netherland India where civilization had not yet penetrated and some of the islands to the east and southeast of New Guinea. Mr. and Mrs. Martin Johnson started on an 18-months' expedition into central Borneo, and G. M. Dyott led a party into the interior of New Guinea.

Several parties were active in the South Pacific. The Templeton Crocker Pacific Expedition returned from a 19,000-mile voyage in that region during which birds and plants were collected for the American Museum of Natural History and anthropological studies made of the inhabitants of Pitcairn and Easter Islands. The Whitney South Sea Expedition also completed six years' work among the islands of the Pacific for the American Museum of Natural History. Archaeological studies on Easter Island were made by Dr. Henri Lavachery of the Belgian Royal Museum of Art and History. Another group under Dr. Dana Coman of Johns Hopkins University studied the marine and plant life of Jarvis, Howland, and Baker Islands in the South Pacific.

South America. A search for Paul Redfern, American flier who disappeared in 1927 while crossing north central South America on a flight from the United States to Rio de Janeiro, was inaugurated in December, 1935, by an aeroplane expedition financed by Edward Sill, a merchant of Georgetown, British Guiana. Rumors from the jungle had indicated that Redfern, injured in the crash of his plane, was living with an inaccessible Indian tribe. With pilots Art J. Williams and Harry Wendt at the controls, flights in search of Redfern were begun from Wanotoba near the source of the Corentyne River on December 8. The river rises in Brazil and flows between British and Dutch Guiana.

Several other exploring expeditions were active in the same region. Two parties under Vice-Adm. C. C. Kayser and Capt. Braz Dias de Aguiar com-

menced the three-year task of mapping the boundary between Surinam (Dutch Guiana) and Brazil. Explorations in British Guiana by Capt. Irving Johnson led to the discovery of a waterfall three times as high as Niagara, he reported. Dr. S. H. Williams of the University of Pittsburgh headed another expedition to British Guiana which spent five months searching for the legendary "lost world," supposed to exist on an inaccessible plateau. The Heye Foundation, Museum of the American Indian, sent Capt. R. S. Murray to British Guiana to study four Indian tribes and an expedition under Capt. Eric Loch to investigate the little known Ssabela Indians on the Upper Amazon. The latter party crossed the Andes in Ecuador and descended the Villano River by canoes to the Ssabelas territory. All the members of the expedition were reported to have suffered from malaria and dysentery. Dr. V. M. Petruccio renewed his studies of the Goajiro Indians of Colombia under the auspices of Columbia University and the Latin-American Institute.

EXPORTS. See AGRICULTURE.

EXTRADITION. See INTERNATIONAL LAW.

EXTRATERRITORIALITY. See INTERNATIONAL LAW.

FALKLAND ISLANDS. A British crown colony, consisting of East Falkland, West Falkland, and adjacent islands. Area, 4618 sq. miles; population (1934), 2437. Stanley, the capital, had 1200 inhabitants in 1934. Sheep farming was the main industry. Wool, tallow, hides and sheepskins, and seal oil were the main exports. In 1934, exports were valued at £142,714; imports, £91,947; revenue, £102,700; expenditure, £54,464. Government was vested in a governor assisted by an executive council of 4 members and a legislative council of 6 members. Governor and Commander-in-Chief in 1935, H. Henniker-Heaton.

Dependencies. The dependencies of the Falkland Islands include South Georgia (1094 sq. m.; population, 650 including 4 females), South Shetlands, South Orkneys, South Sandwich Islands, and Graham Land. Whaling was the main occupation. From the 1575 whales caught during the 1934-35 season, 108,261 barrels of oil and 9,107,300 kilograms of guano were produced. In 1934, imports were valued at £204,854; exports, £455,468; revenue totaled £45,576; expenditure, £14,892.

FAR EASTERN AREA. See SIBERIA.

FARM CREDIT ADMINISTRATION.

See UNITED STATES under Congress; AGRICULTURE.

FARM REAL ESTATE. See AGRICULTURE.

FAROE, fār'ō or fār'ō, ISLANDS. A group of 21 islands between Scotland and Iceland, forming a county of Denmark. The main islands were Børdø, Kalso, Osterø, Sando, Strömø, Suderø, Vaago, and Viderø. Total area, 540 sq. miles; population (1930), 24,200. Capital: Thorshavn (3200 inhabitants), on the island of Strömø.

Government. Administration was under a prefect named by the King of Denmark. The local parliament (Lagting) of 21 members, elected for four years, elects a representative to the Danish Landsting (upper house). The people elect, by vote, a member to the Danish Folketing (lower house).

FASCISM. The wave of fascism which engulfed Germany and Austria in 1933 and spread over Bulgaria and Latvia in 1934 appeared to be definitely on the wane during 1935. It was true that Fascist principles had made definite gains, especially among German-speaking peoples such as those of the Saar, Danzig, Memel, and the

German districts of Czechoslovakia. But these gains had been more than offset by the rebuffs dealt to arbitrary government on every hand.

Perhaps Fascism suffered its greatest blow during 1935 in the land of its origin—Italy. By launching his people upon an expensive and difficult adventure in Ethiopia in cynical disregard of solemn treaties and at the cost of a world-wide economic boycott, Mussolini seriously weakened the moral and material position of fascism among his own as well as other peoples. Students of the situation agreed that the stability of the Fascist régime in Italy depended upon the successful outcome of the fighting in Ethiopia. At the end of 1935, however, the prospects of the Italian invaders looked none too bright. See ETHIOPIA and ITALY under *History*.

Through 1934 and most of 1935 France appeared to be drifting rapidly towards a Fascist dictatorship under Col. François de la Rocque's Croix de Feu. But in 1935 the powerful Radical Socialists joined the Communist-Socialist united front against fascism which had been formed in 1934. The so-called United Front displayed its vigilance by several huge demonstrations in Paris during the year. Its parliamentary strength was revealed by the passage of a bill requiring the disarmament of the Croix de Feu. The strength of the Left, again demonstrated in the French elections, appeared to have definitely eliminated a Fascist dictatorship as an immediate menace. A similar trend was observable in Spain, where the Socialists, Communists, Syndicalists, and Left Republicans formed a strong united front organization in preparation for the forthcoming 1936 elections. In Great Britain, the Irish Free State, and the other democratic countries of northwestern Europe, the various Fascist movements which had formerly aroused widespread alarm had declined to relative insignificance. Exceptions to this rule were to be observed in Belgium, where extremists in both the rival Flemish and Walloon factions had adopted Fascist programmes based upon the idea of racial dictatorship. The Flemish Fascists, as well as those in the Netherlands and the Scandinavian countries, were charged with receiving subsidies and orders from the Hitler régime in Germany.

Other setbacks to fascism during the year were the overthrow of the dictatorship in Bulgaria by King Boris and the death of Marshal Pilsudski, for many years dictator of Poland. In Greece Marshal George Kondylis overthrew the republic on October 10 and established himself temporarily as regent and virtual dictator. His aspirations to play the rôle of Mussolini in Greece were frustrated, however, by the firm stand in favor of constitutional government taken by King George II following his restoration on November 25. Yugoslavia, whose King-dictator had been assassinated Oct. 9, 1934, made marked progress towards the development of popular and constitutional rule during 1935.

The *New York Times*, editorially surveying the course of the struggle between arbitrary and democratic government during 1935, reported that the United States had experienced "a marked revival of what we had always regarded as democratic aspiration and practice." The demand for greater vitality and reality in State governments had been encouraged by decisions of the Supreme Court. On the other hand a number of liberal agencies and organizations, such as the Civil Liberties Union and the Methodist Federation for

Social Service, as well as radical spokesmen such as Norman Thomas, gave repeated warnings that a strong trend toward fascism was evident in the United States. Senator Huey Long of Louisiana and Father Charles Edward Coughlin, the Detroit radio priest, were widely attacked as the leading exponents of American fascism. The death of Senator Long (q.v.) from an assassin's bullet cut short his spectacular career. The spread of teachers' oath bills and other anti-liberal measures was regarded as further evidence of Fascist tendencies.

In Brazil, Argentina, and Chile, where the struggle for popular government and for the abolition of semi-feudal economic conditions had the ruling land-owning aristocracies on the defensive, there was a marked growth of frankly Fascist groups, who threatened to overthrow the existing governments as well as to abolish liberalism and radicalism as political forces. The death of President Gomez of Venezuela on December 17 ended his long and exceedingly arbitrary dictatorship and was the signal for demonstrations in favor of popular rights and popular government. Mexico's Fascist Gold Shirts clashed with Leftists before the National Palace on November 20, the broil costing five lives and wounds to 34.

In the Far East the struggle between the advocates of arbitrary and constitutional government proceeded with great intensity, particularly in Japan, where the issue of expansion in China and war with the Soviet Union hung on the issue. In general during 1935 the civilian forces, with the aid of the more moderate element in the army and the Emperor, held the radical Japanese militarists in check. But the latter were by no means reconciled to this. In China Gen. Chiang Kai-shek strengthened his dictatorship during 1935 by securing his election as chairman of the Executive Yuan. His opponents were crushed not only by the use of the police and the army but also through his Fascist Green Shirt organization.

See COMMUNISM; SOCIALISM; ESTONIA and the articles on the various countries mentioned above, under *History*.

FEDERAL AVIATION COMMISSION.

See AERONAUTICS.

FEDERAL CAPITAL TERRITORY, AUSTRALIA. A territory of 940 sq. miles within the State of New South Wales, containing Canberra, the capital of Australia. The estimated population (Mar. 31, 1935) was 9407 compared with 8947 (1933 census). Canberra had 7500 inhabitants on Jan. 1, 1935.

Government. For 1933-34, revenue was £412,695; expenditure, £955,434. Control of the Territory was exercised by the Australian Minister of the Interior but certain services were taken care of by the Department of Health and the Attorney General's Department. See AUSTRALIA.

FEDERAL COORDINATOR OF TRANSPORTATION, REPORTS OF. See RAILWAYS.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1935 it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention; Free Baptists; Seventh-Day Baptists; General Council of the Congregational and Christian Churches; Disciples of Christ; Evangelical Church; Evangelical

and Reformed Church; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Protestant Episcopal Church; Reformed Church in America; Reformed Episcopal Church; United Brethren in Christ; United Presbyterian Church of North America; United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council coöperates in certain specified areas of work. Since 1932 the United Church of Canada has been affiliated with the Council.

The total number of communicant members included in the Council's constituency, according to the *Yearbook of the Churches*, 1935, was 24,213,423. Coöperating with the Council were such agencies as the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Foreign Missions Conference of North America, and the International Council of Religious Education.

Of the Council's eight departments the following made a significant contribution during 1934. The department of social service accepted the responsibility, at the invitation of the U. S. Bureau of Prisons, of nominating and training chaplains for Federal penitentiaries; the department of evangelism launched a "National Preaching Mission"; and the department of international justice and goodwill concentrated on creating public support for American neutrality in the event of war. The radio department sponsored 12 religious programmes on the air each week; the department of research and education made a special study of the relation of church and state; and the department on race relations surveyed conditions confronting share-tenants and share-croppers in Alabama and Arkansas. The department of relations with churches abroad shared in the Universal Christian Council for Life and Work, held in Chamby, Switzerland in August, 1935. The *Federal Council Bulletin*, a monthly, continued to be issued as the official organ.

At the Council's biennial session, held in Dayton, Ohio, Dec. 4-7, 1934, the Rev. Ivan Lee Holt, pastor of St. John's Methodist Episcopal Church, South, St. Louis, Mo., was elected president. The Rev. George W. Richards, president of the Theological Seminary of the Reformed Church in the United States and of the newly formed Evangelical and Reformed Church, was elected vice-president. The general secretary is the Rev. Samuel McCrea Cavert. National offices are at 105 East Twenty-second Street, New York City. Regional offices are maintained in the Woodward Building, Washington, and at 203 North Wabash Avenue, Chicago.

FEDERAL EMERGENCY RELIEF ADMINISTRATION (FERA). See UNIVERSITIES AND COLLEGES; WELFARE WORK; UNITED STATES under *Administration*.

FEDERAL MUSIC PROJECT. See MUSIC.

FEDERAL TRADE COMMISSION. See UNITED STATES under *Administration*.

FEDERATED MALAY STATES. The four states, shown in the accompanying table, of the Malay Peninsula.

State	Sq. mi.	Pop. (1934)	Capital
Negri Sembilan	2,560	223,437	Seremban
Pahang	13,970	178,839	Pekan
Perak *	7,923	744,436	Taiping *
Selangor	3,160	503,012	Kuala Lumpur
Fed. Malay States ..	27,613	1,649,724	Kuala Lumpur

* Includes the Dindings (183 sq. mi.; 18,205 people) transferred to Perak by the Straits Settlements on Feb. 16, 1935. * The British Resident of Perak announced early in 1935 that the transfer of the capital to Ipoh had been approved, but the change must await the first suitable opportunity.

Chief towns: Kuala Lumpur (114,219 people), Ipoh (53,146), Taiping (30,132), Kampar (15,169), Seremban (21,563), Klang (21,621), Teluk Anson (14,768).

Production and Trade. The main products during 1934 (export figures in parentheses) were para rubber (256,516 tons), para latex (2,814,870 gall.), tin and tin ore (36,385 tons), copra (73,289 tons), firewood and timber (28,965 tons), canned pineapples (9475 tons), tapioca (2335 tons), palm oil (10,576 tons), palm kernels (2030 tons), gold (26,156 oz.). In 1934, imports were valued at \$84,731,059; exports, \$198,306,646 (\$\$ averaged \$0.5901 for 1934).

Government. For 1934, revenue totaled \$58,926,323; expenditure, \$47,211,228; public debt, \$96,185,714. The states were under the protection of Great Britain and were governed by a Federal Council in matters common to the four states. State councils legislate in individual state matters. The Federal Council consisted of the Governor of the Straits Settlements (who was ex officio High Commissioner) as President, 14 government officials, and 12 unofficial members nominated by the High Commissioner. There was a native ruler, assisted by a British resident, in each of the four states. High Commissioner in 1935, Sir T. S. W. Thomas. See BRITISH MALAYA.

FENCING. Pointing towards the Olympic games, fencing made great gains in dexterity and in number of competitors in 1935. The most significant development of the year was the return to the strips of Joseph C. Levis after a year's absence to reclaim the national foils championship which he had lost by default in 1934. The lone newcomer to the ranks of national champions was Lt. Thomas J. Sands, who triumphed with the épée. Sands and Norman C. Armitage, saber champion, represented the Fencers Club which annexed foils team, épée team and three-weapon team honors. The sabre team title went to the Salle D'Armes Vince and Dr. John R. Huffman captured the three-weapon crown.

In the college ranks New York University duellists won a major share of the laurels, taking team and individual foils and team three-weapon honors in the championships held in April. Hugo Costello, sophomore and son of the N.Y.U. coach, signaled his début in intercollegiate competition by winning the foils championship. Columbia University scored heavily with the sabre, taking the team crown and the individual laurels with Forrest Lombaer. Harvard turned back Navy to win the épée team and Kirkland B. Alexander of Princeton won individual honors with the épée.

Miss Helene Mayer, the girl who won the Olympic championship in 1932 for Germany, represented the Los Angeles A.C. and won the women's

national crown. Women's team laurels went to the Salle D'Armes Vince and Miss Frances Siegel topped a good field to win the junior title, the other women's individual championship.

FERTILIZERS. The total consumption of fertilizers in the United States during 1935 while still considerably below normal, showed an increase of approximately 10 per cent over the preceding year, thus completing two successive years of gradual increase. During the first six months of 1935 exports of fertilizers were 8 per cent under those of the corresponding period of 1934 in tonnage and 13 per cent in value, the most significant decreases being in nitrogenous chemicals. Imports in the January-June period exceeded those of the preceding year 11 per cent in tonnage and 8 per cent in value, the increase being due to larger imports of potash salts.

According to the National Fertilizer Association the fertilizer industry was regaining its lost tonnage in direct relation to the return of farm purchasing power. Fertilizer tax tag sales were larger in the 12 Southern States during June than during any similar period since 1931, and were 12 per cent larger than during the same month of the previous year. The National Fertilizer Association estimated that the capacity of the fertilizer industry in the United States to produce mixed fertilizers, superphosphate, and nitrogen far exceeded the present consumptive demand and that the infant potash industry was supplying about one-half of the national requirements.

Major members of the fertilizer industry devoted effort to the formulation of a plan of operation under a programme of voluntary self government following the period of operation under the Code of Fair Competition for the Fertilizer Industry which was invalidated along with all other NRA Codes by Supreme Court decision. Tentative plans include the organization of district associations to bring about compliance with or observance of fair trade practices.

The National Fertilizer Association and the U.S. Bureau of Chemistry and Soils were coöperating in a comprehensive study of the number of grades and the kinds and amounts of fertilizers consumed in each State during the previous fiscal year. Reports were already available from the fertilizer industry covering more than 78 per cent of the total tonnage of mixed fertilizers and fertilizer materials sold in the United States during the year, of which 74 per cent consisted of mixed fertilizers and 26 per cent of fertilizer materials. At least 1291 different grades were sold during the year.

Foreign developments of major importance continued to affect the American fertilizer industry. According to the U.S. Department of Commerce the trade pact between Spanish potash producers and producers in Germany, France, and Poland for regulating the world potash trade was confirmed, bringing the entire Spanish potash industry into alliance with European cartels. The purpose of the agreement is to regulate exports of potash by cartel members in order to reduce distribution costs and secure the best possible returns for all concerned. Its immediate effect was to terminate the severe price war which has been in effect for two years and which was responsible for a 40 to 50 per cent reduction in world potash prices. The Spanish production will be distributed by the export organization of the Franco-German syndicate. The cartel now includes all important European

producers of potash except the U.S.S.R. and Palestine.

The position of the Chilean nitrate industry was very much improved over that of previous years. Chilean nitrate interests and the European cartel of synthetic nitrogen producers signed a three-year nitrogen marketing agreement which is retroactive to July 1, 1935. In addition to Chile, signatories to the pact included representatives of Belgium, Czechoslovakia, Germany, Great Britain, Holland, Italy, Norway, Poland, and Switzerland.

According to the U.S. Department of Commerce the French government requested the nitrogen industry to reduce the sale price of nitrogenous fertilizers 10 per cent which would include a previous reduction of 4 per cent and make necessary an additional reduction of 6 per cent. A decrease of 5 per cent was brought about in the price of potash fertilizers and a series of reductions in the price of superphosphates resulted in a total reduction of from 9 to 12 per cent according to localities. The price of basic phosphatic slag was reduced 10 per cent as of August 16, 1935.

Chile and Peru took steps to conserve their guano supplies. The semi-official monopoly controlling the guano resources of Peru decided to export no more guano for several years in order to protect the interests of local agriculturists. In order to insure continuation of revenue to the government, formerly derived from exports, domestic prices were increased. In the face of a threatened shortage of guano, the Chilean government took steps to regulate the industry and protect guano-producing birds, and also canceled all concessions for private exploitation of the deposits. The industry was turned over to a state monopoly.

It was disclosed during recent discussions between representatives of the European Nitrogen Syndicate that Japanese production of ammonium sulphate for the fiscal year ending June 30, 1935, was short of consumption requirements by 100,000 to 150,000 metric tons. In return for the guaranteed delivery of needed imports at about \$25 per metric ton, Japanese manufacturers must refrain from exporting this material to the exclusive markets of the European syndicate and must limit exports during the next year to 50,000 metric tons. The *Oriental Economist* estimated that production of ammonium sulphate in Japan during 1935 was 900,000 metric tons and imports were 100,000 metric tons with no exports.

The world picture of the fertilizer industry showed general improvement in most quarters. According to the National Fertilizer Association the recovery programme in the United States directly benefited the industry. Early estimates indicated that American capacity to produce potash was much in excess of that of 1934 and that deposits already located are sufficient to provide all the potash likely to be needed for more than 200 years. Capacity was available to produce far more chemical nitrogen than the total combined consumption of industry and agriculture and imports were due almost entirely to preference of farmers for certain forms, particularly Chilean sodium nitrate. An average increase in production of ammonium sulphate in the United States occurred from January to August, inclusive, as compared with production during the same period of 1934, with the July and August increases being the largest.

American producers and importers of potash salts announced the organization of the American Potash Institute Incorporated for research and de-

velopment in the efficient and profitable use of potash in crop production. The U.S.S.R. potash output was increasing and was estimated to reach the 300,000 ton mark during 1935, thereby placing the U.S.S.R. in third place as a world potash producer. According to the U.S. Department of Commerce, current world production of potash fertilizer indicated that industry was rapidly recovering, with Germany continuing to be the outstanding world producer. French potash production also showed an upward trend accompanied by an increased volume of high grade salts.

Significant trends in the direction of greater efficiency in fertilizer use continued, including especially better knowledge of proper application; substitution of neutral and basic for acid-forming fertilizers; an increasing plant food content in fertilizers; a greater appreciation of the value of minor plant nutrients, a better understanding of the relative performance of different forms of nitrogen and a reduction in number of grades of fertilizers sold. Progress was also made in the development of essential relationships between the use of fertilizers and human health with special reference to the use of such elements as iodine, iron, copper, calcium, phosphorus, sodium, potassium, magnesium, sulphur, and manganese.

Increasing attention was being given by fertilizer manufacturers to the chemical changes in fertilizer mixtures containing dolomitic limestone and phosphate rock, the indications being that dolomite causes reversion of a portion of the available phosphoric acid in mixtures manufactured and stored under factory conditions, whereas the use of ground rock phosphate does not cause reversion but results in an appreciable gain in available phosphoric acid. A subcommittee on acid-neutral fertilizers of the American Society of Agronomy was appointed which outlined a research programme to determine the effect of different neutralizing agents on fertilizers and soil acidity. Studies by the U.S. Bureau of Chemistry and Soils on the effect of increasing the plant food content on the cost of plant food delivered to the farm showed that in New York and Pennsylvania, for example, a farmer could reduce his plant food cost 17 per cent merely by buying a higher grade fertilizer of the same plant food ratio, and in North Carolina a saving could be realized of from 8 to 20 per cent.

The development of new and cheaper methods of fertilizer manufacture continued and as a result of these improvements the mean wholesale price of all fertilizer materials, excluding organic ammoniates, is now only about half of what it was in 1900 according to the U.S. Bureau of Chemistry and Soils. The action of the Alabama Board of Agriculture in reducing the number of grades of fertilizer to be sold in the State to 13 was typical of this tendency throughout this country.

In Canada, provincial fertilizer councils, comprising manufacturers, farmers, and agricultural chemists, were organized to reduce the number of fertilizer analyses being produced. While previously there had been some 350 fertilizers registered under the Canadian fertilizer act the action of their councils resulted in a great reduction in the number of fertilizer analyses on the market without in any way lowering the efficiency of the mixtures for any desired purpose.

According to the *Chemical Trade Journal*, the value of magnesium in fertilizer mixtures attracted considerable attention in continental Europe. In France a fertilizer consisting essentially of mag-

nesium ammonium nitrate was introduced and acquired considerable popularity in wheat growing areas. In Germany the potash syndicate introduced a 40 per cent potash fertilizer salt with a guaranteed content of 5 per cent of potassium magnesium sulphate for use on light soils. Studies in Germany confirmed the essential character of magnesium to some crops and showed that magnesium sulphate is the most suitable form of this element. Apparently the essential properties of magnesium are related to chlorophyll formation. Similar results were obtained at the Connecticut and Maine Experiment Stations, the latter reporting that the use of dolomitic limestone is the best method of preventing magnesium deficiency in potatoes.

The research programme of the U.S. Bureau of Chemistry and Soils again was concentrated largely on the conversion of the country's natural resources of nitrogen, potassium, and phosphorus into improved fertilizer materials, the preparation of fertilizer mixtures which promote crop growth without increasing soil acidity, the production and study of the properties of new fertilizer compounds with special reference to their use in mixed fertilizers, and the need for minor plant food elements. Pioneer work was continued on the use of modern physical and physico-chemical research methods in the attack on numerous fertilizer problems of economic importance, the solution of which depends upon a knowledge of the physical constants and ultimate structure of the elementary substances and compounds involved.

Studies were continued of the factors which influence and determine the activities of catalysts in the various steps of processes for converting atmospheric nitrogen into nitrogenous fertilizer materials. This made possible the general employment in this country of the direct synthetic ammonia process with resultant low fixed nitrogen prices and self sufficiency for peace time industries and national defense. Although these developments together with increased consumption of organic ammoniates in animal feeds caused considerable displacement of the use of these ammoniates for fertilizers, demand for them still remained strong, despite their relatively high price, because of their resistance to leaching, action as conditioners in mixed fertilizers, slight tendency to increase soil acidity and slow rate of availability.

Efforts to produce cheap fertilizer materials that possess these desirable properties from organic materials of little or no value showed that those obtained by the ammoniation of peat gave most promise of serving as substitutes for the expensive organic ammoniates. Pot and nitrification tests indicated that under certain conditions of preparation and use the ammoniated peat is a suitable fertilizer material. Among several double salts of urea a combination of urea with magnesium sulphate was found to be of promising fertilizing utility. In that general connection urea was placed in production in commercial quantities by a large commercial plant in West Virginia.

Studies of the natural fixation of nitrogen in the soil by soil organisms continued at the State agricultural experiment stations and the U.S. Bureau of Chemistry and Soils. The bureau showed that *Azotobacter* is able to produce ammonia from a large number of nitrogenous compounds including proteins, amino acids, nucleic acids, and simple and substituted amides, and also from its own cell nitrogen, and that the ammonification takes place under aerobic and anaerobic conditions. Studies were started on cell oxidation as it occurs in

legume nodule bacteria. Preparations of the accessory substance essential to the respiration and growth of certain species of nodule organisms, considerably more concentrated than those obtained previously from sugar and molasses, were obtained by taking advantage of the fact that it is synthesized by Azotobacter. Studies dealing with leguminous plants emphasized the importance of carbohydrate supply in nodulation and nitrogen fixation.

Studies by the U.S. Bureau of Chemistry and Soils of processes for the production of potassium metaphosphate from potassium chloride and phosphoric acid, products of the blast furnace extraction process, showed that a two-stage procedure, the first conducted at 200° C with steam and the second at 540° C without steam, gives a product which when ammoniated can be used directly as a concentrated fertilizer. Recent developments in the cement industry made possible the large scale production of by-product potash as fume from cement kilns. This product may be variously treated to yield higher grade fertilizer materials. Continuing the study of the extraction of potash from silicates by hydrochloric acid, the U.S. Bureau of Chemistry and Soils designed an improved procedure wherein the dissolved salts obtained are precipitated with gaseous hydrochloric acid and are then selectively hydrolyzed for the separation of the potash and alumina as high grade products. Work on the solubility of alunite in various commercial solvents also was completed, indicating the possibility of using either potassium or sodium hydroxide to extract both the potash and alumina from previously roasted alunite.

The U.S. Bureau of Mines announced that mechanical methods of concentration were applied successfully to potash ores. Experiments with materials from the Carlsbad region of New Mexico containing 40 per cent potassium chloride and 60 per cent sodium chloride indicated the possibility of recovering over 96 per cent of the potassium chloride in the original material in a concentrate containing 95 per cent potassium chloride and only 5 per cent extraneous material. High grade concentrates were made with any one of three methods, involving tabling and flotation, tabling an agglomerated feed supplemented by flotation, and all flotation. Best results were secured if the ore was treated with crude oil prior to tabling. The drastic reduction in the prices of fertilizer potash salts occurring during the year altered the economic prospects of chemical processes for the extraction of potash from the potassium aluminum silicates.

Continuation by the U.S. Bureau of Chemistry and Soils of work on the process of preparing phosphate fertilizer by calcining silica bearing phosphate rock at 1400° C in the presence of water vapor showed that Tennessee brown rock phosphate is somewhat better adapted to the manufacture of calcined phosphate than are the other types of domestic phosphate rock, and that phosphate rock that has been concentrated by flotation methods can be used directly in the manufacture of calcined phosphate. Vegetative pot tests conducted in cooperation with the U.S. Bureau of Plant Industry and the Alabama, Arkansas, and West Virginia Agricultural Experiment Stations showed that properly prepared calcined phosphate is as good a source of phosphorus for plant growth as is either superphosphate or di-calcium phosphate.

These findings attracted wide interest in the fertilizer and phosphate rock industries. The

bureau also found that when by-product hydrochloric acid is used for the treatment of phosphate rock a hitherto unknown salt, calcium phosphate chloride, can be formed which is a suitable fertilizer material and may also be used for the preparation of di-calcium phosphate and calcium pyrophosphate. Additional information accumulated which is of primary importance in the preparation of superphosphates and complete fertilizer mixtures having good mechanical condition and satisfactory storing and drilling qualities.

A prominent commercial concern introduced a new nitrogen solution to the fertilizer industry for the ammoniation of superphosphate and triple superphosphate, the normal composition of which is ammonium nitrate, 60 per cent, ammonia 20 per cent, and water 20 per cent. An investigation was started to determine if superphosphate prepared with waste sulphuric acid from the refining of petroleum is harmful to plants and soil. A granular superphosphate containing 32 per cent available phosphoric acid for direct application purposes was put on the market which was found to be an improved form of this material by the Indiana Agricultural Experiment Station. A comprehensive report of the recently concluded experimental work of the U.S. Bureau of Chemistry and Soils on blast furnace smelting methods as applied to phosphate and potash rocks was in the course of preparation.

The U.S. Bureau of Chemistry and Soils and the State agricultural experiment stations continued to enlarge the knowledge of mixed fertilizer technology. A study of the effects of particle size on the drillability and efficiency of fertilizers was completed indicating that particles of superphosphate finer than 80 mesh are more efficient for growing cotton than are coarser particles, whereas large particles of soluble nitrogenous materials are better than fine powders. Nitrogen, potash, and total soluble salts were removed by natural agencies from the placement area in the soil in greater proportion as the size of the particles decreased.

Additional evidence was secured of the importance of reinforcing concentrated fertilizers with some of the less common elements such as manganese, zinc, nickel, copper, and iron for the efficient production of some crops. Zinc sulphate was found to control pecan rosette in Texas and mottle leaf of citrus in Florida and California, and Arizona citrus groves were aided in health and fruitfulness by the addition of a soluble iron salt to the plant or the soil.

Bibliography. Sources of information regarding progress in the production and use of fertilizers are numerous. Current progress is recorded in the *Fertilizer Review* published by the National Fertilizer Association at Washington, D. C., and in the *American Fertilizer* published in Philadelphia, Pa. Statistics of the fertilizer trade and industry will be found in reports of the U.S. Department of Commerce. Other recent publications of interest were: *The Use of Limestone in Mixed Fertilizers*, by J. W. Tidmore and C. F. Simmons (Alabama Station Circ. 67, Auburn, Alabama, 1934); *Fertilizer Usage in Ohio from 1920 to 1934*, by R. M. Salter (Ohio Station Bimonthly Bull. 173, Wooster, Ohio, 1935); *The Use of Fertilizers: A Guide to the Manuring of Crops in Great Britain*, by A. S. Barker (Oxford University Press, London, 1935); *Report on Phosphate Investigations During 1934* (Montana Station Bull. 296, Bozeman, Mont., 1935); *The Value of Gypsum as a Supplement to a Concentrated Fertilizer*, by

L. G. Willis (North Carolina Station Bull. 299, Raleigh, N. C. 1934); *A Review of the Patents and Literature on the Manufacture of Potassium Nitrate with Notes on Its Occurrence and Uses*, by C. W. Whittaker and F. O. Lundstrom (U.S. Dept. of Agri. Misc. Pub. 192, Washington, D. C., 1934); *Suitable Fertilizer Mixtures for Different Crops, Including the Functions of Chief Plant Nutrients*, by H. B. Mann and W. H. Rankin (North Carolina Station Agronomy Information Circ. 89, Raleigh, N. C., 1934); *Interpreting Fertilizer Analyses with Reference to the Sources of Nitrogen* (A. W. Blair, New Jersey Stations Circ. 331, New Brunswick, N. J., 1934); *Relation of Fertilizers to the Control of Cotton Root Rot in Texas* (U.S. Dept. of Agri. Tech. Bull. 426, Washington, D. C., 1935); *Experiments with Nitrogen Fertilizers on Cotton Soils* (U.S. Dept. of Agri. Tech. Bull. 452, Washington, D. C., 1935); *Fertilizer Studies with Sugar Beets in the Arkansas Valley Area, Colo., 1921-28* (U.S. Dept. of Agri. Circ. 319, Washington, D. C., 1935); *Concentration of Potash Ores of Carlsbad, New Mexico by Ore Dressing Methods*, by W. H. Coghill et al (Bureau of Mines Report of Investigation 3271, Washington, D. C., 1935).

FESTIVALS. See MUSIC.

FIJI, fē'jē, ISLANDS. A British colony in the South Pacific Ocean, comprising some 250 islands (80 inhabited) and the dependent islands of Rotuma, Viti Levu (4053 sq. m.) and Vanua Levu (2128 sq. m.) were the largest islands. Total area, 7083 sq. miles; total population (Jan. 1, 1935), 197,449. During 1934 there were 7196 births, 3054 deaths, and 1926 marriages. Chief towns: Suva (capital), on Viti Levu, 12,982 inhabitants in 1931; Levuka, on the island of Ovalau.

Production and Trade. Sugar, copra, molasses, trocas shell, butter, pineapples, and native food-stuffs were the main products. Sugar production for 1935 was estimated at 124,000 tons. In 1934, exclusive of transshipments, imports were valued at £995,204; exports, £1,456,455 of which sugar (103,863 tons) accounted for £1,069,049; copra (23,520 tons), £127,941; bananas (324,494 bunches), £67,845; gold (1033 oz.), £7590.

Government. For 1934, revenue amounted to £782,914; expenditure, £722,963; the total loan debt on Jan. 1, 1935, amounted to £1,273,901 (sterling) against which the sinking funds totaled £96,142 (Fiji). Government was vested in a governor aided by an executive council of 7 members, and a legislative council of 25 members. The Governor was also High Commissioner for the Western Pacific. Governor in 1935, Sir A. G. M. Fletcher.

FINANCE. See FINANCIAL REVIEW; PUBLIC FINANCE; UNITED STATES under *Administration*; and sections under *Finance* in countries.

FINANCIAL REVIEW. The year 1935 was by most financial observers reckoned a year of decided "recovery." Not only did the average level of securities of almost all classes advance markedly during the year, but the last three months of that period witnessed a revival of many of the favorite methods of speculation in issues which had been thought likely to suffer neglect for an indefinite period. The irregularity and "spotty" character of market advances which had been characteristic of the earlier years 1933-34 when sporadic increases had been invariably succeeded by corresponding declines, came to an end by the beginning of spring 1935, and, simultaneously with the decision of the Federal Supreme Court holding the National Recovery Administration Act un-

constitutional, was followed by a sustained upward movement of values which carried through until practically the end of the twelvemonth. Temporary declines and recessions were, of course, noted from time to time but they were only sporadic.

The general forward movement which occupied the months from March to December was consequently hailed as signaling a general return of "prosperity." While the volume of business in the stock and bond markets was not up to the heights of great excess in the 'twenties, the turnover in both branches was distinctly larger and the movement in the prices of shares brought the average of representative industrial issues up to above 140 during the last few days of the year; while bonds were a little below 100 (Dow, Jones averages). Taking the year as a whole, the average of stocks was 113.0 as against 106.7 for the year 1934. After long waiting the volume of business was now at length sufficient to provide a living income to the principal brokerage and bond houses, and in spite of all that had been said in criticism of the Federal Securities Act, the administration of the law was such as apparently to avoid any distinct or traceable restraining influence upon the total turnover, except for the increase in rates of charges which were entailed by it in the cost of doing business.

The reasons for the improvement were, of course, various, depending a good deal upon the bias and point of view of the person assigning them. Net earnings, although still suffering from tremendous burdens of taxation and threatened with more to come, were unquestionably better, while disbursements for dividends were unexpectedly large, due to the fact that the tax situation induced many concerns which would otherwise have carried portions of their earnings to surplus, to divide them among their stockholders in order to lighten the load of public charges resting upon the latter. Many persons were inclined to attribute the revival of stock market activity to the apparently hostile attitude which had been adopted by the Supreme Court of the United States with regard to the characteristic legislation of the so-called "New Deal." Others found it directly attributable to the movement of capital to the United States, now that Europe had become partially reassured with respect to the suspicion of intention to apply a policy of further devaluation. Still others were inclined to ascribe it to a natural revival of business taking place as a result of long deferred demand which could not indefinitely remain unsatisfied.

Whatever the explanation of it may have been, there was no doubt about the increase in the degree of activity. The turnover on the New York Stock Exchange—which at the beginning of the year was moderate (being usually less than one million shares a day)—had reached at the end of the season the extraordinary level of over two to three million shares daily, while bond trading had been similarly increased. In spite of the fact that Treasury operations were admittedly excessive and unsound the manipulation of the market on behalf of the government, carried on by various institutions to which the work had been assigned, resulted in holding up the values of government bonds and maintaining an abnormally high level of prices for the securities.

The transactions of the New York Stock Exchange for the year 1935 amounted to 381,666,000 shares or transfers of stock as against 323,871,000

for the preceding year and about 665,000,000 for 1933; while total bond sales were \$3,347,855,000 as against \$3,729,000,000 the year before and \$3,366,000,000 in 1933. There were many trading days of large activity, although none with the phenomenally high turnover which had been witnessed in some former years. During 1935 there were relatively few days with more than four million shares turnover each. This business moreover was quite thoroughly and evenly distributed and as a result the closing of branch houses by stock exchange firms was practically brought to a stop, while various new branches were opened during the year. The total number of main offices open at the close of the year was 639 with 1096 branches as against 1093 branches 12 months earlier. Despite the fact that foreigners had continued to remain out of the market as had been the case ever since 1932, the rising prices and renewed activity with prospects of corresponding gains drew many of them back into the market from and after September; so that by the close of the year the markets of Great Britain and continental Europe were again doing a comparatively satisfactory business in New York.

Trend of Security Prices. The trend of stock prices on the Exchange which had been described only in large terms may be compared with that of former years in the following table.

RANGE OF STOCK PRICES, BY YEARS

Year	High	Low	Range	Year	High	Low	Range
1924	95 0	72.1	22 9	1930	182.7	127 9	54 8
1925 ..	118 2	90 4	27 8	1931	143 8	89 2	54 6
1926 ..	122 2	103 5	18 7	1932	95 4	73.6	21 8
1927	147 7	118 2	29.5	1933	107.7	79 1	28 0
1928 ..	181 1	141.1	40.0	1934	106 7	93 3	13 4
1929 ..	208 9	154 6	54 3	1935	113 0	93 2	19 8

The situation as to bond prices was unusual. It has been customary among superficial market analysts to lay down the "law" that when stock prices rose, bonds declined and vice versa. During the years of depression bond prices had gradually recovered from the first shock of disaster and had gradually advanced to a very high level by the close of 1934. This high level was further raised during 1935 and, as stock prices took on some aspects of boom, the quotations of bonds failed to register any corresponding tendency to fall off. The conventional methods of investment were largely set at naught and those who had gone into bonds when they were at low levels, were able to reap corresponding profits or to remain in bonds with gratifyingly stable prices, according as they chose. The end of the year found them practically at high point. Foreign bonds suffered in particular issues on account of war conditions abroad, a fact which was conspicuously true of Italian issues. Others were subject to fairly serious fluctuations but also, invariably, as a result of home conditions and without any reference to the general situation of the money market.

Banking Conditions. During the year conditions were such as to provide abundant supplies of cheap money had they been called for, but the banks continued to find themselves disappointingly without applications for funds from brokers. The total of brokers' loans for December was only \$954,000,000 while the aggregate of other loans protected by collateral security at reporting member banks was only about \$2,111,000,000 at the end of December, as against \$2,260,000,000 a year earlier.

The Reconstruction Finance Corporation which in 1933-34 had widely recapitalized the banks, taking out preferred stock in some 6000 in all and

embarking close to one and a quarter billion dollars of the government's money in bank stock, continued to purchase stock and to make loans. Its president, Mr. Jesse Jones, about the middle of December took occasion to assure bankers that they need be in no hurry to repay the preferred stock or to settle their advances. During the year 1935 it also made a substantial amount of advances to business and public utility enterprises, and although the constant announcement was made as in former years that these loans were being repaid and that it probably would soon be able to retire from business with a profit, there was little in the figures to warrant any such expectation. The apparent abundance of cheap and easy credit which had been characteristic of 1934 was more than ever evident as 1935 drew to a close, and this was conspicuously true in land mortgage financing, although it remained a fact that savings banks exercised great caution with regard to the character of the security which they accepted in order that they might not run the risk of becoming "tied up" as the result of the various moratoria and restrictive acts of legislation which were adopted in the various States.

Stock Exchange and Legislation. The striking legislation of the year 1934 amendatory to that of 1933 and embodied in the so-called Securities Exchange Act of 1934, continued in operation but without amendment except so far as administrative changes tended to alter the application of it. The rounding out of the system of administrative control and oversight, however, was effected during the year by the issuance of numerous regulations, many of them amendatory to those earlier issued and resulting in subjecting almost every act of the brokerage or investment banking houses to Federal oversight and control. Branch offices with enormous staffs were established by the Securities Exchange Commission in various States and, while on the whole the financial community was of the opinion that the Securities Exchange Commission had been about as considerate of its interests as it could be under the existing circumstances, it nevertheless continued to regard the legislation in question as unavoidably a serious limitation upon its operations.

One of the outstanding events of the latter part of the year was the action of the Commission in bringing to trial a well-known Stock Exchange operator upon the charge that he had "manipulated" a given aircraft security. The evidence adduced by the attorneys for the Commission was not of a very convincing sort, but suggested to the financial community the thought that if practices of the kind described were to be regarded as tabu for the future, it would be very difficult for the brokerage community to engage in anything except the straight buying and selling of securities upon individual orders received from cash buyers and sellers or, in other words, that the character of Federal control suggested by the trial was being carried very much beyond anything that had previously been indicated. It seemed to them, in short, that the Federal government was proposing not merely an oversight of methods and types of issue and trading in securities, but also a constant scrutiny of individual transactions which might be attacked or tolerated according to the personal preferences of those who happened to be in charge at the time.

New Issues. For a good while it had been customary to say that while there might be extensive recovery or activity in consumption goods

industries, the real test of the restoration of business was to be found in the action of securities representing producers goods and in the restoration of the demand for new issues representing bona fide investments. During the year 1935 the volume of such new issues (bonds) was greatly restored, approaching the figure of \$1,438,000,000 new, and \$3,284,000,000 refunding loans. Profits on the whole were considerably less than previously, the operations of the Securities Commission having been effective in limiting the terms upon which issue houses were willing to bring out the new securities. Then, too, it was a fact, that a great many of the new issues were for refunding and therefore represented nothing more than the desire of enterprises to take advantage of the extremely low rates of interest prevailing in the market which had been established under the leadership of the Treasury as a working out of its endeavors to obtain low cost financing for itself.

When all allowances had been made however, the new security developments of the year showed a degree of elasticity and new vigor which was regarded by the community as decidedly encouraging. The extensive issues of the Treasury Department continued to be placed on the market at about the same rate as ever, and were proportionate to the great deficit of the Federal government. Borrowings of States and municipalities were also large, the practice of over-spending as compared with income being still very general. Foreign issues although extensively traded in were not placed upon the market de novo owing to the restrictions of the Johnson Act which continued in operation. No success was had in mitigating to any perceptible degree the foreign exchange restrictions imposed by the different countries of the world, so that as a result the movement of capital and the floating of securities on foreign behalf was as badly handicapped as ever.

The following table furnishes the essential data with respect to the operations of the year:

SUMMARY OF NEW FINANCING ^b (IN MILLIONS OF DOLLARS)

Year	Total domestic and foreign	Total domestic ^a	Domestic, new issues			Foreign, new issues	Refunding issues, domestic and foreign
			State and municipal	Bonds, notes	Corporate Stocks		
1923	4,417	4,016	1,043	1,976	659	421	682
1924	5,557	4,588	1,380	2,200	829	969	759
1925	6,201	5,125	1,352	2,452	1,153	1,076	925
1926	6,314	5,189	1,344	2,667	1,087	1,125	1,046
1927	7,556	6,219	1,475	3,183	1,474	1,337	2,220
1928	8,040	6,789	1,379	2,385	2,961	1,251	1,858

1932	1,196	1,166	762	305	20	29 ^c	538
1933	720	710	484	40	120	12	344
1934	1,386	1,386	803	144	35	...	826
1935 ^a	1,438	1,438	884	344	69	...	3,284

^a Includes issues of Federal land banks and Federal intermediate credit banks, not shown separately. ^b Long-term; i.e. 1 year or more.

Sources.—For domestic issues: Commercial and Financial Chronicle; for foreign issues (issues publicly offered) annual totals are as finally reported by Department of Commerce. Also *New York Times Annual Financial Review*

New listing requirements of a stringent character enforced by the Securities Exchange Commission practically took the issues of various foreign governments off the list owing to the fact that these governments were not willing to file the information required by the Commission in question. Other regulations of the Commission including publicity for the dealings of corporate officers led various concerns to withdraw their securities from trading. As a whole, the situation still remained unsettled up to the end of the year in these particulars.

Movement of Gold. Reference has elsewhere

been made (see article on BANKS AND BANKING) to the important banking legislation of the year 1935 and to the efforts at manipulation of Reserve requirements which grew out of it. These pieces of legislation had a less direct effect upon actual market conditions than had been true during the preceding year but they nevertheless exerted an influence. More directly important perhaps was the continued disturbance of the monetary policies of foreign countries, which continued to be troublesome and which had the effect of leading to irregular and unaccountable movements of gold. In the same way the continued disturbances of tariff relationships and the international economic warfare represented by tariff changes and quota restrictions designed to neutralize the effect of monetary measures and devaluations upon international trade, furnished a difficult factor and one which could not be reckoned upon.

The inward movement of one and three quarter billion dollars of gold was accompanied by the maintenance of a small favorable merchandise balance of trade somewhat aggravated by the

^a Since Jan. 31, 1934—\$1 = 159 $\frac{1}{2}$ grains of gold $\frac{9}{10}$ fine; i.e. an ounce of fine gold = \$35.

European war conditions which, during the latter part of the year, tended to bring about larger than normal purchases of staple articles in the United States for shipment to Italy. Had it not been for the falling off in general trade which inevitably followed the restrictive measures of earlier years, the trade balance of the United States would have been still more seriously disturbed. Renewal of the difficulties of the "gold bloc" at mid-year and again toward the latter part of December, tended to aggravate the movement of gold and to place stabilization of international financial relationship further and further out of the question.

Toward the end of the year, the United States was informed by its principal foreign war debtors that nothing could be expected from them for the current season; and the Secretary of the Treasury after a lengthy visit abroad, came home with the announcement that, in his opinion, international monetary stabilization was further off than had been the case several months before. In such circumstances, the gradual rise of the gold stock of the United States to more than \$10,000,000,000 naturally furnished a seriously alarming note in connection with the specie situation and the monetary structure of the world community as a whole.

International Balances. As already noted, the specie balance between the United States and other countries was seriously disturbed during the year 1935, but the inward movement of funds resulting from unbalanced merchandise trade was smaller than usual, whereas the net sum due to the United States had been \$478,000,000, it seemed during many months of 1935 as if our exports would hardly more than balance our imports and it was only after the development of a large war trade with Italy that this outlook was materially altered. In the final analysis the American favorable merchandise balance was raised to near \$100,000,000; but even this situation, developed under peculiar conditions to which reference has already been made, represented a noteworthy deterioration of the international trade balance as shown in the accompanying table.

Mention should be made of several reciprocity treaties which the Secretary of State succeeded in negotiating and for which he had obtained presidential approval. The latest and most considerable of the series was that with Canada, which became public at the end of November and immediately aroused severe criticism from protectionist industries, especially among the protectionist clique which had more and more come to be dominant in American agriculture. Hardly had the treaty been widely publicized when it was announced that demand would be made for a review of it by Congress, notwithstanding that the latter body had placed in the hands of the President the power to negotiate such agreements. The resignation of one of the leading officials of the "New Deal" in Washington, on account of his dissatisfaction with the Canadian treaty, illustrated the extreme to which the inner group of protectionists in the Democratic Party was disposed to carry their attitude. Particular criticism was visited upon the Canadian treaty because of the fact that it was said to run counter to the policy of the administration, as expressed in its efforts to advance agricultural development. As the treaty required ratification from the Parliament of Canada, it was still uncertain up to the end of the year whether it would or would not become an actual operat-

ing agreement between the two countries, so that it had no effect upon actual business so far as the year 1935 was concerned. The official comparison of the "balance sheet of the United States" for 1933 and 1934 is shown on page 241.

In reviewing the history of International Trade during the year 1935, the striking features affecting foreign exchange appear to be not unexpected movements of goods or capital, but the shipments of actual money—largely gold—from one country to another, due to the uncertainty surrounding the standard of value in various nations. This "panic-stricken movement of money from one capital to another" occasionally lowered and at other times drove upward the principal European currencies. Toward the end of the year the principal burden of the situation appeared to be borne by the so-called "gold bloc" countries and, particularly, by France.

An enormous flow of gold into the United States added to our stock of the metal about one and three quarters billions of dollars; while the strain growing out of the hysterical movement of funds caused a collapse of the postwar gold standard in Belgium. Serious depression in Switzerland and The Netherlands accompanied their currency difficulties, while the United States, already over-supplied with gold, probably received some inflationary impetus from the movement. In the table on page 239 are sketched the changing quotations for foreign exchange applicable during the past year.

FINE ARTS. See ART EXHIBITIONS; ART MUSEUMS; LITERATURE, ENGLISH AND AMERICAN; PAINTING; SCULPTURE.

FINGERPRINTING. See LAW.

FINLAND. A republic of Northern Europe. Capital, Helsinki (Helsingfors).

Area and Population. The land area of Finland is 134,547 square miles (water, 17,312 square miles) and the estimated population on Dec. 31, 1933, was 3,738,532 (3,667,067 at the 1930 census). Living births in 1933 numbered 65,047; deaths, 47,960; marriages, 24,472; emigrants, 677. Estimated populations of the chief cities on Dec. 31, 1933, were Helsinki (Helsingfors), 268,592; Turku (Åbo), 69,041; Tampere (Tammerfors), 58,220; Viipuri (Viborg), 71,817. Of the 1930 population, 3,022,257 spoke Finnish and 342,916 Swedish. Both languages are official (Swedish names are given above in parentheses).

Education. The illiteracy rate is less than 1 per cent. The population of school age in 1930 was 679,667. In 1932-33 there were 395,068 pupils in primary and 49,494 in secondary schools. The three universities (2 Finnish at Helsinki and 1 Swedish at Turku) had 7303 students in 1933-34.

Production. In 1930, 60 per cent of the population was engaged in agriculture and 16.8 per cent in industry. The area under crops in 1932 was

Residual item (net) ^g	+ 38 ^h	+ 499 ⁱ

* This item consists roughly of three parts: (1) Exports and imports of goods for which data are available but not recorded in the official trade figures (e.g. ships, bunker fuel sold in the United States, silver, etc.).

^b In contrast with previous classification, items on bankers' commissions, fiscal agents' commissions, brokerage fees, etc., are no longer included in this item but appear in the item, *Miscellaneous Services*.

^c This is a revised figure which exceeds the original entry by \$45,000,000. The revised estimate, like the original, includes certain amounts which were funded during 1933.

^d This is a revised estimate based on the preliminary results of a special survey on foreign-owned investments in the United States.

^e Includes approximately \$59,000,000 held under earmark abroad at the end of 1933 for the account of a government agency.

^f Silver exports and imports were included in *Merchandise Adjustments* until 1934.

^g As indicated in the text of *The Balance of International Payments*, etc. (U.S. Govt. Printing Office), paper currency movements might be appropriately considered under short-term capital transactions.

^h Capital items are viewed as "exports" and "imports" of evidences of indebtedness.

ⁱ This item takes account of all reported security movements between the United States and foreign countries and includes international sales and purchases of long-term issues, new underwriting, sales and purchases of properties not represented by security issues, and security transfers resulting from redemption and sinking-fund operations.

^j This item has been referred to in certain previous bulletins, under such captions as "Discrepancy, due to errors and omissions" and "Unestimated items, errors, omissions, etc." In view of the negligible size of the item in 1933 and its unusually large size in 1934 both headings may be misleading. Owing to the "flight of capital" during part of 1933 it is inconceivable that no substantial errors or omissions entered into any of the estimates of that year and the small size of the residual balance must, therefore, be looked upon as largely fortuitous. On the other hand, the large balance in 1934 is clearly neither a "discrepancy" nor an accumulation of errors. It may be viewed, of course, as an aggregate of omissions in the sense that no attempt is made to identify the various component parts which presumably represent in large part the inflow of various classes of both American-owned and foreign-owned funds from abroad after the devaluation of the dollar, often in a manner that made a statistical record for balance-of-payments purposes impossible.

^k See footnote ^j.

^l See footnote ^j.

5,863,000 acres, or only 6.8 per cent of the land area. The value of the 1934 crops was 5,300,000,000 marks (4,607,000,000 marks in 1935). Crop yields in 1934 included: Wheat, 3,327,000 bu.; rye, 15,582,000 bu.; barley, 9,599,000 bu.; oats, 53,090,000 bu.; potatoes, 42,622,000 bu. Livestock in 1933 included 1,745,000 cattle, 973,000 sheep, 435,000 swine, and 357,000 horses. The 1933 butter production was 52,412,000 lb.; cheese, 15,126,000 lb. The value of industrial production totaled 10,837,000 marks in 1933 (9,556,000 in 1932). There were (1933) 3527 large industrial establishments, with a total of 140,736 workers. Paper, wood products, foundry products, and textiles were the chief manufactures. The number of sawmills in 1933 was 459.

Foreign Trade. General imports in 1934 were valued at 4,772,100,000 marks (3,926,000,000 in 1933) and exports at 6,217,000,000 marks (5,288,200,000 in 1933). The United Kingdom supplied 22.9 per cent of the 1934 imports by value (20.6 in 1933); Germany, 20.7 (27.5); United States, 8.6 (7.3). Of the 1934 exports, the United Kingdom

took 46.8 per cent (45.8 in 1933); Germany, 10.1 (9.8); and the United States, 6.9 (8.7). Leading exports were (in 1000 U. S. gold dollars): Wood pulp, 19,293; rough boards, 12,351; battens, 9970; newsprint, 5406; plywood veneers, 3842. Metals and manufactures, machinery, chemicals, coal and coke, and raw cotton were the leading imports by value.

Imports in 1935 totaled 5,344,100,000 marks; exports, 6,203,900,000 marks. U.S. statistics showed general imports from Finland in 1935 of \$12,157,788 (\$8,995,483 in 1934) and exports to Finland of \$6,107,794 (\$5,993,945 in 1934).

Finance. Closed budget accounts for 1934 showed total revenues of 4,136,000,000 marks (current revenues, 3,367,000,000 marks) and expenditures of 4,101,000,000 marks (current expenditures, 2,599,000,000). Budget estimates for 1935 balanced at 3,356,000,000 marks; and for 1936, estimates were: Receipts, 3,841,500,000 marks; expenditures, 3,838,200,000 marks.

The public debt on June 30, 1935, totaled 3,294,-

000,000 marks (foreign, 1,940,000,000; internal, 1,354,000,000). On June 30, 1934, it totaled 3,349,000,000 marks. The mark (par value as of Apr. 1, 1935, \$0.0426) exchanged at an average of \$0.0187 in 1933 and \$0.0223 in 1934.

Communications. On Jan. 1, 1934, there were 3464 miles of state-owned railway lines and about 160 miles of private lines. The government railways in 1933 carried 18,120,000 passengers and 10,491,000 metric tons of freight. Main highways extended 20,190 miles; other roads, 17,950 miles. There are 2500 miles of navigable waterways. The net register tons of overseas shipping entering the ports in 1934 was 5,379,000 (in 1933, 4,677,000). Air lines connect Helsinki with Turku, Tallinn (Reval), and Stockholm.

Government. Executive power is vested in a president elected for six years by 300 electors, chosen by direct suffrage in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 300 members of the Diet are elected by direct vote of all citizens over 24. The cabinet is appointed by the President but is responsible to the Diet. President in 1935, Pehr Evind Svinhufvud, elected Feb. 16, 1931. Premier, Toivo Mikael Kivimäki, heading a coalition cabinet appointed Dec. 14, 1932.

History. Economic conditions in Finland during 1935 continued the marked improvement recorded in the previous year. The average number of registered unemployed declined from 17,139 in 1933 to 10,011 in 1934 and 7163 in 1935. The index of industrial production (Base 1929 equals 100) rose from 95.8 in 1933 to 110 in 1934 and 117 for the first nine months of 1935. The national income from taxes, duties, and dividends increased to almost 3,500,000,000 marks in 1934 from 2,500,000,000 marks in 1932. Under these relatively prosperous conditions the government was able not only to continue its payments on the war debt to the United States (see REPARATIONS AND WAR DEBTS) but also to announce substantial tax reductions in the 1937 budget estimates. The lower limit of taxable income was raised from 6000 to 10,000 marks and property valued at under 100,000 marks was exempted as compared with the former limit of 40,000 marks. The tariff on rye, wheat, sugar and coffee was lowered and the military budget and allowances for dependent children were increased. The foreign debt was substantially reduced and the outstanding foreign and domestic loans were in process of conversion to substantially lower interest rates.

As agriculture was relatively less prosperous than industry, the government assisted the farmers by granting premiums on exported animal foodstuffs, by attempting to stabilize the wholesale price of butter at 24 marks per kilogram, and by supporting the prices of domestic animal fats. The sum of 135,000,000 marks was set aside in the 1935 budget for the payment of export premiums. A government commission was also appointed to study the extension of the compulsory old-age and health insurance system.

Favorable economic developments were reflected in the relative quiescence of domestic politics. The agitation among Finnish nationalists for restriction of the language privileges accorded the Swedish-speaking minority in the Constitution flared up again and aroused considerable ill feeling among the Swedes both in Finland and Sweden. A special session of the Diet was called on January 17 to consider a bill regulating the use of Swedish at Helsinki University. This government

measure, while strongly criticized in Sweden and the other Scandinavian countries, was attacked by the Finnish nationalists as too lenient. Finnish-speaking students struck for two weeks in protest against the measure. While Opposition forces in the Diet systematically obstructed action upon the bill, the nationalists conducted demonstrations outside and even went to the length of defacing Swedish signs.

The Diet finally adjourned without taking action on the bill. The nationalists then demanded a country-wide referendum on the language question, but this was rejected by Prime Minister Kivimäki. The Agrarians, who opposed the government on this issue, expelled from the party their two representatives on the Cabinet for supporting the government's language policy. In contrast with the Finnish agitation, the Swedish Riksdag in February passed a bill granting Finnish-speaking inhabitants of eastern Sweden the right to have Finnish-speaking teachers in the primary schools.

The language dispute threatened to affect the political orientation of Finland towards Sweden and the other Scandinavian States. Both Germany and Poland made overtures to Finland during 1935 in an apparent effort to secure her cooperation in the establishment of an anti-Soviet front. An emissary of Alfred Rosenberg, the Nazi publicist, was the leader of an active National Socialist movement in Finland and he established friendly relationships in official circles. In the middle of August the Polish Foreign Minister, Col. Josef Beck, paid a four-day visit to Helsinki. The indications were, however, that the majority of the Finns still remained attached to the Scandinavian bloc, with its emphasis upon peace and support of the League of Nations. The Finnish Foreign Minister attended the meeting in Oslo on August 29 of the Foreign Ministers of the three Scandinavian States, and early in December the Socialist Premiers of Denmark, Norway, and Sweden conferred in Helsinki with Finnish Socialists on the problems of the Baltic and Northern Europe. Military cooperation among Finland, Sweden, Estonia and Latvia in the event of war in the Baltic was reported to have been discussed at a meeting of representatives of the four powers in Helsinki in November. See ESTONIA and LATVIA under History.

The friendly sentiment evidenced towards Nazi Germany by conservative elements in Finland during the year was partly the result of the continuance of friction between Finland and the Soviet Union over the question of Finnish cultural rights in Soviet Karelia. Late in 1935 the Soviet authorities were reported to have repressed with severity the pro-Finnish agitation in that region. Edward Gylling, Finnish-born former Premier of the Karelian Republic, was said to have been killed by Soviet soldiers while being taken to a Soviet prison camp in the Arctic. The Russians were also reported to have created a safety zone along the frontier by replacing the Finnish-speaking inhabitants with Russians. The Finnish Government was sharply advised to mind its own business when it made an official request for information on these activities.

FIRE INSURANCE. See INSURANCE.

FIRE PROTECTION. The 1935 fire loss was the lowest since 1916. The factors responsible for the downward trend discussed in the 1934 and 1935 NEW INTERNATIONAL YEAR BOOK continued to affect the fire loss, but an upward trend in the monthly loss figures appeared toward the end of

the year. The trend toward curtailment of municipal fire protection was largely checked, and replacement of obsolete fire apparatus began after a period of years during which curtailment of appropriations had prevented proper maintenance.

Federal government emergency agencies, such as the Federal Housing Administration, and the Rural Electrification Administration, promoted fire protection through publicity on the fire aspects of their programmes. Improvement in public water supplies for fire protection was the object of many projects financed by Federal funds, and the erection of modern fire-resistive schools and other public buildings to replace old combustible structures had a desirable effect in reducing fire hazards. Extension of fire alarm systems and modernization of fire stations were also to some extent financed by Federal funds.

The removal of dilapidated buildings, referred to in fire protection circles as "conflagration breeders," proceeded at an accelerated rate, under the combined impetus of a desire on the part of building owners to avoid payment of taxes on buildings that were no longer profitable, and the efforts of municipal fire and building authorities to require the removal of unsafe structures.

The 1935 U.S. Fire Loss. The total fire loss for the year 1935 is estimated at \$259,159,945 by the National Board of Fire Underwriters. The loss by years since 1916 is shown by the following table:

1916	\$258,377,952	1926	\$561,980,751
1917	289,535,050	1927	472,933,969
1918	353,878,876	1928	464,607,102
1919	320,540,399	1929	459,445,778
1920	447,886,677	1930	501,980,624
1921	495,406,012	1931	451,643,866
1922	506,541,001	1932	406,885,959
1923	535,372,782	1933	271,453,189
1924	549,062,124	1934	262,848,122
1925	559,418,184	1935	259,159,945

The following table shows the monthly fire losses during the past three years:

	1933	1934	1935
January	\$ 35,547,565	\$ 28,002,583	\$ 23,430,504
February	36,661,481	31,443,484	25,081,025
March	35,321,248	31,312,359	24,942,703
April	27,825,970	22,028,943	23,267,929
May	24,338,714	25,271,459	21,238,205
June	21,578,609	20,005,692	18,499,095
July	20,004,049	19,484,027	19,293,619
August	23,626,505	19,613,146	18,137,000
September	20,447,571	16,243,870	16,641,882
October	21,465,382	18,236,272	19,785,871
November	22,454,200	20,114,346	20,871,584
December	27,626,439	23,895,879	27,969,288
Total 12 months ..	\$316,897,733	\$275,652,060	\$259,159,945
Adjusted loss figures	\$271,453,189	\$262,848,122	
(Released later in year)			

During the year 1935 there were thirty fires involving a loss reported at \$250,000 or over, a decrease of four from the previous year. Four of these fires were forest and brush fires which occurred on the same day in various sections of Los Angeles County, Calif. The thirty fires occurred in various sections of the United States as shown on the accompanying map.

Of the large loss fires in 1935, the only ones which can be classed as group fires or conflagrations were the series of fires in Los Angeles County on October 23, which together destroyed a total of 222 buildings and caused losses of \$3,617,835, including damage to watershed property.

Fire Department Training. Interest in training schools for firemen reached a new high in 1935. Schools were held at over 350 centres and in nearly every State and province in the United States and Canada with a total attendance of more than 30,000 firemen. A decided trend was noted toward the holding of a larger number of zone and regional schools throughout a State instead of holding one or two State-wide schools. This was largely due to the determination of those interested to reach firemen in the smaller communities (especially the volunteer firemen) that heretofore received but little training in fire prevention and

ANNUAL CONFLAGRATION MAP of the National Fire Protection Association Big U.S. Fires of 1935

fire protection. Schools were sponsored by State and county firemen's and chiefs' associations, state fire marshal departments, insurance inspection departments, State universities, Federal and State departments of vocational education, State leagues of municipalities and other interested organizations.

In New York City Mayor LaGuardia picked 10 men interested in fire prevention to take a four-year course in engineering at the city's expense to qualify them for technical positions in the fire department. The many technical aspects of a fire department require especially trained men to administer them effectively. The modern fire department is becoming more of a scientific municipal agency and less of a purely fire fighting organization.

Technical Developments. A new method of fire extinguishment was developed utilizing a special form of high pressure water spray for extinguishing burning oil and other types of fires not ordinarily susceptible to control by water. Further progress was made in developing chemical treatments for wood and synthetic construction materials to reduce their fire hazard, with particular reference to the use of such materials in passenger vessels. The publication by the National Fire Protection Association of the 8th edition of the Crosby-Fiske-Forster Handbook of Fire Protection was received as a significant contribution to fire protection engineering.

Legislation. The States of Kansas, Kentucky, Nebraska, Vermont, West Virginia, and Wyoming in 1935 adopted the model arson law sponsored by the Fire Marshals Section of the National Fire Protection Association, making a total of 39 States having this desirable legislation. In States actively enforcing such laws the convictions for arson have increased and fire losses due to this crime have generally decreased.

The International Association of Fire Fighters sponsored a general campaign in 1935 for State legislation to place fire department personnel under civil service.

FISHES. See Zoölogy.

FISK UNIVERSITY. A coeducational institution for colored people in Nashville, Tennessee, founded in 1866. The total enrollment of 342 for the autumn of 1935 included 161 men and 181 women. The faculty numbered 48. The productive endowment for 1934-35 amounted to \$1,500,434, and the total income was \$260,075. The library contained approximately 48,000 volumes. President, Thomas Elsa Jones, Ph.D.

FITZMAURICE, EDMOND GEORGE FITZMAURICE, 1ST BARON, OF LEIGH. An English diplomat, died at Bradford-on-Avon, England, June 21, 1935. He was born in London, June 19, 1846, and educated at Eton, where he won the Prince Consort's Prize for modern languages, and at Trinity College, Cambridge, where he graduated first class in the classics and was awarded a prize for English essay. While an undergraduate he was president of the Cambridge Union Debating Society.

Fitzmaurice's first excursion in the political field was as a Liberal member of Parliament, to which he was elected in 1869 to represent Calne. He served until 1885, and in 1888 was elected to represent Cricklade, remaining in the House of Commons until 1905. He was called to the bar at Lincoln's Inn in 1871, and in the following year was appointed secretary to the Rt. Hon. Robert Lowe of the Home Office. In 1880, he was appointed a commissioner for the reorganization of

the European provinces of Turkey and Crete under the Treaty of Berlin, and it has been said that, had his plans for the reorganization been carried out, the World War might have been averted. He next served as Second Plenipotentiary at the Danube Conference of 1882-83. As a member of the Gladstone Ministry from 1882 to 1885, he served as Under Secretary of State for Foreign Affairs. From 1899 to 1905 he served as chairman of one of the standing committees of the House of Commons and in the schism of the Liberal Party over the South African War, he sided with Henry Campbell-Bannerman. Also, he was Under Secretary of State for Foreign Affairs again from 1905 to 1908, representing the Foreign Office in the House of Lords, having been created Baron Fitzmaurice in 1906. In 1907 he was first plenipotentiary at the London Conference on the African sleeping sickness. For the year 1908-09 he was Chancellor of the Duchy of Lancaster with a seat in the Cabinet.

Lord Fitzmaurice was known as a scholar as well as a diplomat, for the biographies he wrote revealed wide research and historical scholarship. He was the author of *Life of Lord Shelburne*, (1875-77); *Sir William Petty, the Political Economist* (1895); *Life of Granville Leveson Gower, Second Earl of Granville* (1905); *Charles William Ferdinand, Duke of Brunswick*. He also contributed to various periodicals and edited *Letters of the Abbé Morellet* and *Letters of Gavin Hamilton*, the art collector.

FIVE-YEAR PLAN, SECOND. See UNION OF SOVIET SOCIALIST REPUBLICS.

FLAGSTAD, KIRSTEN. See MUSIC under Artists.

FLAX. The 1935 flaxseed production of 13 countries reporting to the International Institute of Agriculture estimated at 36,642,000 bu. was 52.7 per cent above the production of 23,994,000 bu. in 1934 and 7 per cent above the average annual yield for the five years 1929-33. The acreage of these countries, 6,358,000 acres, was 30.1 per cent greater than the area in 1934. The yields of the leading producing countries exclusive of the United States were estimated as follows: India 16,720,000 bu., Lithuania 1,539,000 bu., Canada 1,433,000 bu., Latvia 928,000 bu., and Germany 634,000 bu. The Soviet Republics reported a yield of 27,558,000 bu. in 1934 and an average of 30,021,000 bu. for the five years 1929-33. Argentina, the leading flaxseed producing country of the world, reported a yield of 79,721,000 bu. in the crop year 1934-35 and an average annual yield of 68,404,000 bu. for the five years ending with the crop year 1933-34.

According to estimates by the U.S. Department of Agriculture the production of flaxseed during 1935 in the United States was 14,931,000 bu., nearly three times the short crop of 5,213,000 bu. in 1934 but 6.5 per cent less than the average of 15,961,000 bu. for the five years 1928-32. The area harvested in 1935, 2,071,000 acres, was more than twice the 969,000 acres harvested in 1934 when drought and high temperatures caused the abandonment of a large acreage. Most of the increase in acreage in 1935 occurred in the Dakotas and Minnesota. The average yield per acre was 7.2 bu. compared with 5.4 bu. in 1934 and 6.9 bu., the average for the 10 years 1923-32. Among the 11 States reporting flaxseed production Minnesota ranked first with 6,450,000 bu., North Dakota second with 6,030,000 bu., South Dakota third with 912,000 bu., and California fourth with 570,000 bu.

The 1935 flax fibre production of ten countries

reporting to the International Institute of Agriculture was estimated at 290,070,000 lb., an increase of 49.4 per cent over the 1934 production and an increase of 63.8 per cent over the average for the five years 1929-33. The leading fibre producing countries and their yields were reported as follows: Lithuania 79,184,000 lb., Belgium 61,730,000 lb., Latvia 58,662,000 lb., and Germany 27,556,000 lb., Northern Ireland in 1934 reported a yield of 8,236,000 lb.

During the fiscal year ended June 30, 1935, the United States exported 159,000 long tons of linseed oil cake, 11,000 long tons of linseed oil-cake meal, and 795,000 lb. of linseed oil and imported 14,463,000 lb. of linseed oil cake and oil-cake meal, 1,722,000 lb. of linseed oil, 9,104,000 bu. of flaxseed, and 2 long tons of unmanufactured flax fibre.

FLEMISH AUTONOMY MOVEMENT.

See BELGIUM under *History*.

FLOOD CONTROL. The most important flood protection works now under way are the Mississippi River work, which has been a continuous problem for many years, the Muskingum Flood Control in Ohio and the San Gabriel Work in California.

A revised plan for the Mississippi flood control was submitted to the Committee on Flood Control of the House of Representatives by General Markham, Chief of Engineers (see *Eng. News-Record*, April 4). This plan eliminated most of the objections which had been raised to the original, so-called Jadwin plan of 1928. The estimated cost of this new plan, including the completion of constructions retained from the Jadwin plan, was put at 313 million dollars.

It will be recalled (see 1928 YEAR BOOK) that the principal criticisms of the Jadwin plan were due to the fact that it was planned to leave large areas of the valley subject to occasional overflow during exceptional floods—the relief floodways. The new plans reduce greatly these areas by means of proposed new flood levees and the estimate also includes compensation for owners of lands subjected to overflow. This latter item was a stumbling block in the original estimates (see 1929 YEAR BOOK).

The Muskingum Flood Control project in Ohio, a work involving some 13 earth dams, went forward during the year and is now approximately one-third completed.

The San Gabriel Flood Control has been noted in previous YEAR BOOKS, particularly the difficulties in finding suitable dam sites. This project is actually a combination of flood relief and water conservation. The plan is to reduce flood conditions through storage and to release stored water gradually so as to replenish ground water in an extensive irrigated area in which water for irrigation is secured through pumping from wells.

FLOODS. In general, the floods which occur when natural streams of inland regions overflow their banks may be grouped into two classes. One type is the local flood over the land bordering a small stream, which is confined to a relatively small region; if the small region is not densely populated little damage is done, but if it is thickly settled great damage may be caused by a local flood. The other type is the flood over land bordering a large stream. Both classes of floods are caused by heavy rains (occasionally supplemented by melting snow). While there is no sharp line of demarcation between the two types of floods, it may be said that: (1) the average intensity of the rainfall over the drainage area which causes

a local flood must be considerably greater than that causing a flood in a large stream, before much outside public interest is attracted to the local flood; (2) local floods are of short duration while floods in large streams may last weeks or months; (3) at the present state of the meteorological and hydrological sciences it is impossible to predict the occurrence of local floods, while floods in large streams can usually be accurately predicted and most governments maintain services for this purpose. The seacoasts sometimes experience a flood of a third class; such floods are not due to rains but result from the so-called tidal waves caused by earthquakes or terrific windstorms.

The year 1935 was unusual as regards floods in the United States. In the first place, although there were numerous floods in the large streams, few were of more than passing interest, the most important one being the flood in the lower Missouri Basin during May and June. Secondly, there was an unusual number of severe local floods. These local floods caused so much damage that the total loss to life as well as to property exceeds that of any year since 1927 when the great flood took place in the Mississippi River.

The small streams near Memphis, Tenn., reached unusually high stages in January and considerable damage was caused to property there. The high water in Wolf River broke several steamboats away from their moorings in Memphis.

During March there were severe floods in the White and St. Francis River systems of Arkansas and southern Missouri. At many places on the tributary streams of these rivers the flood waters reached higher stages than previously recorded. Many breaks occurred in the levees there. Farmers fled, abandoning household goods and livestock. Four companies of the Missouri National Guard were called out and sent to the flooded area to preserve order and assist the flood-stricken people. The Red Cross aided 25,000 flood refugees. Four persons were drowned.

There was an important flood in the Green River in Kentucky which began in March and ended in April. From a monetary standpoint this flood was the most disastrous one of record in the lower Green River Valley. The flood waters did not reach stages quite so high as during the great flood of 1913 there, but due to the development of property interests through the intervening years the losses were much greater in the 1935 flood than in the greater inundation of 1913. At Rumsey, the Green River is about 500 feet wide at an ordinary stage, but on April 13, the day of the 1935 crest, it was 14 miles wide. McLean County was most seriously affected; about 40 per cent of this county was inundated. For a while there was much apprehension lest disease break out in the flood-stricken section, but prompt measures taken by governmental agencies quickly allayed this fear.

In April heavy rains and melting snows caused floods in the Sacramento River System in California. Water from the river backed up into the first floor of the State Capitol, as well as many other buildings. Five persons were drowned.

Portions of the Tallahatchie and Yazoo valleys in Mississippi were under water from January to May. Thirteen persons were drowned by these floods. There was a high flood in the Red River during May. Beginning in March and ending in May a flood crest passed down the Lower Mississippi River. Almost immediately it was followed by another crest which ended early in July. These lower Mississippi floods caused damage, but much

less than that caused by the last previous flood (1933) there.

There were exceptionally heavy rains on May 30 and 31, over Northeastern Colorado and adjoining portions of Nebraska and Kansas. These rains caused unprecedented floods in the Republican River as well as in the streams of the upper South Platte Basin. Ordinary creeks and arroyos soon became raging torrents and the highest water in the memory of the white man occurred at all places in this region. These floods caused the loss of 19 lives in Colorado, 104 in Nebraska (all along the Republican River), and six in Kansas. Among all the streams in this region, the Republican River caused the most destruction. Although the rains were heaviest in the upper reaches, the flood extended throughout the length of this river in Nebraska and Kansas. About 250,000 acres of land in Nebraska were flooded, being a strip along the river throughout its length in the State (210 miles), and from 1 to 3 miles wide. Besides those drowned, more than 1000 families were made homeless and the buildings on more than 600 farms were washed away. Two hundred and thirteen miles of railway tracks were washed away. This flood, was, by far, the worst in Nebraska since the coming of the white man. In addition to the area flooded in Nebraska, about 80,000 acres were inundated in Kansas by the Republican River.

At the time of the flood in the Republican River there were floods in all of the remaining rivers of the Kansas System, but none approached the disastrous proportions of the Republican.

Heavy rains in Missouri during May caused floods in the Grand, Osage and lower Missouri Rivers. The Missouri River below Herman, Mo., remained above flood stage an unusually long time, the duration of this flood exceeding that of any previous one, and excepting the high water of 1903, reached the highest stage since 1844. A noteworthy feature of the floods in the Missouri Basin was the fact that no appreciable damage resulted in Kansas City. The Kansas River enters the Missouri here and although the Kansas, Osage, and Grand Rivers were very high the Missouri above Kansas City was not in flood.

Heavy to excessive rains over the watersheds of the Colorado, Guadalupe, and Nueces Rivers (all in Texas) from June 12 to 16 caused unprecedented floods in these river systems. The highest stages known occurred at Marble Falls, Austin, and Smithville on the Colorado; and at New Braunfels and Victoria on the Guadalupe; and at Cotulla on the Nueces. Thousands of pecan trees were uprooted when the flood waters inundated groves bordering the rivers and many farm buildings were washed away. Damages were also heavy to bridges and highways, and eight persons were drowned.

During July there were disastrous local floods in New York State and northeastern Pennsylvania. Over that part of New York extending from northern Steuben County eastward to northern Delaware County new records for precipitation were established by heavy rains, and the accompanying floods caused record breaking stages in practically all of the small streams there. The heaviest rainfall fell over an area extending from Keuka Lake to the middle of Chenango County and covering the divide between the Finger Lakes drainage to the north and the Susquehanna and Delaware drainage to the south. The intensity of the rainfall decreased rapidly with increasing distance from this area. In this part of New York

and Pennsylvania the topography is rough; many small streams flow into glacial valleys and the slope of the streams is steep. The heavy rainfall brought many of these streams to high flood peaks so suddenly that people were caught practically unaware and trapped in houses, automobiles, and cottages along lake shores. During the early hours of July 8, creeks whose summer flow is usually negligible were many feet deep and flooded the cities, towns, and villages. Trees, buildings, and other debris jammed bridges and culverts, thus diverting the streams or damming them temporarily. Railroads and highways were washed out, bridges and buildings were carried away and fields were deeply gullied and stripped of top soil or buried under gravel. There were 52 persons drowned.

A sudden flood during the night of July 11-12 in the Granada Creek Valley of Colorado drowned eight persons while asleep in their home. Much damage was also done to property.

Near Dragoon, Ariz., on August 28, a transcontinental bus was parked on high ground awaiting the abatement of flood water from nearby mountains, when a wall of water suddenly came, lifted the heavy bus with its 29 passengers and crew and washed it away. Fortunately 24 of the people escaped with their lives, though three of these were injured.

There were unusually heavy rains in the Muskingum River Valley during August. The resulting floods came at about the height of harvest and damage was severe.

There were three floods of note during September; all were local floods. One was in the lower James River in Virginia; this river was very high (the stage at Richmond was higher than since 1877) but little damage was reported. The second was the one in the Rio Grande from Elephant Butte, N. Mex., to El Paso, Tex. The third was in southern Delaware and eastern Maryland. All the small streams here reached exceptionally high stages; damage was extensive and in Federalburg, Md., many people were made homeless.

A flood took place in Buffalo Bayou on Dec. 9, 1935. This stream flows through Houston, Texas, and as the flood reached a height 7 feet higher than the 1929 flood (the maximum previously recorded there) much damage was done.

FLOOD LOSSES IN THE UNITED STATES IN 1935

<i>Drainage</i> ^a	<i>Reported losses</i> ^b	<i>Lives</i>
Great Lakes	\$ 13,185,000	..
Atlantic Slope	16,391,383	52
Gulf (except Mississippi)	28,745,747	22
Mississippi (except Ohio)	59,783,835	177
Ohio	8,534,626	5
Pacific Slope	557,150	5
Total	\$127,197,741	261

^a There were no losses reported in other Drainage Areas.
^b Probably about 75 per cent of actual.

FLORIDA. Population. On Apr. 1, 1930 (Fifteenth Census), 1,468,211; July 1, 1934, by latest Federal estimate, 1,575,000; 1920 (Census), 968,470. Jacksonville had (1930) 129,549 inhabitants; Miami, 110,637; Tampa, 101,161; Tallahassee, the capital, 10,700.

Mineral Production. The production of phosphate rock, the main mineral activity in the State, increased in quantity to 2,369,334 long tons for 1934, from 2,136,123 for 1933; in value, to \$8,076,317 (1934), from \$6,417,110 (1933). The greater rise in total value resulted from an increase of the year's average value per ton, by 41 cents, to \$3.41.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges	1935	16,000,000*	\$28,000,000
	1934	17,600,000*	26,887,000
Grapefruit	1935	10,500,000*	12,075,000
	1934	15,200,000*	11,801,000
Corn	1935	671,000	6,374,000	4,143,000
	1934	639,000	6,390,000	5,048,000
Peanuts	1935	256,000	163,840,000 ^b	4,588,000
	1934	245,000	142,100,000 ^b	4,121,000
Potatoes	1935	26,000	2,288,000	3,089,000
	1934	25,000	3,250,000	3,705,000
Cotton	1935	86,000	29,000 ^c	1,491,000
	1934	91,000	28,000 ^c	1,705,000
Sweet potatoes ..	1935	22,000	1,870,000	1,683,000
	1934	20,000	1,800,000	1,710,000
Tobacco	1935	9,800	8,680,000	2,398,000
	1934	6,700	5,216,000	1,583,000

* Boxes, ^b Pounds, ^c Bales.

Education. An act of the Legislative session of 1935, whereby the State would guarantee help to counties to maintain eight months a year of public-school instruction, was found unconstitutional by the State Supreme Court in November. In spite of this, the Governor declared that State aid would be given.

Charities and Corrections. A Board of Commissioners of State Institutions, under the system in force during 1935, was the central agency of supervision for the State's institutions having care and custody of persons. These institutions were the following six: Florida State Hospital for the Insane, at Chattahoochee (population at the end of 1935 about 4000); Florida Industrial School for Boys, at Marianna (about 500); Florida Industrial School for Girls, Ocala (about 90); Florida State Penitentiary, Raiford (about 1500, not to count virtually as many more convicts distributed in road camps to perform work on highways); Florida Farm Colony for the Feeble-Minded and Epileptics, Gainesville (about 500); and Florida State Farm No. 2, at Belle Glade (about 150).

Legislation. Among the acts of the regular biennial legislative session convened in April was the creation of a State planning board somewhat on the model of the National Planning Board of the Federal Government; the act authorized the several counties to create planning boards of their own as well. A measure declaring a moratorium for two years on public debts was passed, but Governor Scholtz vetoed it, declaring that "this is no time for Florida to be put in the position of suspending payments." Taxes on business were imposed by requiring occupational licenses that called for payment of fees and by creating a levy on gross receipts. Both these imposts were graduated in accordance with the number of shops under one ownership: the single shop must pay \$10 a year for a license and 1 per cent of its receipts of the year previous; the shop in a chain of 16 or more, \$400 for a license and 5 per cent of gross receipts. Measures were passed to facilitate the Federal creation of the Everglades National Park. A quick-divorce act was passed, reducing the required term of residence of applicants for divorce to 90 days, from one year.

Political and Other Events. The constitutional change of 1934 exempting homesteads below the valuation of \$5000 from the tax on property bred conflict. The State Comptroller advised county commissioners that such homesteads must not be put on the tax rolls, but the Hillsborough County Attorney held on the contrary that they must. Suits were entered in Federal courts against the

exemption of homesteads from taxation when they had been liable for public indebtedness before the change of 1934 had been effected.

A Federal undertaking to dig a canal for ships across Florida (the Gulf-Atlantic Ship Canal) from Jacksonville to Port Inglis, via Palatka, at a cost of some \$146,000,000 was begun in September. Jacksonville and the other places along the route strongly approved the scheme, but sentiment in some other areas opposed it. The argument was advanced that cutting to tide level would be likely to sever underground passages in the limestone deposits supposed to carry to the central part of the State the water nourishing the great flowing springs of the area. Placards were displayed, reading: "What shall we do without water?" A Water Conservation Committee busied itself to check the project.

The State's act of 1933 permitting the State and its subdivisions to receive at par value the bonds of the State, counties and statutory districts in payment from acquirers of real estate forfeited for non-payment of taxes was declared unconstitutional by the Federal Circuit Court at New Orleans. A special form of government by commission was established for Key West and its environs, forming Monroe County. The voters were to elect one of three commissioners, the State to appoint another, and the Federal Government the third.

Economic conditions in the State were mixed. The State Hotel Commission reported on April 4 that the State's resorts had passed the most profitable winter since that of 1925-26; that 1,750,000 visitors had spent an estimated \$625,000,000 in the State. Banks in Miami reported deposits 25 per cent higher in the aggregate than a year earlier. On the other hand 1500 needy people marched to the city hall of Miami on July 31 to influence the city commission to vote more funds for their support.

A hurricane devastated a stretch of the Florida Keys on September 3, taking several hundreds of lives. The victims for the most part were occupants of special camps for war veterans, which had been established by the FERA (q.v., under UNITED STATES; *Administration*).

Officers. The chief officers of the State, serving in 1935, were: Governor, David Sholtz; Secretary of State, R. A. Gray; Attorney-General, Cary D. Landis; Comptroller, J. M. Lee; Treasurer, W. V. Knott; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

Judiciary. Supreme Court: Chief Justice, J. B. Whitfield; Associate Justices, Rivers Buford, W. H. Ellis, Armstead Brown, Glenn Terrell, Fred H. Davis.

FLORIDA, UNIVERSITY OF. A State institution of higher education for men, in Gainesville, Fla., established in 1853. In the fall of 1935 the registration totaled 2868; in the summer session of 1935, it was 1602. The faculty numbered 165. The endowment was \$261,796 and the instructional and operating cost was \$665,054. The library contained 118,580 volumes. The P. K. Yonge Laboratory School, opened in 1934, had an enrollment of 472 students. A photographic laboratory was completed and the new Student Union Building was almost ready. The General College, a two-year general curriculum for all entering students, was opened in the fall of 1935 with 853 students. President, John James Tigert, LL.D.

FLORIDA CANAL. See CANALS.
FLORIDA STATE COLLEGE FOR WOMEN. An institution for the higher education

of women in Tallahassee, Fla., founded in 1905. The enrollment for the autumn of 1935 was 1676. The summer session had an attendance of 872. The faculty numbered 138 members. The income from State appropriations was \$383,172, and from all other sources, \$73,565. There were 57,309 volumes in the library. An education and psychology building was completed in July, 1935. President, Edward Conradi, Ph.D.

FLOTATION. See METALLURGY.

FOOTBALL. Three teams, undefeated, dominated the 1935 football season. They were Princeton University in the East, the University of Minnesota in the mid-West, and Southern Methodist University in the Southwest and their achievements were of such high caliber as to leave experts groping for suitable adjectives and for some method of determining the best of the three. Princeton signified that it would decline a bid to play Stanford, Pacific Coast champion, in the Rose Bowl Jan. 1, 1936, and the University of Minnesota was prevented from participation in any post-season endeavors by the rules of the Western Conference. S.M.U. was chosen after its defeat of Texas Christian U. for its eleventh consecutive triumph of the year.

The teams mentioned were great, but there were a dozen others in the same classification or near it. There was Louisiana State, which lost only to Rice early in the season; Ohio State, beaten by Notre Dame in the final seconds; California, beaten only by Stanford; Holy Cross, unaccountably tied by Manhattan; Army, beaten only by Pittsburgh and tied by Notre Dame; North Carolina, beaten only by Duke. The country probably never had more great football teams in a single year and the college athletic directors and managers experienced a season of financial worth. The sold-out arena was restored to the autumn picture. The Ohio State-Notre Dame, Army-Notre Dame, Army-Navy and Fordham-New York University games being among those sold-out weeks ahead of time. The Southern Methodist-Texas Christian game in Texas was another with national attention turned to it as was the North Carolina-Duke game which attracted the South's greatest football crowd in history.

The season produced its share of upsets. Alabama and Stanford which had met in the Rose Bowl, January 1, with Alabama the winner, met with rebuffs at the outset of the new campaign. Alabama falling before Mississippi State and being tied by Howard, and Stanford losing to U.C.L.A.

For the third year in a row Minnesota, in spite of heavy losses through graduation from the championship squad of 1934, went through the season unbeaten. The Gophers tied for Big Ten honors, tied by Ohio State, beaten only by Notre Dame in a hair-raising game at Columbus, in which Notre Dame scored three touchdowns in the final quarter to wipe out an early and impressive lead. Princeton's fine team included Navy, Cornell, Harvard, Yale, and Dartmouth among its victims, defeating Dartmouth in the final game in a superb exhibition in a blinding snowstorm. Duke won Southern Conference honors and Nebraska gained the Big Six laurels.

Professional football, particularly as presented by the National Football League, continued to gain such popularity that at the close of the year plans were made for the formation of a new major league in 1936, called the American Foot-

ball League. The Detroit Lions, leaders in the Western Division of the league, won the championship, downing the New York Giants, 1934 winners, in the playoff game at Detroit in December, 26 to 7.

FORDHAM UNIVERSITY. A Roman Catholic institution for higher education, under the Society of Jesus in New York City, founded as St. John's College in 1841. It is the largest Roman Catholic educational institution in the United States. The enrollment for 1935-36 totaled 7415 students, including 1413 in the teachers' college and 722 in the graduate school, and a distribution among the other colleges as follows: Law, 896; Fordham College (Bronx Division), 1586; Fordham College (Manhattan Division), 515; school of business, 246; pharmacy, 150; social service, 462; preparatory school, 402. The registration for the summer session of 1935 was 1063. There were 382 faculty members. The endowment fund amounted to \$504,100. There were 130,000 volumes in the library. President, Very Rev. Aloysius J. Hogan, S.J., Ph.D.

FORESTRY. A rational plan for the conservation of natural resources of the country, long the desire of forward looking citizens, came nearer to being a reality in 1935 than ever before. "Never before," says F. A. Silcox in his annual report as chief of the U.S. Forest Service, "have the people of a great country still rich in the foundations of prosperity sought to forestall future disaster by applying a national policy of conservation of which planned land use is the central core." He adds "but to wait always until the forest has been so wrecked that only the public purse can possibly meet the expense of reclaiming it or to limit public lands to lands too poor to make timber production cover its cost would mean to lose sight of the true objective of public forest policy." With an average of 100,000 Civilian Conservation Corps workers in the national forests, plus those on state and private forest areas, more progress was made in the way of building trails and fire lanes, reforestation of denuded areas, destruction of dangerous insects and diseases and cleaning up of fire hazards than would have been accomplished in an ordinary decade. On the other hand, the forests offered the finest possible environment for rehabilitation of young men, their work there fitting them to again take their places in the world at large when opportunity offered.

The abolishment on May 27, 1935, of the Lumber Code promulgated under the National Recovery Act and in effect for a little less than one year, was followed by only slight confusion and moderate changes in prices, the manufacturers and dealers adhering rather closely to the policies adopted under the code. It is thought that the code aided forestry by bringing to lumbermen in general a clearer understanding of the technic and need of sustained yield management with all its accruing benefits in permanent and prosperous industries and communities.

Forest Protection. Fire, ever the enemy of the forest, reaped its toll in the early months of 1935. Up to September 1 there were recorded a total of 7795 fires in the national forests. As compared with an average of 6373 for the same period of the preceding four years, this was a drastic increase, yet numbers failed to complete the story for the total area burned was not much over one half the average. Better organization and training of fire fighting forces, new roads in the forests and the

splendid assistance rendered by CCC workers made possible this more effective control. Critical conditions early in the year in the Southeastern States accounted for almost half the area burned. As an indication of improved skill in combating fires, only 2 workers lost their lives in action as compared with 17 in 1934.

Counted by many as the most serious forest tree disease to appear since the chestnut blight, the Dutch elm disease was fought with great vigor in the region surrounding New York City. More than 600,000 elms were cut and burned in the 4500 square miles of New Jersey, New York, and Connecticut most seriously affected. Apparently distributed by at least one bark beetle species, the disease was found over a wide area but fortunately more or less concentrated in greatest intensity within a comparatively limited zone. To aggravate the situation, outbreaks were discovered in scattered sections of the nation at points in Virginia, Maryland, and Indiana. None would prophesy the outcome of the battle to eradicate this threat to one of North America's finest shade trees but many were hopeful that the favorable action of President Roosevelt in allotting on July 23, \$2,500,000 to continue the fight would bring ultimate success.

Great Plains Shelterbelt, THE. Despite a great decrease in publicity, real progress was made in the spring of 1935 in instituting work on the projected shelterbelt which is planned to extend ultimately from Mitchell, Nolan, Taylor, and Callahan counties in Texas northward to the Canadian border. As proposed, the belt will comprise 100 parallel plantings 10 rods wide and a mile apart, so located as to intercept the prevailing winds. Actually 125 miles of shelterbelt was established in the spring of 1935 in scattered sections in all the States concerned. In addition, 4800 acres were planted on farms within the shelterbelt area. A total of 56 million seedlings were grown for 1936 planting.

National Forests, THE. When the 1,860,117 acres of forest land acquired under the Weeks' Law but not yet transferred into the national forests by proclamation or Executive order were added to the regular accessions, the net increment to the national forests during the 12 months ended June 30 was over two and one-half million acres. This substantial gain was accomplished by purchase, exchange, and actual donation. The largest single accession, 83,042 acres to the St. Joe National Forest in Idaho, was the result of private donations. The report of the National Resources Board issued in 1934 indicated that the national forests should be enlarged by approximately 132,000,000 acres, thus placing the ultimate goal far in the future.

Lumber Trade, THE. Consistent but not striking gains were experienced in the lumber trade during the first nine months of 1935 as compared with the corresponding period of 1934. The values of imported unmanufactured wood, sawmill products, wood manufactures, paper base stocks, and paper and manufactures thereof as presented in the December *Monthly Summary of Foreign Commerce of the United States*, totaled \$177,271,697 in 1934 and \$204,646,457 in 1935. The total values of exports of the same classification were \$89,465,087 in 1934 and \$91,732,720 in 1935. Paper base stocks and paper continued to be the major import items and constitute a rather sad reflection on the ruthless lumbering policies which have resulted in the large idle areas of cut over lands in northern States that might well be producing at least a sub-

stantial portion of the paper base requirements.

The timber cut on the national forests in the fiscal year ended June 30 was over 752 million board feet as compared with 674 million odd feet in the preceding 12 months. At the same time grazing fees were received for over a million cattle, approximately 30,000 horses and over six million sheep. Not the least valuable use of the national forest was recreation. The number of persons making use of the recreational features of the national forests reached a peak in 1935 and promised to climb higher as the trails and bridges constructed by CCC and other workers render the forests more accessible.

Miscellaneous. President Roosevelt, on January 29, was presented by the Society of American Foresters with the Sir William Schlich Bronze Medal in tribute to his notable achievements in the advancement of forestry. The President was the first American to receive this award.

A tablet of bronze was placed in the Harvard Forest at Petersham, Massachusetts, on June 9, in honor of the late Richard T. Fisher, former dean of the Harvard University School of Forestry and Director of the Forest during its first 25 years. President Conant of the University made the principal address and paid splendid tribute to his former friend and associate.

The opening of the Rocky Mountain Forest and Range Experiment Station, with headquarters at Fort Collins, Colo., and serving Colorado, Wyoming, and portions of adjacent States, was a matter of gratification to foresters as it completed the chain of federal forest experiment stations authorized by the McSweeney-McNary Act.

Gifts to the United States of 1680 acres of short-leaf pine forest in southern Arkansas and 1600 acres of typical northern hardwood forest near Williamstown, Mass., both specifically for research, are certain to benefit experimental forestry in the respective areas.

At Lake Placid, on Sept. 12, 13, and 14, 1935, New York State celebrated the completion of 50 years' progress in forest conservation with a fitting programme of papers by prominent local and national leaders.

Necrology. George Dupont Pratt, former president of the American Forestry Association, died at Glen Cove, L. I., on Jan. 20, 1935. Generous in his gifts to further forestry research and education in general, Mr. Pratt was recognized as a militant leader of forces urging the rational conservation of American forests and forest resources.

Bibliography. Many important publications on forestry appeared during the year, among them the following: N. C. Brown, *General Forestry*, New York, 1935; D. Bruce and F. X. Schumacher, *Forest Mensuration*, New York, 1935; E. S. Harrar, *Forest Dendrology*, part i, Seattle, Wash., 1935; R. C. Hawley and M. K. Jessup, *The Practice of Silviculture*, 3d and revised edition, New York, 1935; J. S. Illick, *An Outline of General Forestry*, New York, 1935; D. M. Matthews, *Management of American Forests*, New York, 1935; R. H. Westveld, *Applied Silviculture in the United States*, Photolithographed, Ann Arbor, Mich., 1935; R. G. Wood, *A History of Lumbering in Maine*, Orono, Me., 1935; *A Naval Stores Handbook*, compiled by U.S. Forest Service and Bureau of Entomology and Plant Quarantine, Washington, D. C., 1935.

FORMOSA or TAIWAN. An island belonging to Japan. Area, 13,890 sq. miles including Pescadores Islands (49 sq. m.). Population (1933), 5,060,507 including 4,759,197 natives and 256,327

Japanese. Chief cities: Taihoku, the capital, 275,675 inhabitants in 1933; Tainan, 106,242; Keelung, 80,390; Takao, 72,400; Kagi, 62,963; Taichu, 61,857; Shinchiku, 50,635.

Production and Trade. Rice (45,103,232 bu. in 1934), raw sugar (923,500 metric tons in 1934-35), camphor and camphor oil (exports in 1933 were valued at Y2,728,000), coal (1,533,000 metric tons in 1933), gold (652 kilograms in 1933), tea (9300 metric tons in 1933) are the main products. Livestock (1933): 1,753,963 swine, 286,255 buffaloes, 90,084 goats, 80,851 cattle, and 333 horses. In 1934, total imports amounted to Y215,021,701 of which Japan supplied Y176,990,734; total exports, Y305,928,680 of which Japan took Y279,410,271 (yen averaged \$0.2972 for 1934).

Government. The budget for 1934-35 was estimated to balance at Y110,821,261. For 1933-34, revenue amounted to Y130,812,152, expenditure, Y102,220,615. The government was administered by a Japanese governor-general (in 1935, Kenzo Nakagawa).

History. On Oct. 8, 1935, an air mail and express service was inaugurated between Fukuoka in Japan and Taihoku in Formosa. See EARTHQUAKES.

FORT PECK DAM. See DAMS.

FOULKE, WILLIAM DUDLEY. An American author and publicist, died in Richmond, Ind., May 30, 1935. He was born in New York, Nov. 20, 1848, and graduated from Columbia College in 1869 and Columbia Law School in 1871, being admitted to the bar the previous year. He practiced law for a time in New York City, and became interested in the Young Men's Mutual Reform Association, which assisted in the overthrow of the Tweed ring in New York City politics. In 1876 he moved to Indiana, where he resumed his law practice, paying special attention to railroad law. He was elected to the Indiana State Senate in 1883, serving until 1885, when his refusal to support James G. Blaine for President cost him the renomination. In his last year in the Senate, his bill for the establishment of Civil Service Reform in that State was defeated. Subsequently he organized the Indiana Civil Service Reform Association and was its first president. He was a leader in the investigation of the Indiana State Hospital for the Insane and the disclosures of the grave maladministration of that institution, due principally to the spoils system, aided in breaking the control of the Democratic party in the State.

During the years 1889 to 1890, as chairman of a special commission, Mr. Foulke conducted investigations of the Federal Civil Service and the subjects of Congressional patronage, political changes in the post office, etc., were considered in detail, with the result that the administration of President Harrison was severely censured. The women's suffrage movement claimed his interest about this time, and in 1893 he was chairman of the Suffrage Congress held in Chicago, having previously been president of the American Woman's Suffrage Association.

About 1890 he gave up his law practice to devote all his time to civil reform, particularly in relation to the civil service and the spoils system. President Theodore Roosevelt appointed him a member of the Civil Service Commission in 1901, a position he held until 1903. In 1909 he turned to journalism, which had always held an attraction for him, and for three years was editor of *The Evening Item* at Richmond, Ind. Becoming interested in the Progressive movement through his

friendship with President Roosevelt, he served as a member of the platform committee during the campaign of 1912. For five years, from 1910 to 1915, he was president of the National Municipal League, and from 1923 to 1924 he served as president of the National Civil Service Reform League, and as such headed a delegation to President Coolidge to urge reform in the methods of appointing postmasters.

Mr. Foulke was the author of *Slav or Saxon* (1887; 3d edition, 1904); a biography of *Oliver P. Morton, War Governor of Indiana* (1898); *Maya, a Story of Yucatan* (1900); *Protean Papers* (1903); a translation of Paulus Diaconus' *History of the Langobards* (1906); *Dorothy Day, a novel* (1911); *Maya, a dramatic poem* (1911); *A Hoosier Autobiography* (1922); *Is Our Civilization Really Declining?* (1923); *A Random Record of Travel During Fifty Years* (1925); *Roosevelt and the Spoilsmen* (1925); *Songs of Eventide* (1928); and various papers relating to civil service.

FRANCE. Area and Population. France has an area of 212,728 square miles and a population estimated in 1934 at 41,940,000 (41,834,923 at the 1931 census). The population is half urban and half rural. The movement of population in 1934 was: Births, 677,365 (682,680 in 1933); deaths, 634,525 (661,082); marriages, 298,192 (315,466); divorces, 20,273 (20,699). During 1934 71,538 foreign workmen entered France and 40,104 were repatriated. The chief cities, with their 1931 populations, are: Paris proper, 2,891,020 (4,887,464 with suburbs); Marseille, 800,881; Lyon, 579,763; Bordeaux, 262,990; Nice, 219,549; Lille, 201,568; Toulouse, 194,564; St. Etienne, 191,088; Nantes, 187,343; Strasbourg, 181,465; Le Havre, 165,076; Toulon, 133,263; Rouen, 122,957; Nancy, 120,578; Roubaix, 117,190; Reims, 112,820; Clermont-Ferrand, 103,143.

Education. About 7.4 per cent of the population over five years of age was illiterate in 1931. Primary education is free and compulsory. In 1933 there were 4,723,147 pupils in the elementary schools, 236,501 in secondary schools, and 84,658 in 17 universities.

Agriculture. Approximately 38 per cent of the 1931 working population was engaged in agriculture, compared with 31 per cent in industry and 11.5 per cent in commerce. In 1932 52,924,000 acres, or 39.4 per cent of the total area, was under crops, 27,502,000 acres were meadow and pasture, 6,213,000 acres were devoted to orchards and vineyards, and 25,705,000 acres were wooded. Production of the chief crops in 1934, with 1933 figures in parentheses, was (in thousands of units): Wheat, 338,511 bu. (362,328); rye, 32,984 bu. (35,338); barley, 47,496 bu. (52,594); oats, 302,060 bu. (390,883); corn, 20,073 bu. (17,123); potatoes, 611,887 bu. (544,601); sugar beets, 8790 metric tons (7461); beet sugar (1934-35), 1199 metric tons (945); wine, 2,064,330 gal. (1,367,499); olives (1934-35), 129,522 gal. (58,875); hay, 9935 metric tons (10,554); fodder beets, 30,540 metric tons (29,156); green forage, 10,616 metric tons (11,043). The 1935 wheat crop totaled 7,586,866 metric tons. Livestock in 1934 included 15,704,000 cattle, 7,044,000 swine, 9,571,000 sheep, 3,183,000 horses, mules, and asses, and 1,405,000 goats.

Mining and Metallurgy. Mineral and metallurgical production in 1934, with 1933 statistics in parentheses, was (in 1000 metric tons): Coal, 48,638 (47,041); coke, 3846 (4101); briquets, 5992 (5488); iron ore, 32,304 (30,409); iron pyrites,

155 (168); potash (K₂O content), 379 (326); bauxite, 539 (478); pig iron, 6155 (6324); steel ingots and castings, 6147 (6631); iron and steel (finished products), 4265 (4596). Pig iron production in 1935 was 5,799,000 metric tons; steel, 6,264,000; coal, 46,212,000.

Manufacturing. The output of the leading manufacturing industries in 1934 (with 1933 figures in parentheses) was: Silk (conditioned at Lyon), 2,856,000 lb. (2,625,000); wool (conditioned at Roubaix-Tourcoing), 70,315,000 lb. (94,858,000); wool (conditioned at Mazamet), 31,800,000 lb. excluding September (34,001,000); cotton consumption (year ending Jan. 31, 1935), 489,621,000 lb. (542,315,000); boots and shoes, about 50,000,000 pairs (55,000,000); alcohol, 124,332,000 gal. (111,390,000); vessels launched, 28,000 gross tons (33,000). The general index of industrial production (Base: 1929 equals 100) was 68.6 in 1932, 76.7 in 1933, 71 in 1934, and 67 in 1935.

Foreign Trade. The drastic decline in French foreign trade during the period 1929-35 is shown in the accompanying table.

FRENCH FOREIGN TRADE, 1929-35
[In millions of francs]

Year	Imports for consumption	Exports of French products	% Exports of imports
1929	58,221	50,139	86.1
1930	52,511	42,835	81.6
1931	42,206	30,436	72.1
1932	29,808	19,705	66.1
1933	28,425	18,474	64.9
1934	23,061	17,822	78.1
1935	20,946	15,428	73.6

French foreign trade in 1935 continued to suffer from the handicap of high domestic prices and the severe competition of exports from the countries with depreciated currencies. In 1934 imports declined nearly 20 per cent in value from the 1933 level, while exports were only 3½ per cent less. The French colonies supplied more than 25 per cent of the 1934 imports and purchased 31 per cent of the total exports. Algeria remained France's best customer and the leading source of imports, with Germany taking second place in both categories. The accompanying table shows the distribution of French trade, by leading countries, in 1933 and 1934.

FRENCH TRADE BY COUNTRIES, 1933 AND 1934
[In millions of francs]

Country	Imports		Exports	
	1933	1934	1933	1934
All French Colonies	6,730	5,813	5,989	5,502
Algeria	3,864	2,786	3,310	3,073
Germany	2,928	2,218	1,714	1,979
United Kingdom	1,894	1,637	1,678	1,536
Belgium and Luxembourg ..	1,803	1,470	2,141	1,977
United States	2,935	2,216	868	836
Switzerland	613	523	1,330	1,266

The value of the principal commodities imported for consumption in 1934 was (in 1000 gold dollars): Wines, 74,088; coal, 65,042; wool, 51,972; raw cotton, 40,782; machinery, 39,375; oilseeds, 36,235; fruits and nuts, 32,174; crude petroleum, 30,815. The value of the chief exports of French products was (in 1000 gold dollars): Chemicals and dyes, 45,630; iron bars, blooms and billets, 32,861; cotton fabrics, 31,884; metal manufactures, 30,958; machinery, 30,504; other heavy iron and steel, 29,057; wool, 28,558.

U.S. statistics showed general imports from France in 1935 of \$58,332,861 (\$61,037,255 in

1934) and exports to France of \$116,920,014 (\$115,703,916 in 1934).

Finance. French budget operations for the nine-months period ending Dec. 31, 1932, and for the calendar years 1933, 1934, and 1935 are shown in the accompanying table from the League of Nations *Statistical Year-Book, 1934-35*.

FRENCH BUDGET OPERATIONS
[In millions of francs]

Year	Receipts (excl. loans)	Expenditures	Deficit
1932 * (Apr. 1-Dec. 31) .	35,405.5	41,442.3	6,016.8
1933 *	43,652.2	50,572.1	6,919.9
1934 *	48,281.4	50,162.6	1,881.2
1935 *	46,992.0	47,817.0	825.0

* Closed accounts. * Estimates. * The decrees of July 18, 1935, provided for increases in revenues and reductions in expenditures aggregating 7,063,000,000 francs.

According to preliminary returns, the actual deficit in 1935 was approximately 5,212,000,000 francs on total receipts of 33,504,000,000 francs, compared with an actual deficit of 1,742,000,000 francs on receipts of 35,246,000,000 francs in 1934. The ordinary budget for 1936, as approved Dec. 31, 1935, estimated revenues at 40,450,000,000 francs and expenditures at 40,438,000,000. An extraordinary budget of 6,265,000,000 francs was to be obtained by borrowing.

The public debt of France increased from 298,746,000,000 francs on Sept. 20, 1933, to 311,019,000,000 francs on Aug. 31, 1934. Of the latter sum, 4,011,000,000 francs represented the external debt and 307,008,000,000 francs the internal debt. The internal floating debt was 53,929,000,000 francs. The franc (par value on Apr. 1, 1935, \$0.0663) exchanged at an average of \$0.0393 in 1932, \$0.0503 in 1933, and \$0.0657 in 1934.

Communications. Excluding about 12,000 miles of local lines, France in 1932 had 27,186 miles of railway line in operation, consisting mainly of seven large systems (two under state ownership and five privately owned but operated by the state). During 1932 the railways carried 725,193,000 passengers and 193,000,000 metric tons of freight, the gross receipts being 14,614,000,000 francs. In 1933 and 1934 gross receipts of the seven main systems totaled 11,378,511,447 and 10,836,416,010 francs, respectively. Highways extended 393,740 miles in 1934 (national roads, 49,800 miles). There were 6173 miles of navigable rivers and canals, the traffic on which aggregated 51,009,000 metric tons in 1934. Civil air lines in 1934 carried 46,822 passengers, 483,880 lb. of mail, and 2,961,700 lb. of express freight.

Shipping. The French merchant marine on June 30, 1935, aggregated 3,025,100 gross tons measurement (3,298,100 on June 30, 1934). The French liner *Normandie*, which completed her maiden voyage to New York on June 3, 1935, was the largest ship afloat. She established a transatlantic speed record of 107 hours, 42 minutes. During 1934 27,117 vessels of 52,583 net register tons capacity entered French ports with cargo in the overseas trade, compared with entrances of 27,635 vessels of 53,674,000 tons in 1933.

Government. The Constitution of 1875 vests executive power in the President, acting through a ministry selected by him but responsible to Parliament. Legislative power rests in the Chamber of Deputies and the Senate, the members of which jointly elect the President for seven years. The Senate has an authorized membership of 314 (305 actual members at the beginning of 1935), all 40 years or more of age and chosen by an electoral

college for terms of nine years. The Chamber has an authorized membership of 615 (5 seats were unfilled at the beginning of 1935), elected by direct manhood suffrage for four years. Premier at the beginning of 1935, Pierre-Etienne Flandin (Left Republican), heading a coalition of the Left and Centre parties, with Right support.

HISTORY

France during 1935 was ridden by three ever-present fears—the fear of a general European war in which she would inevitably be involved, the fear of civil warfare between the forces of the Left and Right, and the fear of a financial collapse involving devaluation of the currency and the wiping out of a large share of the national savings. These three fears reacted upon one another in a vicious circle, augmenting the danger presented by each. The increasing severity of the economic and financial depression exacerbated the mutual hostility on economic and political issues of conservatives and liberals, of Fascists and radicals. The threat of civil war and the financial crisis tied the hands of the government and rendered it incapable of decisive leadership in the international field at a time when French security and French prestige were both at the lowest level of the post-war period. Dissension and economic disorganization in France invited attack from without and the danger of another foreign war added to France's economic difficulties and stirred up further hostility between French factions.

The Economic Situation. In place of the economic revival experienced by most of the other great industrial nations during 1935 the grip of the world depression tightened steadily upon France. The index of French industrial production, which averaged 140 in 1930, stood at 93 for 1935. At the end of the latter year only 50 per cent of French workmen were employed full time; the number of registered unemployed on Nov. 30, 1935, was 453,838 compared with 416,605 on Nov. 30, 1934. The value of imports in 1935 declined 2,152,000,000 francs and that of exports fell 2,377,000,000 francs below the 1934 level. While the government's continued deflationary policy had reduced purchasing power, the cost of living had fallen but little. These conditions reflected the paralysis of business which became progressively worse during the course of the year. Few businesses reported profits and only the increasing intervention of the government in a thousand directions to bolster the economic structure prevented more wholesale bankruptcies. The moribund condition of business was evidenced by the steady falling off in tax receipts, despite successive increases in rates. In December, 1935, the tax returns fell 5,212,000,000 francs under the budget estimates. The budget thus continued to run a substantial deficit, in spite of drastic economies imposed during the year. In the five-year period 1930-35 the national debt had increased by 70,000,000,000 francs as a result of successive budget deficits, and the government in 1935 found it increasingly difficult to cover the deficit by borrowing.

The budget issue was the crux of the financial difficulties which twice during 1935 induced a flight from the franc and a substantial drain on the Bank of France's large gold reserve. The inability of successive cabinets to balance the budget, coupled with repeated financial scandals involving highly placed officials, had deeply undermined the confidence of the French people in their govern-

ment and induced widespread fears of a monetary crisis which would force the devaluation of the franc. The drain on the gold reserve of the Bank of France induced by such fears amounted during 1935 to 16,000,000,000 francs, or approximately \$1,500,000,000. The total gold reserves of the Bank stood at 66,296,000,000 francs on Dec. 31, 1935, compared with the total of 82,124,000,000 francs a year earlier. Without a revival of commercial activity, there was little hope of restoring confidence and balancing the budget. The government during 1935 strove desperately to stave off devaluation of the franc in the hope the business revival abroad would spread to France and relieve the economic crisis. Few favorable indications were visible on the economic horizon as the year closed, however, and the pressure for devaluation as a means of starting the wheels of industry and trade was becoming daily more insistent. It is against this economic and financial background that the acts of successive French Cabinets during 1935 must be viewed.

The Flandin Ministry. The Ministry of National Union formed by Pierre-Etienne Flandin on Nov. 9, 1934, represented a coalition of diverse and mutually hostile political groups ranging from the Radical Socialists on the Left to the Republican Centre party on the Right. It was predicated upon a continuation of the political truce established by Premier Doumergue after the Paris riots of February, 1934, had threatened to overthrow the republic (see 1934 YEAR BOOK, pp. 245-247). During the last two months of 1934, Premier Flandin had succeeded in restoring much confidence and arousing hope that the depression would be mastered. But fairly early in 1935 it became evident that he was making no headway and this fact, combined with the hostility towards him among both the Radical Socialists and the parties of the Right, led to his overthrow on May 31.

Early in January M. Flandin explained in a radio broadcast his programme to stimulate economic recovery. He stood for a balanced budget and for maintenance of the existing value of the franc. At the same time he set out to restore a freer economy in which the laws of supply and demand would be allowed to maintain an automatic equilibrium, free from state interference. The gradual reduction of barriers to international trade also was envisaged. As a preliminary step in this direction he undertook, somewhat paradoxically, a policy of rationalization of industry, coupled with an easy-credit policy. He declared that the balancing of production and consumption was necessary before a free market could be re-established. Temporarily, at least, he sidetracked the demands for constitutional and electoral reform which had caused the overthrow of the Doumergue Ministry in 1934.

The laws for regulating the production and marketing of wheat and wine, promulgated Dec. 24, 1934, represented the first step in M. Flandin's economic programme (see 1934 YEAR BOOK, p. 247). Supplementary to these measures, he removed Clément Moret, staunch anti-inflationist governor of the Bank of France, and appointed Jean Tannery to the post on January 2. The Premier hoped in this way to force the Bank of France to rediscount Treasury bills more readily. As a further move towards stimulating industry by providing easy money and credits, he obtained authority to increase the short-term bond issues of the Treasury.

On January 10 M. Flandin continued his offensive against the depression by introducing a bill for the regulation of industry which was similar in many respects to the National Industrial Recovery Act in the United States. Under the measure producers in any branch of industry were authorized to restrict and regulate production, fix wages and hours of labor, etc. If approved by the government and by two-thirds of the concerns, producing at least three-fourths of the entire output of the industry, such regulations might be declared compulsory for the entire industry. To further the general aim of adjusting production to consumption and guaranteeing a profit to the producer and a fair price to the consumer, the government might also extend help to a particular industry in the form of tariff protection, financial subvention, or import quotas. The bill aroused much opposition, particularly among the radical parties, whose spokesmen described it as a measure to reduce the French laborer to a "coolie" standard of living. It was still under discussion when Parliament recessed in April. Meanwhile the critical state of Europe caused the Chamber of Deputies to increase the term of service for conscripts to two years, to approve the construction of the first of two 35,000-ton battleships, to expand the air force, and to appropriate funds to encourage the enlistment of professional soldiers in the army.

These measures served to throw the budget still more out of balance at a time when the threat of a taxpayers' strike by the semi-Fascist Peasants' Front and other factional discords were undermining confidence in the government. Speculative attacks against the gold standard currencies, which followed the devaluation of the belga by the Belgian Government on March 29, shifted from the Swiss franc and the Netherlands guilder to the French franc in May. The decided swing to the Left revealed in the local elections of May 5 and 12 made it more unlikely than before that measures would be taken to balance the budget. The resulting flight from the franc was in full swing when Parliament reconvened on May 28. The same day the Bank of France raised its discount rate to 6 per cent, the highest since 1926.

To meet this crisis, the Flandin Government asked Parliament for unlimited authority to take whatever steps were necessary to restore government finances and promote economic recovery. After a dramatic debate the Chamber of Deputies rejected the request by the decisive vote of 353 to 202, with the Radical Socialist deputies joining forces with those of the Right parties in overturning the ministry. A new cabinet formed by Fernand Bouisson on May 31 made the same request for emergency powers and met the same fate when on June 4 the Chamber decisively rejected the proposal. Fear that the granting of emergency powers would pave the way for dictatorship was apparently a deciding factor in the Chamber's adverse decision.

The Laval Cabinet. Meanwhile the flight from the franc continued, spurring the efforts towards the formation of a new government. On June 7 Pierre Laval succeeded in assembling another coalition, with himself as Premier and Minister of Foreign Affairs and with the all-important Finance portfolio in the hands of Marcel Régnier, the former Minister of Interior. The cabinet lineup represented largely a reshuffling of the preceding two cabinets; M. Flandin, Edouard Herriot, leader of the Radical Socialists, and Louis Marin,

a leader of the conservative Republican Federation, were all included as Ministers of State. M. Laval also made a request for emergency powers, but under conditions which placated both the Left and the Right, and early on June 8 the Chamber approved his request by a vote of 324 to 160. M. Laval promised that he would use his extraordinary powers only to defend the franc and to curb speculation; that he would not make unjust cuts in expenditures and that he would consult with parliamentary committees during the period when Parliament was not in session. The emergency powers were to expire October 31 and all decrees were to be ratified by Parliament before the end of the year. With the formation of the Laval Ministry, the flight from the franc and the drain on the nation's gold reserves were ended for the time being. Parliament adjourned for the summer on June 28, leaving the cabinet several months during which to put its emergency programme into effect.

The drastic nature of the ministry's measures was revealed on July 17 when a series of decrees was issued providing for economies and new revenues aggregating nearly 11,000,000,000 francs. All government salaries and pensions were cut from 3 to 10 per cent and a 10 per cent cut in interest payments was imposed upon all holders of government obligations. At the same time steps were taken to reduce the cost of living. The price of bread and coal was lowered; house and apartment rents below a certain minimum were reduced; and utility rates were slashed. At the same time higher taxes were levied on the larger incomes. The rate on incomes over 80,000 francs was raised 50 per cent, and that on bearer bonds from 17 to 24 per cent. A special levy of 25 per cent was imposed on profits from the manufacture of war materials.

The financial crisis which preceded the formation of the Laval Government had accentuated the danger to the Republic from the various Fascist and royalist groups, the most important of which was the Croix de Feu under Col. François de la Rocque. During June the Croix de Feu displayed great activity. At numerous secret mass meetings of the organization Colonel de la Rocque declared that the hour for a Fascist dictatorship was near. This threat, supported by armed groups throughout the country, aroused the Left elements to action. The Socialist-Communist united front established in 1934 was expanded to include the Left wing of the powerful Radical Socialist party and various other radical organizations. On Bastille Day (July 14) all of the 48 groups participating in the Leftist Popular Front joined in a great demonstration in Paris which gave impressive evidence of their determination to defend democracy and "place French liberties beyond the reach of fascism."

The Popular Front also mobilized the opposition to the Laval Government's economy decrees, which created much discontent among the civil servants and labor unions. When the government applied a 10 per cent wage cut in its naval arsenals and the subsidized French Line put similar reductions into effect, violent protest strikes occurred. During the week of August 10 strikers demonstrating against the government engaged in pitched battles with the police in Brest and Toulon. Six strikers were killed and numerous others injured. Eventually the strike among the French Line employees was settled, but unrest among the workers continued rife.

The violence of the strikers strengthened the government rather than the Popular Front, as there was a public reaction against the latter. Accordingly Premier Laval on August 9 proceeded to extend his rehabilitation programme by issuing another set of economy decrees. They provided for a lower legal limit on interest rates for commercial loans, a reduction of 10 per cent in land leases and in rents paid for business premises, a higher tax on profits earned by directors of business concerns, and an additional levy on profits realized on governmental contracts. The government also established a committee to regulate meat prices and relaxed slightly the restrictions imposed by import quotas upon foreign trade. A public works programme was also developed. The Bank of France was induced to assist the Agricultural Credit Corporation in making low-interest-bearing loans to farmers. By these and numerous similar measures, the government assumed direction over private business and a direct financial interest in it on a scale never before known in France. Premier Laval defended this wholesale state intervention by stating that "the fate of the régime and the life of the country are at stake." In general his programme won the support of the country, but among the more radical elements and among the proponents of currency devaluation his deflationary methods were attacked as wrong in principle and bound to fail.

The economic system showed no very encouraging response to these drastic measures. On the other hand agitation by the mutually hostile Fascists, Peasant Front, and Leftist Popular Front grew more violent. Frequent clashes enlivened the meetings and demonstrations of these rival groups. The growing cleavage between the Right and the Left dominated the Senatorial elections of October 9, which showed a slight swing away from the moderate Radical Socialists towards the more radical Socialists and Communists. Smarting under the loss of eight seats, the Radical Socialist party congress which met in Paris immediately afterwards showed increasing dissatisfaction with the moderate leadership of Edouard Herriot, although he was reelected party leader. The party went on record as favoring laws for the dissolution of the Croix de Feu and other armed Fascist leagues and prepared to form its own military organization if the Fascist groups were not disbanded.

Dependent upon the Radical Socialists for the continuance of his government, Premier Laval on October 23 issued three decrees designed to maintain public order. They imposed a moderate curb on Fascist activities. The Radical Socialists, however, declared them wholly inadequate. On October 31 the government loosed another veritable avalanche of more than 400 decrees, both political and economic in nature. The attempt to stimulate recovery through deflation was extended, while further restrictions were imposed on political agitation. Some of these decrees had a distinctly Fascist tinge, increasing the deep suspicion with which the members of the Popular Front viewed Premier Laval. On November 16 another clash between the Croix de Feu and the Popular Front occurred at Limoges, in which a number of Popular Front members were injured. The threat of bloody civil strife seemed serious when parliament reconvened on November 28.

Premier Laval insured a vote of confidence on his financial policy by reaching a compromise agreement with the Radical Socialists with respect

to his economy decrees. But he seemed unwilling to accede to the Radical Socialist demand for the disarmament and more strict supervision of the Fascist groups. The cabinet seemed in danger of defeat on this issue through withdrawal of Radical Socialist support when on December 6 a spokesman for the Croix de Feu proposed the disarmament of all political groups and the disbandment of semi-military organizations. The proposal was accepted with enthusiasm by the Socialists, Communists, and Radical Socialists and Premier Laval immediately introduced bills providing for the dissolution of private militias, prohibiting the carrying of firearms, and imposing penalties for incitement to assassination in the press. On the strength of these measures the government won a vote of confidence, 351 to 219. But Leftist amendments to the bills were denounced as a betrayal by the Fascist groups and it was December 28 before the measures were finally passed.

Premier Laval was successful also in securing passage of the 1936 budget in record time, but it was only the reluctance of the Radical Socialists to assume power in advance of the May, 1936, elections that prevented his overthrow on the issue of foreign policy. Edouard Herriot resigned the presidency of the Radical Socialist party on December 18 because of the violent attacks upon the cabinet of which he was a member. On December 28 the Premier weathered by the narrow margin of 20 votes a bitter attack from the Left on his effort to straddle the issue raised by Italy's aggression in Ethiopia and to remain on friendly terms with Britain, Italy, and the League alike. Thus the year closed with M. Laval successful in dexterously steering his course through the exceptionally stormy seas of French politics. The budget was balanced, on paper at least—armament expenditures aggregating more than 6,000,000,000 francs had been incorporated in a separate loan budget. Tension between the Left and the Right had been temporarily eased. But business had failed to show any marked improvement. It was certain that the budget issue, the Fascist menace, and the question of foreign policy would soon reappear in an urgent manner and that they would determine the outcome of the quadrennial parliamentary elections due in May, 1936.

Other Domestic Events. On March 14, after 15 months of investigation, indictments were returned against 20 former associates of the swindler Alexandre Stavisky, whose wholesale defrauding of investors in bonds of the Bayonne municipal pawnshop caused the most malodorous scandal in modern French politics (see 1934 YEAR BOOK, p. 245). The trial opened on November 4 and was still under way at the end of the year.

The French Colonial Conference at Paris adjourned on April 13 after sessions lasting four months during which the economic relations between France and the colonies were closely studied and plans laid to promote trade and investment. The conference arranged to establish a permanent colonial bureau in Paris. The maiden voyage of the 79,000-ton *Normandie*, the world's largest liner, stimulated French national pride in the midst of many adversities. The *Normandie* arrived in New York on June 3 after establishing a new transatlantic speed record of 4 days 11 hours and 42 minutes.

Foreign Policy. From 1918 to 1932 France had exercised unquestioned political and military supremacy in Europe. Against her army, reinforced by military alliances with the Little En-

tente (q.v.) and Poland, no other European combination could hope to make progress. But the resurgence of German power beginning with the triumph of Hitler in January, 1933, accompanied by internal strife and growing economic paralysis in France, spelled the end of French primacy. The year 1935 witnessed the culmination of the French decline, and the passing of European leadership to Great Britain.

The inaction and indecision of France in the face of Germany's withdrawal from the League of Nations and the Disarmament Conference in October, 1933, led during 1934 to the partial disintegration of the system of alliances upon which French power was based. Poland reached an understanding with Germany. The Little Entente formed a closer political and economic bloc and began to look to Soviet Russia rather than to France for aid in the struggle which all saw impending. Under Barthou's skillful guidance, the French Foreign Office seized the opportunity presented by Hitler's violent methods at home and in Austria to rebuild and extend its alliances. A working agreement with Britain was again established and the negotiations were begun which led to the settlement of Franco-Italian differences and the conclusion of a military alliance against Germany at Rome on Jan. 7, 1935. For the terms of this agreement, see *ITALY* under *History*.

The Franco-Italian rapprochement apparently completed the encirclement of Germany. But it caused further distrust of French leadership among the Little Entente States, particularly Yugoslavia. And the tacit assent which Foreign Minister Laval apparently gave to Mussolini's request for a free hand in Ethiopia was later to cause irreparable damage to French prestige and security. Temporarily, however, the Reich was ringed by powerful foes, whose unity was welded still further by Chancellor Hitler's announcement on March 16 of the reestablishment of conscription in Germany. This open defiance of the military provisions of the Versailles Treaty provoked notes of protest from Britain, France, and Italy. The French Cabinet on March 20 decided to bring Germany's action before a special session of the League Council and demanded consultation among the League powers to consider appropriate action.

The result of France's initiative and of the unsatisfactory conversations between Sir John Simon, the British Foreign Secretary, and Hitler held in Berlin late in March was the conference of the Prime Ministers and Foreign Ministers of Britain, France, and Italy at Stresa, Italy, on April 11-14. The conference served only as a warning to Germany against further overt action. The united front of the three powers was apparently strengthened and arrangements were made for bringing the French complaint against Germany before the League Council. At the same time Britain and Italy reaffirmed their obligations under the Locarno Treaties, i.e. to preserve by military force if necessary the existing frontier between France, Germany, and Belgium. Britain and Italy gave formal support to the Franco-Soviet project for an Eastern Locarno, guaranteeing the frontiers of Eastern Europe. The conference also approved Mussolini's project for a conference in Rome to settle the political and economic problems of the Danubian States.

In accordance with the Stresa agreements, the French resolution of censure against Germany was passed by the League Council on April 17, with only Denmark abstaining. It provoked an

explosion of wrath in Germany and contributed not at all to French security or prestige. The Reich on April 13 had again reiterated its opposition to an Eastern Locarno and Poland's objections sealed the doom of this carefully nursed project. In place of it M. Laval concluded with the Soviet Union on May 2 a pact of mutual assistance under which the two powers mutually guaranteed their respective territories against aggression by a third power (Germany). Immediately afterwards he visited Warsaw, where he attempted to calm Polish apprehensions aroused by the Franco-Soviet treaty, and Moscow, where M. Laval and M. Litvinov made a fresh attempt to revive the moribund Eastern Locarno idea.

Anglo-German Naval Treaty. With the signing of the Franco-Soviet mutual assistance pact, the encirclement of Germany appeared to be complete and French security seemed temporarily impregnable. But on June 18 the British shattered the Stresa front by suddenly concluding a naval treaty with Germany which authorized Germany to build a navy equivalent to 35 per cent of the British tonnage. This treaty, concluded without consulting either France or Italy, gave Germany the right to build a navy twice the size of that permitted under the Versailles Treaty. It thus placed Britain's signature upon an open violation of the treaty which the British at Stresa had agreed to defend against further infractions. Although the British action provoked furious resentment in France, a semblance of Franco-British collaboration was reestablished during conversations between Anthony Eden, Lord Privy Seal, and M. Laval at Paris on June 21 and 22.

The Ethiopian War. Almost immediately thereafter the development of the Anglo-Italian crisis over Ethiopia and Mussolini's preparations to violate the League Covenant by open aggression against the African kingdom revealed once more the weakness of France's foreign policy. For Britain, Italy, the Soviet Union, Poland, the Little Entente, and the League of Nations were all potential French allies against Germany and France was committed to all of them by a series of treaties which were in certain cases mutually contradictory. Mussolini's African adventure confronted France with the hard choice of either supporting Italy and antagonizing Britain and the League or of supporting Britain and the League and antagonizing Italy. But the British fleet and the Italian army were equally important to France in the event of war with Germany. Moreover Laval could not openly oppose League sanctions against Italy without running the danger of blunting a weapon which the French for years had been perfecting as a means of defense against Germany.

Faced with this dilemma, and harassed by divided opinions at home, M. Laval attempted the difficult task of keeping the good will of all parties to the dispute. He worked unceasingly to prevent an open break between Britain and Italy, meanwhile professing attachment to the League Covenant but opposing efforts to apply the Covenant vigorously against Italy. The strong line taken by Britain, however, gradually forced the French to take a definite stand in support of the League Covenant. Doubtful of France's position the British, after the launching of the Italian invasion of Ethiopia on October 3, demanded from M. Laval an unequivocal statement as to whether Britain could count upon French aid in the event of an Italian attack upon the British fleet in the Medi-

terreanean. France was warned that if she did not support Britain against Italy, she could not count on British aid if Germany violated the Locarno treaty or reoccupied the demilitarized zone of the Rhineland.

On October 18 M. Laval gave the British Government a written pledge of military, air, and naval assistance on condition that Britain would "not take the initiative in any measure against Italy which would not be in conformity with decisions taken or to be taken by the League of Nations in full agreement with France." On the basis of this pledge conversations were held between the French and British staffs during which plans for joint action were elaborated. The French also joined reluctantly in applying League sanctions against Italy, meanwhile continuing their efforts to negotiate a settlement of the Ethiopian problem between Britain and Italy. These efforts culminated in the Hoare-Laval peace plan of December, which offered Italy practically half of Ethiopia and which was swiftly killed by public opinion in Britain and in the smaller League countries as soon as the proposal was made public.

In France M. Laval was severely attacked by the parties of the Left for his Ethiopian policy and defended by the Right, which strenuously opposed an anti-Italian alliance with "British mystics." Paul Reynaud, the Radical Socialist spokesman in the parliamentary debate, declared amid the cheers of the Left that France had to choose "between Italy, which is in rupture with the Covenant, and Britain, the guardian of that Covenant." This choice still confronted France as the year ended. Meanwhile M. Laval's vacillations and his complacent attitude towards Mussolini's policy had completed the destruction of French prestige among the League powers, particularly among the small States who looked to the League Covenant as their main bulwark against aggression by the strong. These powers had rallied to Great Britain, which, in the words of an eminent American authority on international affairs "had snatched from feeble and fumbling French hands the leadership of Europe."

See ETHIOPIA, GERMANY, GREAT BRITAIN, ITALY, POLAND, and UNION OF SOVIET SOCIALIST REPUBLICS under *History*; also LEAGUE OF NATIONS, LITTLE ENTENTE.

FRANQUI, ÉMILE. A Belgian statesman, died at Overysche, near Brussels, Nov. 16, 1935, where he was born in 1863. After attending a military academy, he entered the army in 1877, and in 1881 went to the Congo as a subaltern. By 1885 he attained the Commissionship of the Cataracts District. A member of the Bia Expedition from 1891 to 1892, on the death of Bia, he assumed the leadership, and by his able command won large tracts of territory containing great copper deposits. In 1896 he was sent to China, first as consul at Hangkow, and later as consul-general at Shanghai, in reward for his services to his country. Forseeing the advantages of private capital in China, he left the consular service and established La Compagnie Internationale d'Orient, which was the foundation of his large fortune in valuable coal and railway concessions in North China.

In 1905, M. Francqui was introduced to a banking career by his partner in the Chinese enterprise, M. Jadot, and he became associated with the Banque d'Outremer in Brussels, subsequently becoming its president. During the German occupation of Belgium he was president of the Comité

National. After the War he instituted, at the request of King Albert, the National Scientific Fund, and from that time on served his government in varied capacities. He came to the United States in 1920 to arrange a loan extension, and again in 1934, as a member of the committee that announced the accession of Leopold III to the throne.

He was a member of the Dawes Commission in 1924, and in 1926 received his first cabinet appointment as minister without portfolio in the Jaspar government. Through his knowledge and capabilities, the value of the franc was stabilized against almost hopeless odds, and the *belga* was devised. In 1934 he was invited to join the Theunis ministry as minister without portfolio, and in order to do so resigned all his banking connections, including that of representative of the National Bank of Belgium on the board of the Bank for International Settlements. He was not to be a mere figurehead in the cabinet, but was given the important task of holding the gold bloc together while pressing Great Britain and the United States to come to some sort of an understanding in the currency war.

As a member of the Board of the Bank for International Settlements, he devised a plan for the establishment of an international rediscount bank to finance exports as a means of checking the depression, but it did not materialize. During the post-War years he attended the major financial conferences, and his profound knowledge of inflation and deflation, as well as his great skill in the understanding of currency matters, made a great impression on the representatives of other governments, and made him the leader of the gold bloc.

M. Francqui was regent of the National Bank of Belgium, chairman of the Lloyd Royal Belge, and managing director of Union Minière du Haut Katanga, and in 1931 became governor of the Société Générale de Belgique. He also established the Francqui Foundation, which makes large grants to Belgian scientific research each year.

FRAZIER-LEMKE FARM MORTGAGE ACT. See UNITED STATES under *Congress*.

FREE CHURCH FELLOWSHIP, THE. A cooperative movement of liberal churches and individuals, first organized in 1933 under the name of the Free Church of America. The name was changed to the Free Church Fellowship as more accurately describing an enterprise which is not a new denomination or an organic merger of existing denominations but a liberal federation of churches and individuals. The American Unitarian Association and the Universalist General Convention are the only denominational members of the Fellowship, but individual Methodist, Community, Federated, and Independent churches belong, and individuals from other denominations are included in the Council and the Roll of Fellows. Rev. Louis C. Cornish, D.D. of Cambridge, Massachusetts, the President of the American Unitarian Association, was the first President of the Free Church Fellowship. He has been succeeded by Rev. Frederick B. Fisher, D.D. of the Central Methodist Church in Detroit, Michigan, former Methodist Bishop of Calcutta, India. The Secretary is Rev. Charles R. Joy, D.D. who is administrative Vice-president of the American Unitarian Association. The headquarters of the Free Church Fellowship are at 16 and 25 Beacon Street, Boston, Massachusetts.

The principles of the Free Church Fellowship are stated as follows: *One*, we believe that Re-

ligion is ethical, that ethics is social, and that the church is the organized conscience of society. *Two*, we conceive our task to be: First, the cultivation of excellence, the promotion of character, the encouragement of the individual in his endeavor to realize through all his relationships, the principles of integrity and honor; and second, the uniting of individuals and churches for the upbuilding of human welfare. *Three*, we propose that the Free Church Fellowship shall be a union of religious liberals, a home for the emancipated spirit of man, whatever the forms of religious faith and worship.

By virtue of denominational membership, all Unitarian and all Universalist churches become members of the Fellowship by their own vote. All other churches become members by the vote of the Council of the Fellowship. Individuals become members by the vote of the Council or the Executive Committee.

FREEMASONRY. Anniversaries. Australasia. The centenary of Tasmania's Operative Lodge No. 1, as well as of the entire craft in that State, was observed at Hobart on February 25-28. But Masonic history in the antipodes dates back a full generation earlier, when "several officers of H.B.M.'s ships, together with some respectable inhabitants of Sydney" (N.S.W.) held a Masonic meeting despite the colonial governor's ban; and, in consequence, one of their number was banished. "The Lodge of Social Military Virtues, No. 227" attached to the 46th Regiment, worked under a warrant from the Grand Lodge of Ireland and appears to have been the earliest in Australasia.

Belgium. Le Grand Orient de Belgique, though actually founded in 1833, began the celebration of its first centenary on May 5 with a musical *soirée* conducted by about 30 musicians who are Masons. On May 6 the opera, *Merchant of Venice*, to which female relatives of Masons were invited, was staged in the Monnaie Theatre, Brussels, converted into a lodge room for the occasion. On Sunday, May 7, at a regular communication, a pageant was presented, illustrating the activities of Belgian Masons for education and world peace.

England. Old Union Lodge No. 46 of London has just completed 200 years of continuous existence, thereby earning the coveted privilege, enjoyed by but four other English lodges, of prefixing "CC" to its name.

Sweden. The bicentenary of Swedish Masonry was observed on various occasions during the year, beginning with January 28, the festival day of Stockholm Craft Lodge, when representatives were present from other Scandinavian Grand Lodges as well as from those of the British Isles and Netherlands.

Turkey. The silver jubilee of the Grand Orient was celebrated on Aug. 1, 1934, its establishment following about one week the Turkish revolution of July 24, 1909. Over 300 members attended the celebration at which Grand Master Mouhiddin Osman presided.

United States: California. On March 23, Cyrus E. Hull of Los Angeles (b. Oct. 28, 1830) celebrated his 82d continuous year as a Master Mason, having been "raised" in Hampden Lodge, Springfield, Mass. in 1853. This nearly reaches the record of longevity among Masons.

Illinois. On May 13, Bodley Lodge, No. 1 at Quincy celebrated its centenary, having been chartered by the Kentucky Grand Lodge in 1835, and being now the oldest continuously existing lodge in Illinois. Others which had been organized previ-

ously succumbed to the Anti-Masonic crusade of the 1820's.

Ohio. William E. Thompson, life member of Bethel Lodge, No. 61, celebrated his 100th birthday in June.

Oregon. Williamette Lodge, No. 2 observed its 85th anniversary on June 24, in the Portland Masonic Temple. Its first meeting was held in the upper story of a warehouse and it was one of the three constituent bodies forming the Oregon Grand Lodge in 1851.

Texas. The centenary of the Texas craft was commemorated on March 16 at Brazoria, where, just 100 years earlier, six Masons gathered under the "Masonic Charter Oak of Texas" to organize its first lodge. The present Grand Master of Texas Masons delivered the principal address, which was a prelude to the statewide centennial of 1936.

Washington. St. John's Lodge, No. 9, Seattle, observed its Diamond Jubilee on September 4, with an historical play, "Our Pioneer Founders," and the presentation to three of its veterans of half-century membership certificates.

Anti-Masonic Crusade. "The persecution of Freemasons in continental Europe within the past decade, appears to be spreading," notes the *New Age*, expressing what thoughtful observers of the craft have sensed for some time. It is no longer, as in Gambetta's day, merely *clericalisme, voila est l'ennemi*; now there is Fascism, Nazism, Bolshevism and every other form of autocracy, which sees in Masonry its natural foe. The International Masonic Association, at its 1934 convention in Luxembourg, called attention to current attacks on the craft and planned "interior and exterior defense" and the International Conference of Supreme Councils at Brussels, in June, rejected "the unjustifiable and unwarranted attacks against Freemasonry and Freemasons, in many lands, as unworthy of serious consideration by intelligent people."

Austria. It is reported that Masons are not considered eligible to posts under the present government and that Masonic meetings are not permitted except under police surveillance.

France. The attempt to involve Masons in the Stavisky scandal continues and a movement has been launched for an "Anti-Masonic Union," with the "Interparliamentary Groups for Action against Masonic Activities" as a directing committee. The latter, on July 5, issued a manifesto, declaring: "Freemasonry must be struck down; a struggle to the death has been commenced against it; and the national forces must now fight without truce or respite."

Germany. On May 28, the Ministry of the Interior announced the "voluntary dissolution" of 14 Masonic lodges, pursuant to the Goering decree of Jan. 8, 1934; and on August 8 all such lodges in the Reich were declared dissolved. The confiscated property of the "Three Globes" Lodge, largest in Germany, was returned to its trustees; but on November 9 the confiscation was announced of the property of eight Jewish lodges, under the anti-Communist law. In mid-September, Dr. Hjalmar Schacht, Minister of Economics and a former Freemason, refused to permit an inquiry into the Masonic antecedents of his subordinates. Curiously enough, while thus destroying the German Masonic craft, the Nazi leaders have taken a leaf out of its experience and are attempting to regiment all German skilled labor, into "craftsmanship chambers," each with the three grades of apprentice, journeyman, and master, virtually those of ancient craft Masonry, at the same time requiring, as did the

latter, that crafts may be conducted only by certified masters whose work is irreproachable. Meanwhile, some German Masons are attempting to carry on by organizing in Palestine "The Symbolic Grand Lodge of Germany in Exile," making a special effort to meet the needs of exiled German Masons there. It is composed of two lodges in Jerusalem (one working in Hebrew), a third in Tel Aviv and another, working in Hungarian and previously under the Grand Lodge of Hungary.

Ireland. During the riots following the "Orange Day" disturbances in Northern Ireland, a Masonic Hall was destroyed in the Free State.

Netherlands. The Grand Master of Masons formally demanded the criminal prosecution of the periodical, *De Residentiede*, for publishing an article on "Masonry in the Baltic States," which charged, *inter alia*, that "the mysterious crimes of recent years plainly show what immense influence Freemasonry exercises over the world."

Portugal. The national assembly voted unanimously to require all government and corporate officers to disclose and surrender membership in any secret society, under penalty of losing their positions. As a consequence, Masonic activities in Portugal have been officially suspended and foreign correspondents are requested to avoid all references to the order and to send no Masonic publications into the country.

Spain. The International Masonic Association's *Bulletin* states that "of the 3000 prisoners captured by the regular troops (in the recent revolution) not more than a dozen were Masons." The commander of the government forces in Asturias, where much severe fighting occurred, was an active Mason and many of the craft fought against the Catalan revolutionists. But, continues the *Bulletin*, "The reactionary press persists in its campaign of slander, clamoring for the suppression of the lodges. Not satisfied with saddling our institution with blame for the insurrection, it now denounces us as responsible for King Alexander's death, though he himself was an active Mason."

Meanwhile, the Spanish Supreme Council, through its *Bulletin Oficial*, admonishes its adherents "to permit no discussion of any subject in the temples which relates, directly or indirectly, to party politics."

Switzerland. Maj. Ernst Leonhardt, "Der Führer" of Swiss Nazis, was convicted in the Basel Criminal Court and fined (with alternative imprisonment) for libeling Freemasonry. As evidence of its "criminal activity," he declared in his defence that "Masons founded the League of Nations." Initiative petitions for a law to suppress Masonry (1934 YEAR BOOK, p. 618) purported to contain 56,946 signatures, but an investigation showed that 15 per cent or more were fraudulent, having been obtained by paid solicitors who received the equivalent of from 6 to 12 cents for each signature. The Federal Council, to which the matter was referred, ordered all petitions returned to their respective communities for verification.

Turkey. Following announcement in the London *Freemasons' Chronicle* that the government contemplated suppressing all societies whose headquarters are located abroad, a decree was issued on October 12, abolishing Freemasonry in Turkey.

Intercraft Relations. With a movement of such widespread proportions menacing the very existence of Masonry, it would seem to be a poor time for internal dissensions among the craft itself, especially over trivial questions of alleged etiquette, such as the controversy (1934 YEAR BOOK, p. 250)

initiated by the Massachusetts Grand Lodge over Philippine lodges in China, has now come to be regarded; for no one pretends that any Masonic right or law was infringed by the latter. Fortunately, however, the former has received practically no support, outside of its own jurisdiction, from American Masonry. The latter's native sense of fair play has led inevitably to but one conclusion wherever the facts have become fully known. A typical attitude was that of the Mother Supreme Council of the Scottish Rite whose Grand Commander, in his allocution, delivered before that body at its biennial session in Washington on October 21, noted that "no other Grand Lodge in the United States had severed its relations with the Philippine Grand Lodge," and added:

The Grand Lodge of Scotland notified the members of La Perla del Oriente lodge (which continues in the Philippines despite the fact that they are not "open territory") that they were barred from visiting any lodges under the Philippine Grand Lodge, which thereupon issued a notice that it would be glad to welcome all visitors from lodges which had suspended relations of amity with it. This calls to mind the lines of Brother Edwin Markham:

"He drew a circle that shut me out
Heretic, rebel, a thing to flout.

But Love and I had the wit to win
We drew a circle that took him in."

I instructed our Deputies in both the Philippines and China that we deplored very much the situation, but, as far as the Scottish Rite was concerned, it would accept petitions . . . from members of the lodges under any of those jurisdictions

The attitude of other American grand bodies has been expressed by their representatives as follows:

District of Columbia. The Grand Lodge reviewer finds "the correspondence covering the situation exceedingly interesting and indicates that the Philippine Grand Lodge was acting entirely within its rights."

Georgia. The Grand Master, proceeding upon information later conceded to be inadequate, issued a decree on June 1, 1934, suspending fraternal relations with the Philippine Grand Lodge; but in October, following, the decree was rescinded and that action was approved by the Georgia Grand Lodge.

Minnesota. To the "foreign correspondent" the Philippine "Grand Master's report . . . seems to indicate that the Philippine Grand Lodge is Masonically right in its action as to entering China for the purpose of constituting lodges."

Texas. "Certainly our Philippine brethren were well within their legal rights in the matter of establishing lodges in the open or free territory of China and, for aught we know, acted wisely and judiciously," is the reviewer's conclusion.

Utah. The Grand Secretary, after a full review of the situation, sees in the action taken by the Massachusetts Grand Lodge, "a suggestion of coercion of the weaker by the stronger."

Virginia. To the Grand Secretary, "the conclusion to be drawn from the anxiety of the four oldest Grand Lodges, would seem to be that, with the only Grand Lodge in Asia taking the same course they have taken, (it) may in a few years bring about the formation of the Grand Lodge of China" and thus end further extension there by other Grand Lodges.

Wyoming. The Grand Secretary, who submitted the report on fraternal correspondence, could "not see any reason for the action taken, as . . . in Shanghai there are Masonic lodges working under six different grand jurisdictions."

In South Australia, where there are 154 lodges with 13,842 members, the Committee of Jurisprudence said

the action of the (Philippine) Grand Master, in every particular, was in accordance with Masonic law, custom and usage and . . . that the action of (the four oldest) Grand Lodges, in suspending relations with that of the Philippines, was the result of misinformation, etc.

Finally, from China itself comes an admission that all is not well with subordinate bodies of "the four oldest Grand Lodges." The Scottish District Grand Master writes to his Grand Lodge at Edinburgh:

We are all awaiting with great eagerness further developments in the matter. The cleavage is painful and deeply regretted.

Meanwhile, on March 9, the Philippine Grand Master, undaunted by the action of "the four oldest," granted a dispensation to 14 (mostly American and Canadian) Masons to form Szechuen Lodge at Chengtu, capital of China's westernmost province. Only one who knows the isolation of these foreign residents, over a month's journey from the coast, will understand how much it means to them to have in their midst a regular branch of a world-wide fraternity. That much, at least, the Philippine Grand Lodge has already accomplished. On October 26, the Philippine Grand Master (an American), after an official visit to China, granted a dispensation for West Lake Lodge at Hangchow in response to a petition signed by 28 Masons, many of whom were Americans. Thus the Philippine Grand Lodge had five subordinate bodies in China.

FRENCH ART. See ART EXHIBITIONS.

FRENCH CAMEROON. See CAMEROON, FRENCH.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA. A French colonial empire, comprising the colonies of Chad (398,955 sq. m.; pop. 1,095,717), Gabun (104,320 sq. m.; pop., 388,635), Middle Congo (172,411 sq. m.; pop., 662,713), Ubangi-Shari (236,363 sq. m.; pop., 1,176,564). Total area, 912,049 sq. miles; total population (1934), 3,323,629 (including 4661 Europeans) compared with 3,192,282 (1931 census). Chief towns: Brazzaville, the capital, 4000 inhabitants; Fort Lamy, 6000; Libreville, 4500; Bangui, 13,500; Port Gentil; Pointe-Noire.

Production and Trade. Wild rubber, coffee, cacao, cotton, palm oil, and ivory were the main products. Copper, zinc, and lead exist. Large numbers of cattle, sheep, asses, camels, horses, and ostriches were raised in the Chad colony. In 1933, imports were valued at 177,757,132 francs; exports, 141,005,775 francs (franc averaged \$0.0501 for 1933).

Government. The general budget for 1934 was balanced at 98,443,000 francs. Local budgets (in 1000 francs) of the colonies were balanced as follows: Chad, 16,342; Gabun, 19,200; Middle Congo, 21,161; Ubangi-Shari, 15,600 (franc averaged \$0.0657 for 1934). French Equatorial Africa, by a decree of June 30, 1934, was consolidated into one administrative unit under a governor-general assisted by an administrative council and a secretary-general. Governor-General, M. Silvestre who was appointed during 1935 to succeed Edouard Renard, killed in an aeroplane accident near Bologo, Belgian Congo, in March, 1935.

FRENCH GUIANA (gē-a'na) AND IN-INI. A French colony in South America. Area, 34,740 sq. miles; population (1931 census), 22,169. Cayenne, the capital, had 10,744 inhabitants in 1931; the other 14 communes had a total of 11,425 persons exclusive of the penal settlement of Maroni, the floating population of miners without fixed residence, and officials, troops, and native tribes. The chief ports were Cayenne, St. Laurent-du-Maroni, and Oyapoc.

Production and Trade. Rice, maize, manioc, cacao, coffee, and sugar cane were the main crops. The forests were rich in timber and commercial gums. Gold mining (placer) was the main industry. In 1933, imports were valued at 36,946,042 francs; exports, 24,274,703 francs (franc averaged \$0.0501 for 1933).

Government. The budget for 1932 was bal-

anced at 16,578,950 francs. A governor administers the colony aided by a privy council, and a council-general elected by the French residents of the colony. During 1933 French Guiana was divided into two independent divisions—the coastal division remained French Guiana and the interior was named Territory of Inini. Governor, M. L. J. Bouge.

FRENCH GUINEA. See FRENCH WEST AFRICA.

FRENCH INDIA. The colonies of France in India, consisting of Chandernagor, Karikal, Mahé, Pondichéry, and Yanaon. Total area, 198 sq. miles; population (1933), 281,684. Pondichéry (capital), had 46,535 inhabitants (1933). In 1932 the 62 primary schools and 5 colleges, all supported by the government, had 12,099 students.

Production and Trade. Groundnuts, manioc, and rice were the main crops. Livestock in the colonies (Jan. 1, 1934): 66,710 cattle, 27,225 sheep, and 33,745 goats. In 1933, at the ports of Pondichéry and Karikal, imports were valued at 108,615,000 francs; exports, 127,418,000 francs (franc averaged \$0.0501 for 1933).

Government. The local budget for 1933 showed revenue of Rs3,049,585 and expenditure of Rs2,763,199 (rupee averaged \$0.2489 gold for 1933). The colonies were administered by a governor (nominated by the President of France) aided by an executive council of 5 members and an elective general council of 28 members. French India was represented in the French Parliament by 1 senator and 1 deputy.

FRENCH INDO-CHINA. A French dependency comprising the divisions shown in the accompanying table.

<i>Division</i>	<i>Sq. m.</i>	<i>Pop. (1931)</i>	<i>Capital</i>
Annam *	56,974	5,122,000	Huế
Cambodia *	69,866	2,806,000	Pnom-Penh
Cochin China *	25,274	4,484,000	Saigon
Kwangchow *	328	200,000	Fort Bayard
Laos *	89,320	944,000	Vientiane
Tongking *	44,660	8,096,000	Hanoi
French Indo-China ..	286,422	21,652,000	Hanoi ^d

* Protectorate. * Colony. * Leased from China in 1899 and placed under the authority of the Governor-General of French Indo-China. ^d The capital city was Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices remove to Saigon.

Chief towns with 1931 populations in parentheses: Cholon (134,000), Hanoi, the capital (124,000), Huế (123,000), Saigon (122,000), Pnom-Penh (96,000), Binh-Dinh (74,000), Battambang (22,000), Vientiane (10,000), Fort Bayard (9000). In 1933 there were (for native children) 8314 elementary schools with 390,000 pupils, 23 high schools with 4209 pupils.

Production and Trade. Rice (3,042,633 metric tons for 1934-35), rubber (20,719 metric tons exported in 1934), pepper (2800 metric tons in 1935), maize (250,000 metric tons in 1935), coal (1,592,000 metric tons in 1934), tin, zinc, fish, tea, and hides were the main products. In 1934, imports were valued at 909,181,000 francs, the main items were cotton and silk tissues, machinery, kerosene, and mineral products; exports, 1,044,106,000 francs (franc averaged \$0.0657 for 1934). France supplied 60 per cent of the imports.

Communications. There were 2982 kilometers of railway line in operation during 1935. A new railway to link up the northern system with the southern system was under construction during 1935. In Saigon an automatic telephone exchange, with a capacity of 2000 subscribers in Saigon and

1000 in Cholon, was placed in service late in 1935.

Finance. The general budget of French Indo-China for 1935 calls for ordinary expenditure of 559,162,100 francs chargeable to current revenue and 210,496,810 francs public works against loan funds. For 1934, revenue and expenditure in the general budget were balanced at 609,540,000 francs. The public debt amounted to 2,003,400,000 francs on July 1, 1935 (franc averaged \$0.0661 for June, 1935). The local budgets were balanced as follows (in 1000 francs): Annam (1934), 88,082; Cambodia (1933), 79,420; Cochin China (1933), 132,291; Kwangchow (1934), 4648; Laos (1934), 34,045; Tongking (1934), 111,150.

Government. French Indo-China was administered by a governor-general aided by a secretary-general, a government council, and a grand council for economic affairs. Each of the protectorates was headed by a French resident-superior and Cochin China (a colony) was under a governor. Governor-General in 1935, René Robin.

History. On July 22, 1935 the commercial agreement of May 16, 1930, and the supplementary agreement of May 4, 1935, governing trade between China and French Indo-China, were made effective by China and France.

Discontent was caused among civil servants by the decrees issued during June, July, and August of 1935 which reduced the salaries of all government employees by 10 per cent and discontinued allowances on exchange fluctuations.

FRENCH IVORY COAST. See FRENCH WEST AFRICA.

FRENCH LITERATURE. The year was marked by two outstanding commemorations: The French Academy celebrated the 300th anniversary of its foundation by Richelieu with elaborate ceremonies, a remarkable exhibit in the Bibliothèque Nationale, and a volume of over 500 pages, *Trois siècles de l'Académie Française*, par les Quarante (Didot); moreover the Academicians succeeded in completing the 8th edition of their famous *Dictionnaire*.

In Paris, in the provinces, in every locality where he had spent even a few days, Victor Hugo, who died fifty years ago, was remembered. But there were other literary celebrations: In Provence, near Arles, at Fontvieille, festivities signaled the inauguration of a museum in the *Moulin* of Daudet. In connection with the "Fêtes de Paris," a very elaborate representation of Greban and Michel's celebrated *Mystère de la Passion* (1452) was given in June on the large "parvis" of Notre Dame. The death of Henri Barbusse (q.v.), who died in Moscow from croupous pneumonia, and who had been the fiery advocate of the cause in France was an occasion seized by the Soviet Government to make a great demonstration. The death of Alfred Vallette, the founder and editor of the *Mercur* de France, and the stepping of Duhamel, almost on the same day, into the editorial room of the famous review, and in the French Academy were among the outstanding events of the year and these were followed by the announcement that the Frères Tharaud (Jérôme and Jean) were to dissolve their literary partnership.

During 1935 the French Academy refused to elect Paul Claudel. (For an account of the elections see the article ACADEMY, FRENCH.) The members who died during the year were G. Lenôtre, Jules Cambon, and Paul Bourget. Among others deceased there may be named Dr. Armaingaud, Antoine Thomas, Panaït Istrati, and René Crevel (suicide). Madame Colette was elected to

replace the Comtesse de Noailles in the Académie Belge de Langue et de Littérature. Early in June there was held in Paris a Congrès International d'Écrivains that lasted five days during which were heard such men as Barbusse, Gide, Mann, Benda, whose chief topic of discussion was whether or not Communist writers still belonged to literature.

The chief literary prizes of the year were awarded as follows: Grand Prix de Littérature (French Academy) to André (not George) Suarès—a few days before the same Suarès had received the Prix de la Société des Gens de Lettres; Grand Prix du roman (Academy), Albert Touchard, for *La Guêpe*; Prix Goncourt, Joseph Peyre for *Sang et Lumière*; Prix Femina, Claude Clive, for *Bénédiction*; Prix Paul Flat, Bernard Narbonne, for *A la Gasconne*; Prix Populiste, Henri Troyat, for *Faux Jour*; Prix de la Renaissance, Fernand Fleuret, for *Au Temps du Bien-Aimé*; Prix Gringoire, Marcel Griaule, for *Les Flambeurs d'hommes*; Prix Renaudot, François de Roux, for *Jours sans gloire*; Prix de la Critique, Thierry-Maulnier, for *Racine*; Prix de Littérature Coloniale, Oswald Duran, for *Terre Noire*. See also under Poetry and Theatre, below.

Literary History. Scholars were so prolific in production during the year 1935 that it is indeed difficult to select from a mass production of so high a standing. Medieval: The publication by Droz of the *Recueil de Freppel* (short plays mostly unknown); Ernest Hoepfner, *Les Lois de Marie de France*, and the transliteration into modern French, by Professor Cohen, of Adam le Bossu's *Jeu de Robin et de Marion*. Of work associated with or relating to the 16th century may be cited: G. Atkinson's *Nouveaux Horizons de la Renaissance*; Pierre Villey, *Montaigne devant la Postérité*; Plattard, *État présent des Etudes sur Montaigne*; Imbart de la Tour, *Calvin, l'Institution chrétienne*, and the very erudite edition of Calvin's *Institution* by Jean Panier (1935 marking the 4th centenary of that epoch-making work). Of work that concerned the 17th century, Mabile de Poncheville's *Valentin Conrart, le Père de l'Académie* (in connection with the tercentenary of the French Academy) and the not very revealing *Vie secrète de l'Académie*, by Peter must be noted. Racine inspired two books: Thierry Maulnier, *Racine* (which was awarded the Grand Prix de la Critique), and J. Lichtenstein, *Racine, poète biblique*. The Abbé Langlois published a voluminous *Correspondence de Mme. de Maintenon* (who is said to have written about 60,000 letters); Mlle. F. L. Wickelgren gave us *La Mothe Le Vayer, sa vie, ses œuvres*, and Paul Hazard, a capital work in *La Crise de la Conscience Européenne* (3 vols.)—crisis placed in the years 1680-1715, still during the reign of Louis XIV. Of the 18th century: H. Bordeaux wrote the life of the famous *Mariana, la Religieuse Portugaise*; André Maurois, published a *Voltaire* embracing a large subject in a comparatively very small book; the ninth volume of the posthumous Faguet, *Histoire de la poésie Française* came out, covering the late part of the century; G. Chinard, gave a very interesting edition of Diderot's *Supplément au Voyage de Bougainville*, while M. Torrey contributed a thorough study of the relations between "Diderot and Voltaire" (in *Publications of the Modern Language Association*; December, 1935, New York).

Concerning the 19th century the output of scholarly works was large: Albert Cahuet, *Lucile de Chateaubriand, un Werther féminin*; G. Rudler, *Adolphe* (Coll. Grands événements litt.) discusses

the Staëliens and the Lindsayens, i.e. whether the woman in the book is Mme. de Staël or Mme. Lindsay; two books on *Stendhal*, one by Alain, one more documentary by P. Jourda, *Stendhal, l'Homme, l'œuvre*; Balzac's, *Correspondance avec Mme. Zulma* (edited by Bouteron); G. Ascoli, *Réponse à quelques détracteurs de V. Hugo* (opening address of his lectures at the Sorbonne); G. Brunet, *Victor Hugo* (in the excellent collection, *Maîtres de la litt.*); P. Berret, *La Légende des Siècles* (Coll. "Chefs d'Œuvres"); J. Hamelin, *V. Hugo avocat*; H. G. Hunt, *Le Socialisme et le Romanisme, La Presse de 1830-1848*; V. Giraud, *Vie secrète de Sainte-Beuve*; and the publication of the most important *Correspondance de Sainte-Beuve* by Bonnerot; Jean Davray, *George Sand et ses amants*; Gérard-Bailly, *Les Véhémences de Louise Collet*; Abbé Grillet, *Le Diable dans la littérature au 19^{me} siècle*; J. Pommier, *La mystique de Baudelaire* (very well documented); Mme. Paul Verlaine, *Mémoires de ma vie*; Camille Mauclair, *Mallarmé chez lui*; Helen Trudjean, *Esthétique de Huysmans* (heavily loaded with documents); St. Fumet, *La Mission de Léon Bloy*; G. Ferrière, *Jehan Rictus, son Œuvre*; Raymond Lefevre, *La Vie inquiète de Loti* (Malfère); Proust's *Correspondance*, vol. 5; J. Cusenier, *Jules Romains et l'Unanimité*; Ch. Braibant, *Du Boulangisme au Panama, Le Secret d'A. France*; H. Dérioux, *La Poésie française contemporaine, 1885-1935*; Jean de Latour, *Examen de Valéry* (said to have satisfied Valéry); Octave Aubert, *Louis Barthou*.

Two more volumes have appeared of Brunot's magnificent *Histoire de la Langue Française*, both concerning the 18th century: *L'Universalité en Europe* and *Le Français hors de France*. Much praise has been given also to G. and R. Lebidois, *Syntaxe du Français moderne* (2 vols. Picard).

Novels. During the year 1935 the novel was produced abundantly. Mauriac in *La Fin de la Nuit* takes up again the lamentable story of Thérèse Desqueyrou; after a series of intrigues, even directed against her own daughter from whom she tries to wrest a lover, she finally sees the light . . . in religion. Not more cheerful are the two new volumes of Jacques de Lacretelle's *Les Hauts Ponts*, the story of a woman who determines to buy back the family estate at any cost; she succeeds and turns it over to her son; but he proves unworthy of the trust, so that finally the whole life of the woman has been wasted, all the money obtained, gotten mostly by intrigues, has been to her "monnaie de plomb" (vol. iii, *Années d'Espérances*, iv. *Monnaie de Plomb*). Duhamel gives vol. iv of his *Chronique des Paquiers*: "La Nuit de Saint Jean." Behaine reaches the tenth volume of his *Histoire d'une Société*: "Les Signes du Ciel." Jules Romains continued to command interest with two more volumes of his *Hommes de Bonne Volonté*: ix, "Montée des périls," x, "Les Pouvoirs" (War is imminent, and J. R. suggests what might have been done previous to 1914, while telling what actually did take place).

Among the authors whose fame is well established, who have contributed novels, may be mentioned: Henri de Régnier, *Moi, elle et lui*; E. Jauloux, *Le dernier jour de la Création* (as artists imagine those last days and as they try to express them in their art); Henri Deberly, *La maison des trois veuves* (they have a nephew who drives them to despair); G. Bernanos, *Un Crime* (very exciting and extraordinary story of a woman who commits a crime and for a while succeeds in having herself taken for a priest); Jean Fayard, *La Chasse aux Rêves* (a young man from the lower stratum

of society comes near ascending socially; fails, and then revolts); and the original Jean Giono, *Que ma joie demeure* (in which a poet tries to offer happiness to the village and finally has to go away with his hopes dispelled).

Problem novels were numerous: J. H. Rosny, *Marcelle éblouie* (love of girls for older men); Henri Troyat's *Faux Jour* caused much discussion (the disillusionment of a boy for his father); Marcel Prévost had one of his keen psychological studies in *Clarisse et sa fille*, a mother who acts as if she were jealous of her own daughter, but (like in *Ebronie*, 1934) the analysis is so subtle that one hardly knows what the author himself thinks of the case); Pierre Valdagne, in *Mélanie Cocherot* followed the case of a fine girl who, by mere inertia, and having the occasion to do so, generally lets herself become the slave of an easy, lazy, and none too honest life. The relation of parents and children in modern surroundings were studied in Robert de Traz's *Le Pouvoir des Faibles*. E. Bove in *Le Pressentiment* told the story of a man who suddenly acts strangely, leaves his family and friends; but was prompted by an indistinct feeling of sudden death that threatened him. Bertrand de la Salle puzzled the public when, in his *La Pierre philosophale*, he treated a group of three young men who, following the war, sought anchor for their destinies and found nothing but doubt and fear.

Opposed to an attitude of mere expectation is that of several authors who shared the conviction that the world is on the eve of revolution, although attempts at actual revolt are doomed for the present by the powers that are: André Malraux, whose descriptions of communistic upheavals in China are so well known, turned his attention to Hitler in Germany in *Le Temps du Mépris* (shocking story of might, yet of brutal force); Paul Nizan in his *Le Cheval de Troie*, shows how a professor in a Lycée of the south of France smuggled revolutionary ideas into the locality, just as the Greeks smuggled warriors into Troy. Ramon Fernandez, another author of rather recent fame, in *Les Violents*, shows a woman who favors the communistic workers employed by her husband.

Here one may refer to a rather long and dreary list of novels by very able writers, all of whom sounded a pessimistic note; indeed, from such a source one can but draw dark conclusions regarding the state of mind that prevailed in Europe during the past year. A. Roubé-Janski gave us *Écume*; Georges David, *Passage à niveau* (about the hopeless destitution in poorer classes); Yves Gandon, *La Belle inutile*; Mme. Simone, *Jours de Colère* (family drama). M. Guilloux's *Sang noir* betrays a particularly harsh yet pathetic attitude toward one unable to adjust himself to conditions and who finally commits suicide. Quite as depressing is Luc Diétrich's *Le Bonheur des Tristes* (which seems written by a disciple of Céline, author of *Voyage au bout de la Nuit*); again horrors were featured by Pierre Audiat, in his *La Porte du Fond*, that reminded one of Dostoevski and suggested, as one critic says, "La rédemption par le bas, la recherche de la lumière dans les ténèbres"; Jacques Debrü-Bridel, in *Jeunes Ménages*, tells the story of a sort of Poil de Carotte. To that class belong novels of the school called "Populiste"; E. Dabit, his most productive representative, offered *La Zone verte*, in which the sordid conditions, preferably described by these writers, are shown to exist in a suburb of Paris. Marcel Aymé, *Maison Basse*, tells in his crude manner a love story of a mother which brings about the death of her daughter. Francis Carco

adds two volumes to his series of gloomy tales: *Ténèbres* (a novel that reminds much of his famous *Homme traqué*), and *Brûmes*. Pierre Hamp, in *Glück auf!*, takes the reader among the miners of the Saar.

Novels of country life: M. Genevoix, *Marcheloup*; C. Silvestre, *La roue tourne*; and, specially praised, Léon Boquet, *Heurtebise*. Raoul Stephan's *Becgrun* is a sort of epos of the vineyard.

Novels of which the *mise en scène* is Spain: First of all, the Prix Goncourt for 1935: Joseph Peyre, *Sang et Lumière*, torero story, Marilena, being the fatal woman, cannot help reminding one of Carmen; R. Escholier, *Maripépa*, very passionate and somewhat sensual. A. Machou's *Trésor en Espagne* is a very entertaining account of a modern traveler.

Other exotic novels are: R. Bourget-Pailleron, *Cœur de Russie*; Constantin-Weyer, *Une corde sur l'abîme*. With scenes placed in Africa, Luc Durtain, *Yagouta aux Cavaliers* (Tunisia), a man victim of a Carmen; Jean d'Esme, *Fidèles*, adventure among primitives; André Demaison, *Le Jugement des Ténèbres*, white men disturbed by a tribunal of natives; A. Truphemus, *Ferhat, instituteur indigène*, the problem of adapting white people to Algeria; the very striking *Flambeurs d'hommes*, by M. Griaule; *Le Lépreux*, by H. de Monfreid (the last two in Abyssinia).

Sea novels include: E. Peisson, *Passage de la Ligne*, and *Chalutier 304*; R. Verce (Prix Goncourt, 1934) *Remorques*. Two war novels: Jean-Paul Vaillant, *L'Enfant jeté aux bêtes*, a bitter story of suffering and hardships, moral even more than physical, in the army; Michel Missofe, *La Confession d'un Combattant*—on the same note. A double spy story, *La Guêpe*, by Albert Touchard was awarded the Prix du Roman by the French Academy in June.

Novels by women: Rachilde came to the front once more with *La Femme-Dieu*, and kept to her psychology of hysteria; Princesse Bibesco contributed two tales with very different settings, one oriental, *Le Rire de la Naiade* (romanesque and "recherché") and *Egalité*, a lady of high birth and man with communistic ideas meet (a theme now somewhat obsolete); André Corthis (author of *Pour moi seule*), *Le merveilleux Retour*, a provincial setting, feminine psychology; Colette Yver, *Les deux Cahiers de Pauline*; Marie LeFranc, *La Rivière solitaire*; Germaine Beaumont, *Perceneige*. The Prix Femina for the year went to Claude Silve, for *Bénédiction*, a story with setting in an old castle and with some characters who belong rather to the domain of dreamland than to that of reality; it even includes a scene of incantation by a witch. A story that one would hardly expect to be told by a woman is Thérèse Herpin's *Yoloch, le Maléfique*, which deals with the life of the convicts in French Guiana.

Among the successful novels of a light, merry, or sportive character were: *L'Alouette aux Nuages*, by Maurice Bedel (it is the lark of Saint-Germain des Prés which philosophizes in her own way); *La Dame de Malacca*, by Francis Croisset, tells of the amusing situations arising out of the love of an Irish girl for an Asiatic. Louis Latzarus, *Une Femme entra et Le Vivier*, by H. Troyat, received a hearty welcome from the press, as did *Grelu*, by Léopold Chauveau. The admirers of Jacques Rivière issued his posthumous *Florence* which seems to be also autobiographical.

A much acclaimed movement was that of the "Renaissance de la nouvelle" (as if the short story

in France needed resurrection!), and a new collection was started under the direction of Paul Morand (Nouvelle Revue Française, publishers). Several of the following titles belong to that series: Pierre Mille, *L'Homme qui ne savait rien* (all stories deal with Russia); A. de Chateaubriant, *La Meute* (much discussed, 3 récits and 3 contes); E. Jaloux, *Trois nouvelles*; H. Duvernois, *La maison*; Pierre Bost, *Un grand Personnage*; Jacques Boulenger, *Contes de ma Cuisine*; Claude Farrère, *Le Quadrille du Mur de la Chine*; Joseph Peyre, *Coups durs*; Jean Cassou, *De l'Etoile au Jardin des Plantes*; J. H. Rosny, *La Vampire de Bethnal Green* (the occult world); P. Dominique, *Une Bouche au Palais* (political); Jean Tousseul, *Le Masque de Tulle*; Marguerite Yourcenac, *La Mort conduit l'Attelage* (medieval and gloomy); Irène Nemirowski, *Films parlés*.

Poetry. Judging by the year's crop of poems poetry is certainly not dying in France. Francis Jammes's *De tous temps à jamais* has been called "le plus franciscain de ses livres," and yet one finds pagan notes as well as Christian ones, that recall Theocritus, LaFontaine, and Virgil. The same may be said of Mario Meunier who, in his *Hymnes philosophiques* exalts philosophical themes as they are associated with such great names as Aristotle, Jesus, Marcus Aurelius, Cleanthes, Julian the Apostate, etc. Robert Guy d'Helle wrote an allegorical poem, *La Geste du Vase de Soissons*, while Marcel Diamant-Berger resuscitated in *Thulé, la vraie Thulé*, the gods of the mythology of the North. Luc Durtain, in his *Quatre Continents* offered, in choppy style, reminiscences of his endless travels. Verse of very high class was provided by the poems, in traditional style, of Henry Derieux, *Face à face* (awarded the Prix Léon Dièrx); Amélie Murat (Prix Moréas in 1930), *Le Chant de la vie*; Ernest Chavost, *L'Hosanna des quatre Saisons*; Phil. Chabeneix (author of *La Couronne d'Ophélie*), *Comme le feu, 24 sonnets élégiaques*; Cl. Chardon, *Trois Roses Dauphiné*; Jean Deschieux (a Belgian), *Rythmes*; Robert Honnert, *Lucifer*; André Berry, *Corbeille de Gislaine* (pretty verses for a betrothed girl); G. Audisio, *Bucelle* (songs of an everlasting traveler who never finds joy and always regrets what he has left); Tristan Derème, *Le Violon des Muses*. The cheerful note was struck by Raoul Raynaud, *Du Sourire à Don Juan* (first and last titles), and Georges Fourest (called "le virtuose de la cocasserie"), *Geranium ovipare*.

Religious poetry was represented chiefly by the Abbé François Ducaud-Bourget's moving *Oblation*; also by Camille Belloy (a Belgian), *Le Chemin de la Croix*. Anti-religious: *L'Enfer*, by Patrice de la Tour du Pin; Marius Scalesi, *Poèmes d'un Mandat*.

Quite a group of poets still hold that poetry, to deserve the name, must be cryptic; among these: Pierre Gueguen, *La Chasse du Faon* (symbolistic in idea as well as in language); Julien Gonzague Frick, *Ingrès* (the author is a friend and was a follower of Apollinaire, and how! "Isorrhopastique," "Cybistique," and "Telesme" are the titles of some poems, and he calls himself "lunulant"); and Gisele Frassinis, *La Sauterelle arthritique* with a foreword by Eluard. Somewhat interesting was the attempt of Claudion Bauquier, in *Bou-Guerre et autres poèmes sur parfums violents et les violences du temps*, to evoke the Orient and Africa with imitative rhythms and cadences borrowed from primitive tribes. François Drujon, in *Mysthístoria*, in his clever irony reminds one of the late Laforgue,

Emile Langlade takes us into *Le Monde des Chats*. Mme. Thérèse Aubray in *Je viens en fraude* betrays a kind of sensuality which might cause us to imagine her jealous of the laurels of Mme. de Noailles.

Poetry was discussed in several books: Tristan Tzara, the former leader of the Dadaists, *Grains et issues, essais poétiques*; Jean Cassou, *Pour la poésie*; and, more original, Jean Royère, *Le point de vue de Sirius*, which makes connection with the discussion on "la poésie pure." Henri Dérioux, who won the Prix Dierx, was publishing *Poésie Française contemporaine, 1885-1935*. The Prix Jean Moréas went to Fernand Dauphin for his collective works, the Prix Edgar Poe to Charles Corm, and the great (15,000 fr.) Prix Petitdidier to Fr. Bernouard for his four little volumes.

Theatre. The year began under such gloomy auspices that one of the most successful playwrights, H. Lenormand, announced the doom of the stage. Of the early productions *Crépuscule* (Daxen) pictures a poor author whose play is shamefully altered by an impresario who has no other aim but to please the public and to star an actress. A little later, Fr. Porché directed a violent and specific attack, "Orage sur la Comédie Française," (*Revue de Paris*, June 1). Perhaps the first plays of the year warranted pessimism: Salacrou's *Les Frénétiques* (3 acts) was not particularly successful in its picture of the world of the cinema; Jacques Deval's *L'Age de Juliette*—two young lovers who despair of life want to leave the world and finally are rescued from a suicide pact; and *Marie Galante*—a courtesan who has a longing for her little village, were not acclaimed as masterpieces; Jacques Chabanne's *Vel d'hiv* (Vélodrome d'Hiver) offered a mixture of sentimentality and realism in a picture of a champion cyclist accepted as a lover by a puritanic bourgeoisie; Jean Arnouille's *Y avait un prisonnier* did not convince by its presentation of an unscrupulous financier who after spending 15 years in prison returns to find his family have developed the same inclination for fraud, and he now preaches them ethics. Less severely criticized were: *Rouge*, by H. Duvernois, a story of a young preceptor who pretends to be a communist, converts a young girl and is sorry for it—finally the situation is cleared up and marriage ensues; Maurice Rostand's *Le Procès d'Oscar Wilde* (presented as a piece of shameful hypocrisy); Boutet et Aragny's *Aliette* (theme of Maupassant's *Yvette*, a girl ashamed of her mother's "profession"); Jean-Albert's *Hôtel de masques* (a man mistaken for a contemptible fellow by his wife and for a hero by his mistress, and later the order is reversed); P. A. Breal, *Trois camarades* (Three Chums); Verneuil, *Trouble* (edging on Freudism). Judged unequivocal failures were *Une jeune fille à rêvé*, by La Gouiriade (unnecessarily "brutal") and *Girouette*, by R. Benjamin, a satire of military and political life.

The most successful plays were historical; early in the year François Porché scored with *Un roi, deux dames et un valet*, picturing the deadly rivalry between Mme. de Montespan and Mme. de Maintenon; then Jean Sarment, with *Madame Quinze*, meaning Mme. de Pompadour; then Albert Jean with *Gille de Rais*, a vindication of Bluebeard who is presented as a "cavalier" servant of Joan of Arc and has really no other aim except to make his subjects happy; finally, two great successes of the end of the year: Young André Jossot's *Elizabeth, la femme sans homme*, the English queen, torn between her fondness for Essex and her instinctive repulsion for love, following a fearful experience,

when a girl, at the hand of a male servant; and Edouard Bourdet's *Margot, comédie historique*, about the vivacious and light-hearted wife of Henry IV, authoress of the *Heptameron*—Marguerite de Valois et de Navarre. Another, a play of fancy, by Giraudoux, *La Guerre de Troie n'aura pas lieu*.

A play that deserved better than fate decreed was Maeterlinck's *Princesse Isabelle*, a combination of a fairy tale and actual dream of a "petite bijoutière" who believes herself loved by a prince—this is the old Maeterlinck of the days of *Pelléas et Mélisande*. Stève Passeur had public opinion divided on the merits of his *Je vivrai un grand amour* (played by the Pitoeffs), the story of a girl who sees her lover taken away from her by an adventurer; the man soon realizes his blindness and wants to come back; but she prefers to remain with her illusion of the great love and sends him away.

In the field of comedy, Sacha Guitry gave successfully *La fin du monde*, but less so *Quand nous jouons la comédie* (in which he succeeds in fooling the audience to the last minute, not knowing whether they witness a real play or a play in a play). The great humorous success was Jean de Letraz's *Bichon* (acted by V. Boucher) at the Michodière. The Palais Royal gave *La Dame de Vitte*, by Roger-Ferdinand et G. Dolley. In the same vein were Paul Nivoix's *La mariée éprouvée*; Beer et Verneuil's *Les Fontaines lumineuses* (a satire on women who are only the reflection of what men make them), and Yvan Noé's *La Femme qui se met en quatre*.

As in recent years, one may almost say that more revivals were successful than new plays. Among the revivals were several Hugo plays (in commemoration of the fiftieth anniversary of the author's death) and Dumas' *Henri III et sa cour*. Then, *Le Courrier de Lyon*, old melodrama by Moreau, Siraudin, and Delacour; *Les Amants* by Donnay; *Terres inhumaines* by Curel; *Madame Sans-Gêne* by Sardou; *Le Petit Café* by Tristan Bernard; *Les Oiseaux*, the new Zimmer version of the Aristophanes play given two years ago by Dullin.

Plays from other countries: Shakespeare's *Rosaland*, given by Copeau; Calderon's *Médecin de son honneur* (adapted by Arnoux); Goldoni, *Valet de deux maîtres*; Bruckner, *La Créature*; and a play borrowed from Dickens, *Le Grillon du foyer*, arranged by Francmesnil, which was a great success at the Odéon.

The Prix Brieux was awarded to Paul Brach, author of *Règne D'adrienne* (1934).

Miscellaneous. Autobiographies continue to rain down on us: H. Lavedan, *Ecrire* (2d vol. of Memoirs); Cahiers of Maurice Barrès, vol. ix, years 1911-12; Cécile Sorel, the actress, *Souvenirs*; Henry Bordeaux, *Le pays sans ombre* (childhood); Abel Hermant, *Souvenirs de la vie mondaine* (introduced young in society by his family connections); R. Carco, *Mémoires d'une autre vie* (terrible if not exaggerated); Jean Cocteau, *Portraits-souvenirs*. Under this head one may place: Romain Rolland, *Quinze ans de combats, 1919-1934*; A. Gide, *Nouvelles Nourritures* (sequence to *Nourritures terrestres*, a sort of philosophical testament made out of scraps of diary and showing the author very near a return to Christian ideas via communism). Mme. Marie Scheikervitch, *Souvenirs des temps nouveaux*; A. Maurois, *Sentiment et coutumes*; Paul Morand, *Rond-Point des Champs Elysées* (his Chroniques in the *Figaro*). In contrast, Jean Lasserre, *Paris-misère* (descriptions of the slums of the "zone de Paris"); and César

Fauxbras, *Viande à brûler*, *Journal d'un chômeur* (very bitter).

Abel Hermant gave an allegorical-historical interpretation of the reign of Nero in *Poppée, l'amante de l'Anti-Christ*. A sort of saga of the triumphal days of Islamism was begun by Jean and Jérôme Tharaud: *Les 1001 Jours de l'Islam*, vol. i, "Cavaliers d'Allah" (to be followed by ii, "Les Grains de la Grenade," iii, "Le Rayon Vert," Funk). Brentano published two valuable books on *La Renaissance*, and *Luther*. Armand Praviel, *M. Vincent chez les Turcs (Saint Vincent de Paul)*. André Suarès (who won the Grand Prix de l'Académie) offers *Trois hommes, Pascal, Ibsen, Dostoïewski*. François Porché, *Portrait psychologique de Tolstoï*. A picture of French society in the first half of the 19th century is found in J. Berthaud, *Le Faubourg Saint-Germain*. Octave Aubry published one of his excellent works of history, *Saint-Hélène* (2 vols.); and Jean Rostand one of his stimulating studies which remind one of Michelet or Maeterlinck, *La vie des Libellules*. Finally, mention must be made of Julien Benda's *Délices d'Eleuthère*—i.e. delights in pure thought (the spirit of Renan or Gourmont).

FRENCH SOMALILAND. See SOMALILAND, FRENCH.

FRENCH SUDAN. See FRENCH WEST AFRICA.

FRENCH WEST AFRICA. A French colonial empire comprising the colonies shown in the accompanying table.

Colony	Sq. m.	Pop. (1931)	Capital
Dahomey	47,131	1,112,000	Porto Novo
Dakar *	61	53,982	Dakar
French Guinea	96,838	2,236,968	Conakry
French Sudan *	581,383	3,568,825	Bamako
Ivory Coast *	184,247	3,885,153	Abidjan
Mauritania	322,252	323,819	St. Louis *
Niger *	482,577	1,810,953	Niamey
Senegal	77,731	1,584,273	St. Louis
French West Africa .	1,792,220	14,575,973	Dakar

* Including Dependencies. * Upper Volta ceased to be a colony on Jan. 1, 1933, and its territory and population were divided among three other colonies as follows. French Sudan received 20,226 sq. miles and 713,167 inhabitants; Ivory Coast, 59,212 sq. miles and 2,018,837 inhabitants; Niger, 27,290 sq. miles and 268,239 inhabitants. * The lieutenant-governor of Mauritania resides in St. Louis in the colony of Senegal.

Chief towns: Dakar (capital), 42,000 inhabitants in 1931; Saint Louis, 30,000; Porto Novo, 27,000; Bamako, 25,129 (1932); Abidjan, 17,718; Ague, 20,009; Diourdel, 15,402; Abomé, 15,049; Rufisque, 14,623.

Production and Trade. The main products (in metric tons) were groundnuts (1933), 800,000; maize (1933), 511,500; palm and palm kernel oil (1934), 49,600; cotton (1933), 3900; cacao (1933), 31,087; tobacco; bananas; cabinet woods; coffee; and gum. Gold exported in 1934 amounted to 3078 kilograms. In 1933, imports were valued at 633,026,000 francs (textiles, fuel oil, mechanical implements, food substances, and beverages were the main items); exports, 498,950,000 francs (franc averaged \$0.0501 for 1933).

Communications. On Jan. 1, 1934, there were 2355 miles of railway in operation, 22,126 miles of telegraph, and 327 post offices. During 1933, 9910 ships aggregating 9,326,321 tons entered and cleared the ports.

Government. For 1934, the various budgets (in 1000 francs) were balanced as follows: general budget, 164,397; the aggregate of the local budgets, 390,433; supplementary budgets, 257,831 (franc

averaged \$0.0657 for 1934). A governor-general, aided by a council, governs the whole of French West Africa. Each colony was under the direct administration of a lieutenant-governor, and Dakar and Dependencies was under a governor of colonies, all subordinate to the governor-general who was relieved of the direct administration of any part of his government so that he could direct and control the common interest of all the colonies. Governor-general in 1935, M. J. Brévié (appointed in 1930).

FRIENDLY ISLANDS. See TONGA ISLANDS. **FRIENDS, RELIGIOUS SOCIETY OF.** A mystical religious sect which originated in England in the middle of the 17th century under the leadership of George Fox. For early history see THE NEW INTERNATIONAL YEAR BOOK for 1932 and THE NEW INTERNATIONAL ENCYCLOPEDIA, vol. ix, pp. 285 and 286.

Five Years' Meeting. In 1902 the largest body of the Religious Society of Friends, known as the Orthodox Group, organized the Five Years' Meeting. This organization meets as a delegate body every five years and in 1935 consisted of 12 Yearly Meetings, with a membership of approximately 78,000. Its headquarters are in Richmond, Ind. The work of the various departments, such as missions, peace, prohibition and public morals, religious education, is under the direction of executive committees and secretaries of boards. The Five Years' Meeting also maintains seven colleges for higher education: Earlham, in Richmond, Ind.; Wm. Penn. in Oskaloosa, Iowa; Guilford, in Guilford, N. C.; Wilmington, in Wilmington, Ohio; Whittier, in Whittier, Calif.; Nebraska Central, in Central City, Nebr.; and Friends University, in Wichita, Kans. Haverford College in Haverford, Pa., is maintained by the Philadelphia Yearly Meeting and Pacific College in Newberg, Ore., by the Oregon Yearly Meeting. The latter bodies, however, and the Ohio Yearly Meeting are not a part of the Five Years' Meeting. In 1935 the membership of the Oregon Yearly Meeting was 3187; of the Ohio Yearly Meeting, 6289; and of the Philadelphia Yearly Meeting (Orthodox), approximately 4730. *The American Friend*, a bi-weekly religious journal, is published at headquarters. The next sessions of the Five Years' Meeting will occur in October, 1940.

Liberal Branch. This branch was formed in 1827 from a division focused on the preaching of Elias Hicks and the doctrinal issues of the day. It includes six Yearly Meetings federated in the Friends' General Conference, which meets in even numbered years and conducts work in religious education, social service, and advancement of Friends' principles. The membership in 1935 was 16,219. Publications include the weekly periodical, *Friends' Intelligencer*. The society cooperates with all branches of Friends in supporting the American Friends' Service Committee for work for peace and social justice. Headquarters are at 1515 Cherry St., Philadelphia, Pa.

FROST, EDWIN BRANT. An American astronomer, died at Chicago, May 14, 1935. Born in Brattleboro, Vt., July 14, 1866, he received his education at Dartmouth College, graduating in 1886. The following year he became an instructor in astronomy there, and in 1892, assistant professor and director of the observatory. For two years previous he studied at Princeton University, Strassburg, and the Royal Astrophysical Observatory at Potsdam. He attained the status of full professorship at Dartmouth in 1895 and three years later was appointed

to the faculty of the University of Chicago as professor of astrophysics. In 1905, he was made director of the Yerkes Observatory which then contained the largest telescope in the world.

In 1920 he lost his sight, but undaunted, kept in close contact with the astronomical world. He attended the solar eclipse at Westbrooke, Me., on Aug. 31, 1932, and listened to a description given by a member of his family. In that year he retired as director emeritus from Yerkes Observatory.

Dr. Frost's special forte was astrophysics in relation to astronomy, and his researches include particularly stellar velocities in the line of sight, stellar spectroscopy, sun-spots, and thermal radiation of the sun. He devised the plan whereby the light rays of Arcturus were utilized to throw the master switch of a powerful searchlight at the Century of Progress Exposition opening at Chicago in 1933.

For 40 years, Dr. Frost served editorially on the *Astrophysical Journal*, being its editor from 1902. He contributed to many astronomical reviews both in the United States and abroad and edited various publications of the Yerkes Observatory. In 1894 he translated, revised, and enlarged, *A Treatise on Astronomical Spectroscopy* by Dr. J. Schreiner, under whom he had worked at Potsdam. In 1933 he issued his autobiography, *An Astronomer's Life*. He was a member of many astronomical and scientific societies, and the asteroid "Frostia" was discovered by and named for him.

GABUN. See FRENCH EQUATORIAL AFRICA.

GAILOR, THE RT. REV. THOMAS FRANK. An American Bishop of the Protestant Episcopal Church, died at Sewanee, Tenn., Oct. 3, 1935. He was born in Jackson, Miss., Sept. 17, 1856, and educated at the Memphis Public Schools, later attending Racine College in Wisconsin, graduating in 1876 with high honors. He then entered the General Theological Seminary in New York, and in 1879 was graduated with the degree of S.T.D., and the Greek prize. In that year he was ordained to the diaconate of the Protestant Episcopal Church and accepted a call to the Church of the Messiah at Pulaski, Tenn. The following year he was ordained priest on September 17, and in 1882 accepted the appointment of professor of ecclesiastical history at the University of the South. A year later he became chaplain of the University of which, in 1890, he was appointed vice-chancellor and executive head. Also, in that year he was elected Bishop of Georgia, but refused the office, as he did call to Chicago and New York, on the grounds that the University needed his services during this critical period of its existence.

However, three years later, he felt that the University's foundation was more secure and he accepted the position of Bishop Coadjutor of Tennessee. On the death of Bishop Quintard in 1898, he succeeded to the Bishopric. He served from 1916 to 1922 as chairman of the House of Bishops of the Protestant Episcopal Church. In 1919, he was one of the Bishops who fought for the administrative reorganization of the church. Up to that time the bishop who had been consecrated the longest held the office of presiding bishop. This was changed so that the office of presiding bishop was made elective and the National Council was set up to serve as the administrative body. Dr. Gailor was the first Presiding Bishop of the Church to be elected, and from 1922-25 served also as president of the National Council. He retired in 1926, believing that the administration of the Church's affairs should be in the hands of younger

men. While serving as president he held the highest office in the Church. The Bishop was neither one of the Anglo-Catholic group nor a low churchman, in the usually accepted meaning of the term. He was conservative in his views and stood staunchly behind the prayer book, which often led him to side with the high churchmen.

In 1908 he became Chancellor of the University of the South and president of the Board of Trustees, and on July 25, 1933, he celebrated the 25th year of his accession to that post as well as the 40th anniversary of his elevation to the episcopate. He was one of the first Bishops of his Church to take a stand against the 18th Amendment. Bishop Gailor was appointed a delegate to the Lambeth Conference of 1920, and in 1923 headed the committee sent to Japan to distribute an emergency relief fund. He served as a vice president of the American Chamber of Commerce and was sent as a delegate to the International Chamber of Commerce held in Paris in 1920, and in that same year was a delegate to the Protestant Ecumenical Conference, at Geneva, the first held there since the Reformation. His long career in the services of his Church and the University of the South won for him many academic honors, including the degree of D.D. from Oxford University.

Dr. Gailor was the author of many books, among which may be mentioned, *A Manual of Devotion* (1887); *The Apostolic Succession* (1889); *Things New and Old* (1891); *The Puritan Reaction* (1897); *Apostolic Order* (1901); *Christianity and Education* (1903); *The Episcopal Church and Other Religious Communions* (1904); *The Communion of Saints* (1908); *The Christian Church and Education* (1910); *The Episcopal Church* (1914).

GALAPAGOS ISLANDS. See EQUADOR.

GAMBIA. A British West African colony and protectorate. Total area, 4003 sq. miles; total population (1931), 199,520. Most of the 14,370 inhabitants of the island of St. Mary resided in the capital town of Bathurst.

Production and Trade. The cultivation of groundnuts was the main industry. A large quantity of foodstuffs was grown for local consumption, including rice, maize, guinea corn, cassava, sweet potatoes, etc. Cotton was grown and used locally. Palm kernels, hides, and wax were other products. In 1934, imports (including specie of £4326) were valued at £326,175 of which cotton piece goods accounted for £78,964; exports (including specie of £53,900), £455,749 of which groundnuts (71,919 tons) represented £387,345.

Government. For 1934, revenue amounted to £221,564; expenditure, £174,663. The area of the colony (consisting of Bathurst and Georgetown and adjacent land) was 69 sq. miles but by an ordinance enacted in 1902 all the Gambia, with the exception of St. Mary's island (4 sq. m.) was placed under the protectorate system of government. Gambia is ruled by a governor aided by an executive council and a legislative council. Governor and Commander-in-Chief in 1935, A. F. Richards.

GANDHI, M. K. See INDIA under History.

GARBAGE AND REFUSE DISPOSAL.

Many garbage and refuse incinerators were built, put under construction, or projected during 1935. New York City, as befits its size, leads in number and capacity of incinerators. On completion of two being replaced, it will have 24 plants with a combined daily capacity of 7480 tons of garbage and combustible refuse. Among the cities that completed or contracted for incinerators in 1935 (with ca-

capacities in tons) are: Cleveland, Ohio, 900; Columbus, Ohio, 150 and 100; Newton, Mass., 120; Nashville, Tenn., 124; Williamsburg, Va., 45. Litigation held up the opening of bids on December 4 for a 1400-ton project at Detroit for 4 plants: 1 of 450, 2 of 350 each, and 1 of 250 tons. This was a PWA project in the name of Wayne County. One of the reasons urged for an injunction was that as a PWA project an unconstitutional delegation of power was proposed. Controversy at Pittsburgh, Pa., continued to hold up a project for a 600- and a 300-ton incinerator for which contracts were awarded in 1934.

Bids for incinerators were received late in 1935 by the cities of Herkimer and Lockport, N. Y., and Wilkes-Barre, Pa. Plans for a garbage and rubbish incinerator at Rochester, N. Y. to supersede a refuse-sorting and salvaging plant built over 20 years ago and to supplement a garbage reduction plant built 15 years ago were ready at the close of the year, with a prospect for taking bids in 1936. The Herkimer incinerator will be operated in conjunction with a sewage-treatment plant. Gas developed in the sewage-sludge digestion tanks will be stored in a gas tank and drawn upon as needed to help burn the garbage and refuse, the percentage of the latter being too low to supply sufficient combustible. At an existing incinerating plant in Philadelphia the city has put in boilers to utilize waste heat from the incinerators and has built 12 garbage digestion tanks. The steam raised by the boilers is used to extract grease from the garbage. The residue, or tankage, will be incinerated without first being pressed to reduce moisture.

Grinding. After watching small but working-scale experiments with grinding garbage conducted by several cities, and making a trial of its own in the summer of 1934, St. Louis, Mo., on February 10, began grinding all its garbage, then dropping it into a sewer leading to the Mississippi River as a final means of disposal. The grinding plant has a capacity of 30 tons per hour. For safety in case of emergencies and at peak hours its duplication is proposed. So far as is known, St. Louis is the first city anywhere in the world to grind all its garbage as a permanent plan. Several cities have experimented with grinding a portion of their garbage and treating it with their sewage. This was done some years ago at Lebanon, Pa., and within the past two or three years at Schenectady, Baltimore, and Indianapolis, and at three universities: Harvard, Illinois, and California. The engineer of the Schenectady sewage-works concluded that combined garbage and sewage-works were advisable and recommended them but the plan was not adopted by the city authorities. Elsewhere, garbage grinding and treatment with sewage is thought to need further study before permanent use, but at Indianapolis the practice was adopted May 10, after previous experimentation, for use while the old riveted-steel garbage-digestion tanks are being replaced with welded-steel tanks.

GAS. Manufactured. From the data reported by 262 companies throughout the United States, whose sales of manufactured gas constitute more than 90 per cent of the total sales, the Statistical Department of the American Gas Association reported a very slight decline in total revenue for the year 1935, although an increase of 3.6 per cent in total sales. The total sales for the year amounted to 372,022,800 cu. ft. of gas, productive of \$381,351,900 in revenue; in 1934 total sales aggregated 359,138,100 cu. ft. at a revenue of \$381,666,300. Domestic use, aside from house heat-

ing, continued to drop both in volume and in revenue, as shown in the accompanying table; and the use of gas for house heating, which showed a rise of 42 per cent in volume in 1934 over 1933, continued to rise in 1935 with a further gain of 24.1 per cent in volume and 20 per cent in revenue.

Gas Sales (MCF):	1935	1934	Per cent change
Domestic	232,645,700	238,422,800	- 2.4
House Heating	39,323,000	31,697,300	+24.1
Industrial and commercial	97,836,800	86,877,400	+12.6
Miscellaneous	2,217,300	2,140,600
Total	372,022,800	359,138,100	+ 3.6
Revenue (Dollars):			
Domestic	286,849,100	293,631,800	- 2.3
House Heating	23,294,400	19,433,600	+20.0
Industrial and commercial	69,658,600	67,079,500	+ 3.8
Miscellaneous	1,549,300	1,521,400	.. .
Total	381,351,900	381,666,300	- 0.1

Natural. On the basis of the reports of 171 companies in New York, Pennsylvania, Ohio, West Virginia, Kansas, Louisiana, Oklahoma, Texas, and California, whose total sales of natural gas aggregate almost 90 per cent of the utility sales in those States, the Statistical Department of the American Gas Association reported a gain of 11.4 per cent in gas sales and a gain of 9.4 per cent in revenue in 1935 over the preceding year. The total volume of sales in 1935 amounted to 1,021,922,000 cu. ft. as compared with 917,338,500 cu. ft. in 1934; total revenue for the year was \$344,146,100 as against \$314,461,700 in 1934. Details of the gains in the several classifications are shown in the accompanying table.

Gas Sales (MCF):	1935	1934	Per cent change
Domestic (Including House Heating)	304,603,300	283,388,600	+ 7.5
Commercial	72,914,400	64,680,900	+12.7
Industrial	630,826,900	557,668,000	+13.1
Miscellaneous	13,577,400	11,601,000	.. .
Total	1,021,922,000	917,338,500	+11.4
Revenue (Dollars)			
Domestic (Including House Heating)	206,966,400	193,683,500	+ 6.9
Commercial	33,753,800	30,269,900	+11.5
Industrial	101,481,900	88,690,000	+14.4
Miscellaneous	1,944,000	1,818,300
Total	344,146,100	314,461,700	+ 9.4

GEOGRAPHICAL SOCIETY, AMERICAN.

An organization, founded in 1852, to collect and disseminate geographical information by discussion, lectures, and publications; to establish in the chief city of the United States a place where there may be obtained accurate information concerning every part of the globe; and to encourage such exploring expeditions as seem likely to result in valuable discoveries in geography and related sciences.

The society has taken a leading part in the study of polar geography, and some of the polar expeditions of recent years, particularly the aerial expeditions, have been under its auspices. To many more it has furnished maps and especially designed charts and other devices for the simplification of air navigation. It maintains a department of technical training, which conducts research in field astronomy, mapping, and navigation and provides short-term courses in mapping for explorers. Important contributions to the development of geographical science and exploration are recognized in elections to honorary and corresponding memberships and in the bestowal of medals.

The society sponsors six regular lectures annually by distinguished explorers or geographers. In its quarterly, the *Geographical Review*, there were published during 1935 several notable papers dealing with the much discussed problems of land utilization and settlement in different regions, as well as with recent explorations and other phases of modern geographical research. Early in January, 1936, the society was to publish a comprehensive volume on land and society in Chile by Prof. G. M. McBride. There also were completed 20 additional sheets of the society's map of Hispanic America, published in conformity with the International Millionth Map of the World and bringing the total of completed sheets to 70 out of 100.

On July 1, 1935, Dr. Isaiah Bowman, who had served as director of the Society since 1915, assumed the presidency of the Johns Hopkins University, Baltimore. The president of the society in 1935 was Roland L. Redmond; the secretary was R. R. Platt. Headquarters are at Broadway and 156th Street, New York City.

GEOGRAPHIC SOCIETY, NATIONAL. An organization for "the increase and diffusion of geographic knowledge," founded in Washington, D C, in 1888. In 1935 the Society, cooperating with the U.S. Army Air Corps, successfully explored the stratosphere to a height greater than ever before reached by man. The balloon *Explorer II* was sent to a new world altitude record of 72,395 feet (13.71 miles) and during the flight the most comprehensive programme of scientific research ever attempted in the upper air was carried out. The balloon, largest ever built, with Capt. Albert W. Stevens as commander and Capt. Orvil A. Anderson, pilot, rose from a natural bowl in the Black Hills near Rapid City, So. Dak., at 7:01 A. M., mountain time, on November 11, achieved its maximum altitude at 11:40 A. M., and returned to earth without mishap at 3:14 P. M. near White Lake in eastern South Dakota. A 17-foot rip in the balloon, occurring during inflation, was successfully repaired on the spot before the take-off.

The *Explorer II* had a gas capacity of 3,700,000 cubic feet. Its spherical metal gondola, made of a magnesium alloy lighter than aluminum, was 9 feet in diameter. The balloon, inflated with helium, carried a weight of 8518 lb. including gondola, instruments, ballast, and crew of two. Captains Stevens and Anderson were awarded the Hubbard Gold Medal, the highest honor of the Society, for geographic achievement. An illustrated account of the flight by Captain Stevens appeared in the *National Geographic Magazine* for January, 1936.

The Second Byrd Antarctic Expedition, to which modest grants were made by the Society, returned to the United States in May. Rear-Adm. Richard E. Byrd, U.S.N., ret., reported to the Society new explorations showing that Antarctica is a single continent and not divided by a strait as some explorers had believed. Traveling thousands of miles by aeroplane and dog sled, members of the Expedition discovered a vast new plateau and largely remapped the continent's Pacific quadrant. The Society accorded a reception to the expedition personnel upon their return to Washington, D. C., and presented an illuminated scroll to Admiral Byrd, who already had received the Society's Hubbard Gold Medal and a Special Gold Medal of Honor, setting forth the contributions to geography made by his various expeditions. The first complete illustrated report of the expedition by Admiral Byrd appeared in the October *National Geographic Magazine*.

The Society's Yukon Expedition led by Bradford

Washburn accomplished the first crossing of the lofty St. Elias mountain range on the Alaska-Yukon (Canada) border, removing a 2000 sq. mi. blind spot from the map of that region. In Idaho, an expedition of the Society, cooperating with the U.S. Geological Survey, traversed 300 miles of the turbulent Salmon River through its forbidding and little-known canyon, one of the largest primitive areas in the United States.

To aid its million members and the public generally in following fast-shaping world events, the Society in 1935 issued new maps of the World, of Africa, and of Ethiopia. The World map, 44 by 23 in., with new data based in part on the Society's own explorations, is the first to show Antarctica as a single continent, as determined by Admiral Byrd. The map includes new islands in the Arctic north of Asia, and shows the route of the new American air line across the Pacific. The new map of Africa, 31½ by 29 in., shows the routes of many new motor roads, airways, and recent boundary changes.

In the *National Geographic Magazine* for 1935 many interesting, varied, and timely articles were published, including those on Ethiopia, Eritrea, the Suez Canal, Aden, and the Maltese Islands; Amelia Earhart's description of her flight from Hawaii to Oakland, Calif. (May); "Ancient America's Finest Sculptures" by Dr. J. Alden Mason, and a detailed description of Delaware, Maine, Minnesota, and Pennsylvania. A new Cumulative Index to the Magazine from 1899 to 1934 inclusive was also issued.

Among the publications of the Society may be mentioned: *Hunting Wild Life with Camera and Flashlight*, by George Shiras, 3d; *Our Insect Friends and Foes and Spiders*, by several authors; the technical reports of the National Geographic Society-Army Air Corps Stratosphere Flight of 1934, and a technical monograph by Dr. A. E. Douglass, entitled *Dating Pueblo Bonito and Other Ruins of the Southwest*.

GEOGRAPHY. See ANTHROPOLOGY; EXPLORATION; POLAR RESEARCH.

GEOLOGY. The science of geology is not one which lends itself to rapid development over short periods of time. During the past year, however, a distinct trend could be noted in the greater detail with which both old and new problems in geology are being attacked. This has been especially noticeable in the physical-chemical investigations being carried on by a great many workers and the bearing of these fundamental studies on the complex processes by which the rocks, minerals and ore, making up the crust of the earth, are formed. The continued application of geophysical methods to the study of earth structures has received increasing attention and numerous cooperative projects involving the use of these methods are in progress. Such work should eventually lead to the accumulation of more exact data upon which a more accurate interpretation of the origin and history of the earth's crust can be made. The use of applied geology has been greatly increased by both private and governmental interests. Its application has been particularly marked in the study of the foundations for the large engineering structures such as are being carried on by the government at the present time, its use in flood control problems, water reservoirs, and in the continual search for new mineral deposits of value or in the development of known deposits.

Societies. The Geological Society of America held its 47th annual meeting at the University of Rochester, Rochester, N. Y., Dec. 27 to 29, 1934,

At this meeting the Penrose Medal of the Geological Society was presented to Charles Schuchert, emeritus professor of Paleontology, Yale University. Percy E. Raymond of Harvard University, a former student of Professor Schuchert, made the presentation address and called attention to the recipient's intense love of fossils in his early days which led him to learn more from nature than he might have learned from a professor, had an education been open to him. Dr. Raymond also spoke of the many contributions made by Professor Schuchert to the fields of paleontology, paleogeography and stratigraphy; to his widely used textbooks and finally to the great number of students whom he taught, helped, and influenced.

W. H. Collins, retiring president of the Society, chose as his address the subject "Geology and Literature." He stated that the generous bequest of Dr. R. A. F. Penrose to the Geological Society has tremendously increased its publication facilities and that it would be wise to consider where the Society was heading in the field of literature.

Most geological writings are written for geologists or those interested in the technical or practical phases of the science. Beautifully printed forms may be produced but it is not literature according to definition. The difference between literature and scientific writings was stressed. Literature is always concerned with some aspect of human affairs and the facts needed to give expression to the writer's conclusions may be changed to suit his purpose. Most scientific writings, on the other hand, usually have but little human interest and must be accurate.

The geologist, however, has two assets which could be put to greater use. He can draw upon the seemingly inexhaustible wonders of nature to stir the imagination instead of falling back upon interest in human affairs. He can excite the pleasure that every one has in the exercise of the reasoning faculty, for, though usually presented in a dull manner, every geologic problem is a potential mystery story.

Dr. Collins pointed out that many geologic papers are needlessly long and that others are unimportant. Only a few works in geology are read longer than during a single generation and one reason for the poor literary quality of geologic writings may be that but few of them are required to make a profit for the publishers.

The latter part of his address dealt with the small percentage of geological writings of wider appeal and the possibility of more writings of this type. In addition to his contributions to the knowledge of earth features and materials, the geologist should attempt to make his writings more inspiring and of broad, general interest. Much could be done towards developing the layman's interest in his surroundings by short descriptive articles on such things as public parks, etc.; essays; historical aspects of geology, including biography, and poetry. These are subjects well worthy of literary abilities.

In closing Dr. Collins repeated his reason for choosing this difficult subject as an address. He pointed out that there has been little time for cautious trial of the enlarged activities of the Society and that it would be surprising if there were not some mistakes made, some waste and, perhaps, some harm done. He felt that there was a definite and immediate need for the Society to consider as clearly and fundamentally as possible the problems resulting from the Penrose bequest.

The Paleontological Society of America met at

the same time and place. Percy E. Raymond, the retiring president of the Society, addressed a joint meeting on "Pre-Cambrian Life." This was considered a fitting subject to follow the address of C. K. Leith, retiring president of the Geological Society of America the preceding year, who had spoken on the pre-Cambrian.

Dr. Raymond pointed out that ever since Sir William Logan demonstrated that the Cambrian Rocks are not the oldest sediments, geologists and paleontologists have searched for evidence of life in the pre-Cambrian. He then reviewed all the important "finds" which have been accepted by many authorities and added that many doubts as to their organic origin still exist. Blue-green algæ, brown algæ, sponges, and "worms" have been found in some of the least metamorphosed of the pre-Cambrian rocks, but even though the organic origin of these is accepted, the classifications are more difficult to prove.

A study of Cambrian Fauna and Flora throws some light on the life that must have existed in the pre-Cambrian. These include naked Protozoa, siliceous sponges, primitive coelenterates, segmented "worms," inarticulated brachiopods, and trilobites or their ancestors. If these different types were all present in the pre-Cambrian why are there so few pre-Cambrian fossils? The theories offered to explain this were given:

(1) Destruction of pre-Cambrian fossils during the changes which took place in the metamorphism of the rocks. This holds for most of the pre-Cambrian strata.

(2) Daly's theory: Pre-Cambrian organisms had no skeletons because of the lack of available calcium in the sea. This theory has found considerable acceptance. He concludes that in the absence of an effective scavenging system there would be an accumulation of organic matter, which, on being decomposed by bacteria, would produce a great deal of ammonia, which would cause the precipitation of such calcium as was then in the ocean.

(3) Lane's theory: The pre-Cambrian oceans were acid, thus preventing the formation of calcareous skeletons.

(4) Walcott's theory: All the pre-Cambrian strata now accessible were deposited on land in fresh water of low calcium content.

(5) Chamberlin's theory: Organisms originated on land, in the soil, migrating thence through rivers to the oceans, which they did not reach until Cambrian times.

(6) Brooks' theory: The pre-Cambrian organisms lacked hard parts because they lived in the surface waters of the oceans, where skeletons would be detrimental, because of their weight.

(7) The speaker's modifications of the Brooks theory: Skeletons appeared as the result of the adoption of a sessile or sluggish mode of existence.

John E. Wolff, retiring president of the Mineralogical Society of America, spoke on the Crazy Mountains of Montana. A brief description of the topographic and geological features of the range was given, followed by a discussion of the many different types of alkaline and lime-alkali rocks which have been intruded into the area.

The following important papers were presented during the meetings of the Geological Society of America:

John P. Bulwalda and Beno Gutenberg spoke on the investigation of the Beartooth Overthrust by seismic methods. This was believed to be the first attempt to secure by seismic reflection methods

greatly needed information regarding the form of thrust surfaces. The results obtained were believed to demonstrate the feasibility of determining the altitude and form of overthrust surfaces by reflection methods.

In discussing geology in relation to the spread of man to North America, Ernst Antevs stated that man first spread to this continent after the culmination of the last glaciation and that a knowledge of geologic and climatic evolution of the late Quaternary enables one to rule out some epochs and to suggest others. Although Bering Strait could be crossed on ice, or in water crafts in summer, there probably was an ice barrier across entire western Canada. Geology can also be useful for the dating of finds of ancient man, particularly in glaciated regions, but also in the semi-arid Southwest, where past changes in moisture may have been the result of glaciation to the north.

David T. Griggs, in a paper on plasticity of rocks under high pressure, discussed an apparatus which permits the study of rock deformation under all magnitudes of confining pressure between that at the surface and that at a depth of 22 miles in the earth's crust. It is possible to study the change in the mechanical properties of the rocks with increasing confining pressure. He cited the change from the brittle condition to plastic flow; the increase in strength as the pressure is raised; and the relation between tension cracks, shear failure, and plastic flow.

"Glacial Anticyclones about Pleistocene Continental Glaciers of North America" was discussed by W. H. Hobbs. He cited the outwash plains of sand and gravel bordering the Greenland continental glacier which in fall and winter are dry due to lack of water from the melting ice and are swept by the fierce down-slope winds from the glacier. He described the stone lattice effects and pebble-armoured surface of the plain which are typical of deserts and pointed out that these features have been noted in the glaciated areas of North America, but as far as known they have never been satisfactorily explained.

The history of the Grand Canyon of the Yellowstone was discussed by Arthur D. Howard. According to R. M. Field, certain high level basalt patches along the lower course of the Yellowstone are remnants of a once extensive lava dam which blocked the Yellowstone valley and formed a great lake of which Yellowstone Lake was a part; and this flow was responsible for deposition of sediments, remnants of which occur along the walls and rim of the canyon. Howard pointed out that the high level basalts are older than the rocks in which the canyon is cut and that glacial damming to a great height is indicated by the distribution of glacial boulders. He concluded that such a dam satisfactorily explains all observed features.

Chester R. Longwell, in a paper on the geology of the Boulder Reservoir Floor, described seven different rock formations which make up the area and concluded that evidence suggests strongly that the Colorado has occupied essentially its present course since it first entered the region.

A. L. Lugin spoke on geologic evidence bearing on Pleistocene Man in Nebraska, saying that the Pleistocene deposits in Nebraska have been correlated with considerable certainty and that Yuma and Folsom types of human artifacts have been found which, on the basis of sedimentation, physiographic and paleontologic evidence seem to be not younger than Wisconsin or probably immediately pre-Wisconsin. The most convincing evidence

of Pleistocene man was found in 1934 at the base of deposits of Peorian age associated with mammoth, bison, and other remains. Human artifacts are also associated with fossil remains of Pleistocene vertebrates at a number of other sites and some may antedate the Recent period.

"Nature and Genesis of Batholiths" was the title of a paper presented by C. M. Nevin and Evans B. Mayo. Contrary to the generally accepted belief that batholiths are emplaced during the last stages of an orogeny, while the area is still under the influence of regional compressive stresses, they believe, after considering the isotherms, that the granite is slowly melted during the period of erosion immediately following deformation. An orogeny is genetically related to a batholith in that it determines the locus of magma formation, but the actual intrusion is distinctly later. It coincides with the great regional uplifts that affect folded areas after compression has ceased.

Charles Schuchert in a paper, "Cambrian and Ordovician Stratigraphy and Faunas of North-western Vermont," discussed the difficulties in determining the successions, faunas, and structure of that region. The determination of fossils is extremely difficult due to cleavage and fragmental conditions. The formations and faunas that have thus far been discovered in the Cambrian and early Ordovician were presented, the formations were redefined and two new ones named.

W. T. Thom, Jr., speaking on gravity observations and basement structure, pointed out that correspondence between gravity anomalies and local geologic conditions such as basement structural features has been observed in several localities and concluded that the pendulum method of observing gravity may be of greater importance to geologists and others interested in underground exploration than has generally been appreciated.

The Society of Economic Geologists held a joint meeting with the Mining Geology section of the American Institute of Mining and Metallurgical Engineers at the latter's annual New York meeting in February, 1935. Among the important papers presented were "Supergene Sphalerite, Galena and Willemite at Balmat, N. Y." by John S. Brown. He cited the downward fading of these minerals; their lateral fading from the locus of an old sink-hole; the fact that the peculiar relationships hold only at this spot in the Balmat mine and are not present in the nearby Edwards mine, and their microscopical features in support of the hypothesis that sphalerite, galena, chalcocopyrite, and magnetite have replaced primary sulphides by downward migration. Such an unusual origin for these minerals, usually considered of hypogene origin, was received with some skepticism by Profs. A. M. Bateman and L. C. Graton, who raised the question of whether they might not be due to later hypogene invasion. Dr. D. F. Hewett emphasized that in any such study the old oscillations of ground water level must also be kept in mind.

In a significant paper by W. H. Emmons "On the Origin of Certain Systems of Ore-bearing Fractures," he stated that certain types of fractures were due to expelled vapors from a cooling granite collecting near the tops of cupolas in batholiths. These vapors are believed to exert sufficient pressure to fracture the hoods and roofs of batholiths above the cupolas, and, if true, one would expect to find that the fracture systems above cupolas are arranged in patterns that depend partly on the shape of the cupola. He cited a number of ex-

amples which appeared to support his theory. The various steps involved and the effects produced by such fracturing were discussed in some detail.

"Some Fundamental Aspects of Mineralization in Tests on Absorption, Permeability and Metasomatism of Limestone" was presented by George W. Bain. He demonstrated the possibility of applying recent advances in physical chemistry to mineralogical problems by citing some of the work that had been done in the Vermont Marble deposits.

Other Papers Published During the Year. "Hydrothermal Experiments with Gold," by Stephen P. Ogryzlo, *Economic Geology*, June-July, 1935.

The experiments in this investigation on the solvent action of various substances on gold under high temperature and pressure conditions were made to imitate as closely as possible the conditions existing in nature. The experiments showed that gold may be transported either in acid or slightly alkaline aqueous solutions and also in the vapor phase as AuCl_3 . In a closed system, however, the pressure would tend to prevent volatilization of AuCl_3 . But under some conditions of reduced pressure the gold may be transported in the vapor phase. On account of the uncertain pressure factor it is difficult to place limits in the temperature at which volatilization would take place in nature.

"High-Temperature Mineral Associations at Shallow to Moderate Depth," by A. F. Buddington, *Economic Geology*, May, 1935.

The author suggests the name Xenothermal for mineral deposits formed at high temperatures and moderate to shallow depth and discusses various types of deposits which he believes belong in this classification. These include: platinum deposits of the Waterberg district in the Transvaal, Africa, and the Yellow Pine Mining District, Nevada; magnetite-apatite-pyroxene deposits of Cerro Mercado, Mexico, Barth, Nevada, and Algarrobo, Chile, cassiterite and cassiterite-wolframite deposits of the Ikuno district of Japan and Llallagua, Bolivia, molybdenite-orthoclase-quartz deposits of Climax, Colorado, scheelite deposits of the Atocha district, California; tourmaline-cherty quartz or jasperoid deposits in the Oquirrh Mountains, in the Oregon Cascades, in Panama and at Ely, Nevada; tourmaline-chalcopryrite deposits at the Braden mine, Chile, the Cactus Mine, Utah, and others.

"Spectrographic Evidence on Origin of Ores of Mississippi Valley Type," by L. C. Graton and G. A. Harcourt, *Economic Geology*, November, 1935.

As a result of spectrographic studies, it was found that quantities of the same relatively rare elements in the sphalerite of the ores of the lead-zinc deposits of the Mississippi valley compare favorably with those found in the sphalerite deposits now generally accepted as of magmatic origin.

The procedure followed in the spectrographic determinations and the results obtained are given, with a detailed discussion of the similarities and differences which occur. Additional evidence for the magmatic origin of the Mississippi valley deposits that has been presented by other writers is summarized. The authors conclude that the origin of these lead-zinc deposits has not yet been proved, although the spectrographic study adds one more line of evidence supporting the magmatic theory of origin.

"Waters, Magmatic and Meteoric," by Waldemar Lindgren, *Economic Geology*, August, 1935.

The paper gives definitions of magmatic and meteoric waters and suggests that the present tendency to minimize the quantity and importance of meteoric waters has gone too far, that meteoric water in permeable sedimentary rocks may easily reach a depth of 8000 feet and possibly 10,000 feet. In igneous and metamorphic rocks the cementation generally prevents any active penetration by surface waters below a depth of about 3000 feet. It is also thought that the present distribution and composition of the water in a body of rock may be entirely different from that prevailing at an earlier date and may have changed several times since the time when certain ore deposits were formed.

Magmatic waters are considered as a principal agency in the formation of mineral deposits, and in the case of deep-seated intrusion below the limit of moving meteoric waters, the deposits surrounding them are no doubt wholly of magmatic origin.

It is believed that the "telemagmatic" lead-zinc deposits of the Mississippi Valley and other districts in Europe were formed by mixtures of magmatic and meteoric waters, generally saline, and that they were formed at comparatively low temperatures and that they are most closely related to the epithermal deposits.

The deep waters in past periods in the Witwatersrand district are also considered and a detailed analysis made of the events prevailing during the Keweenaw in the region of the Lake Superior copper deposits. The conclusion is reached that many and important changes in the water conditions have taken place and that the deposits are the result of both magmatic and meteoric waters.

"The System, MgO-FeO-SiO_2 ," by N. L. Bowen and J. F. Schairer, *American Journal of Science*, February, 1935.

Because of the great importance of the ferromagnesian silicates as rock-forming minerals a study of the equilibrium system of MgO-FeO-SiO_2 has been made. The three series of solid solutions, the oxides, MgO-FeO ; the orthosilicate, olivine; and the metasilicate, pyroxene, were studied, as well as temperature relations and mix-crystal series.

"The Origin of the Potash-Rich Rocks," by Ruth Doggett Terzaghi, *American Journal of Science*, April, 1935.

The term "orthoclase rich" is applied to rocks whose composition lies in the orthoclase held of the feldspar equilibrium diagram. Vogt has suggested that potash and plagioclase feldspars may be in equilibrium with a liquid having a higher $\text{Or} : \text{Ab} + \text{An}$ ratio if the melt contains relatively large quantities of water, as is the case toward the end of the crystallization process. High pressure may be expected to displace equilibrium in the same sense. It is also possible that some of the potash rich rocks which appear to be of igneous origin may have been produced by metasomatic processes, chiefly by the feldspathization of quartzite and that during hydrothermal alteration and weathering of igneous rocks the potash-soda ratio may undergo a considerable increase not always accompanied by easily diagnosed changes in the appearance of the rock.

"Age of Allanite from Amherst County, Virginia, U. S. A.," by John Putnam Marble, *American Journal of Science*, October, 1935.

This paper, by a member of the Committee on Determination of Geologic Time, Division of Geology and Geography, National Research Council, gives an analysis of a specimen of fresh allanite from a pegmatite connected with hypersthene-granodiorite in Amherst County, Virginia. A "lead-ratio" of 0.111, corresponding to an age of approximately 800 million years, is in fair agreement with geological field evidence.

"Mother Lode and Sierra Nevada Batholith," by Ernst Cloos. *Journal of Geology*, April-May, 1935.

A mineralized and silicified zone which dips more gently than the wall rock and is accompanied by reverse faulting or thrusting is defined as the "mother-lode" structure. One of these occurs on the western border of the Sierra Nevada batholith. The paper discusses the region in some detail and concludes that the plunge of the batholith to the south accounts for the increase in gold values from south to north, as the highest values are believed to occur where the shallowest levels of the batholith are encountered.

"Relations of Anorthosite to Granite," by Frank F. Grout and W. W. Longley, *Journal of Geology*, February-March, 1935.

The authors believe that the difference between anorthosites of the Adirondacks and those of Minnesota are due largely to the intense deformation of the former during or after crystallization, such deformation having obscured the relations of the rocks. The conclusions reached from a study of the anorthosite and granite at Duluth are that the granitic phases of the magma seem to have evolved from a gabbro magma some time after the anorthosite was evolved. Both are related to gabbro, but not differentiated directly from each other. Gradations from granite to anorthosite originate by inclusion and reaction.

"Geologic Deductions from Earthquakes of Deep Focus," by J. S. de Lury, *Journal of Geology*, October-November, 1935.

Seismologists have established the existence of a high degree of rigidity of rocks down to great depths, but the author does not accept the commonly held view that earth-

quakes are of shallow origin and that shallow rocks alone can permit the slow accumulation of elastic stresses. He believes that growing evidence indicates that earthquakes probably originate in all levels down to depths of 700 or more kilometers and that this evidence is disturbing to the assumptions of isostasy and to those hypotheses which rest on the concept of a shell of weakness.

"Epicycles of Erosion in the Valleys of the Colorado Plateau Province," by Reed W. Bailey, *Journal of Geology*, May-June, 1935.

Recent changes in the erosion cycle of the Colorado Plateau Province are discussed and the conclusions reached that utilization of the region by man and the consequent reduction and modification in the plant cover are major factors in starting the new epicycle of erosion.

"Studies on the Zeolites." Part viii. "A Theory of the Vapor Pressure of the Zeolites, and of the Diffusion of Water or Gases in a Zeolite Crystal," by Max H. Hey, *Mineralogical Magazine*, London, September, 1935.

He proposes an equation to fit the experimental data on the behavior of zeolites on dehydration and on their capacity for absorbing other gases and vapors in place of the water removed.

New Books:

Structural Geology, by Bohuslav Stöckes and Charles Henry White (Macmillan and Co., Ltd., London, 1935). An elaboration of the work of Dr. Stöckes which was published in Czech and German. In rewriting, the text has been rearranged and expanded and the subjects and illustrations increased nearly twofold. It deals especially with the structure of Economic Mineral Deposits.

Evolution of the Congo Basin, by A. C. Veatch (Geological Society of America, Memoir 3, Judd and Detweiler, Inc., 1935). This book solves many of the problems of the Congo Basin by assembling and piecing together the great amount of data that is now available on the Congo and adjoining areas, together with the author's long experience in the region.

Limestone and Its Products, by Alfred B. Searle (Ernest Benn, Ltd., London, 1935). The first textbook to treat the subject of limestones as a whole, and especially their nature, production, and uses. Written primarily for industrialists and not geologists or mineralogists. It points out the manifold industrial uses, its products, indicates the kinds desired by some of the principal industries, and describes the modes of preparation as well as the properties required in order that various products may be suitable for the numerous purposes for which they can be employed.

Sahara, the Great Desert, by E. F. Gautier, translated by Dorothy Ford Mayhew (Columbia University Press, New York, 1935). A translation from the 2nd French edition, *Le Sahara*, (Payot, Paris, 1928) and from hitherto unpublished material supplied by the author, with additional drawings and a map by Paul Laune. The original was hailed as a geographical classic. The translation contains a new conclusion, giving a vivid picture of present day Sahara. It also contains a good picture of the geological history of the region.

The Solar System and Its Origin, by Henry Norris Russell (The Macmillan Co., New York, 1935). A series of lectures given at the University of Virginia on the Page Barbour Foundation in 1934. It is a general presentation of the present state of knowledge and theory and not a technical contribution to cosmogony.

The Changing World of the Ice Age, by Reginald Aldworth Daly (Yale University Press, New Haven, Conn., 1934); Humphrey Milford, Oxford University Press, London). A summary of the work and thought of the author on the problem of sea level during Pleistocene, as well as the implications that arise as to earth dynamics and stability and related problems.

Geology of Natural Gas, A Symposium, by Henry A. Ley (American Association of Petroleum Geologists, Tulsa, Oklahoma; Thomas Murry and Co., London, 1935). The geology of the most important known occurrences of natural gas on the North American Continent, methods of estimating natural gas reserves and resumé of the industry. Indispensable to all geologists engaged professionally in this field.

Tectonic Essays, Mainly Alpine, by E. B. Bailey (Clarendon Press, Oxford, 1935). An important work summarizing the discoveries of tectonic structure of the Alps. *Géologie Appliquée*, by E. Raguin (Masson et Cie., Paris, 1934). A brief, concise outline of the fundamental principles of geology and their practical application. Largely for those employed in fields in which geologic problems arise and to beginning students of applied geology.

Invertebrate Paleontology, by William H. Twenhofel and Robert R. Shrock (McGraw-Hill Book Co., Inc., New

York and London, 1935). A textbook in which the subject matter is adapted to the needs of the beginning student. Each invertebrate phylum is treated with about the same completeness, explaining the relations between skeletal parts and soft tissues, the environment and their proper place in the evolution of organic development.

Historical Geology of the Antillean-Caribbean Region, by Charles Schuchert (John Wiley and Sons, Inc., New York; Chapman and Hall, Ltd., London, 1935). A first attempt to bring together the geologic history of the Antillean-Caribbean region. It contains a summary of all work done in the region, an extensive bibliography, and many paleogeographic maps.

A Monograph of the Echinoidae II, by Th. Mortensen (Copenhagen, 1935). It deals with the fundamentals of the taxonomy of the echinoids and in many respects departs widely from the scheme of classification now current among paleontologists.

On Several Archaean Rocks from the South Coast of Norway, II, The South Norwegian Hyperites and Their Metamorphism, by W. C. Brugger (I. Kommissjon Hos Jacob Dyrbywad, Oslo, 1935). An exhaustive study of the hyperites from the Kragerø region and their different stages of metamorphism, to "Coronites" to "hornblende-gabbros" and to amphibolitic rocks as well as into different scapolite-bearing rocks.

GEORGETOWN UNIVERSITY. A Roman Catholic institution of higher education for men in Washington, D. C., founded in 1789, and conducted by the Society of Jesus. In the autumn of 1935, 2197 students were enrolled. The faculty numbered 456. The libraries contained 219,903 volumes. President, the Rev. Arthur A. O'Leary, S.J., Ph.D., D.D.

GEORGE WASHINGTON UNIVERSITY. THE. A nonsectarian institution of higher learning for men and women in Washington, D. C., founded in 1821. The enrollment for the first semester of 1935-36 was 6159. The enrollment in the 1935 summer session was 1375. The faculty numbered 359. A new science hall was opened in the fall, and a women's residence hall, the gift to the University of Mrs. Henry Alvah Strong, was under construction. In further development of the programme in theoretical physics inaugurated last year, Dr. Edward Teller, Hungarian physico-chemist, was this year appointed Visiting Professor, Dr. George Gamow, formerly of the Institute of Science at Leningrad, was made a member of the resident faculty. The total endowment amounted to \$2,249,428, from which the income for 1934-35 was \$60,352. The total income from all sources was \$1,246,748. The library contained more than 108,000 volumes. President, Cloyd Heck Marvin, Ph.D., LL.D.

GEORGIA. Population. On Apr. 1, 1930 (Fifteenth Census), 2,908,506; on July 1, 1934, by latest Federal estimate, 2,911,000; 1920 (Census), 2,895,832. Atlanta, the capital, had (1930) 270,366 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu.	Value
Cotton	1935	2,177,000	1,060,000 ^a	\$58,035,000
	1934	2,103,000	968,000 ^a	58,656,000
Corn	1935	4,045,000	44,495,000	26,697,000
	1934	3,927,000	39,270,000	32,987,000
Peanuts	1935	789,000	552,300,000 ^b	17,674,000
	1934	779,000	467,400,000 ^b	14,957,000
Tobacco	1935	72,000	68,053,000 ^b	12,923,000
	1934	51,600	31,951,000 ^b	6,107,000
Hay (tame)	1935	801,000	451,000 ^c	4,961,000
	1934	773,000	414,000 ^c	5,589,000
Peaches	1935	...	5,628,000	4,784,000
	1934	...	5,610,000	4,488,000
Sweet potatoes .	1935	89,000	8,010,000	6,408,000
	1934	89,000	7,120,000	6,266,000
Oats	1935	356,000	7,298,000	4,233,000
	1934	336,000	6,384,000	4,533,000
Potatoes	1935	21,000	1,365,000	1,024,000
	1934	20,000	1,360,000	1,306,000

^a Bales. ^b Pounds. ^c Tons.

Education. The number of persons of school age inhabiting the State was reckoned, for the academic year 1934-35, as 867,727. Pupils enrolled in the public schools numbered 764,865. Of these, 656,940 were in common schools or elementary grades, and 107,925 were in high schools. The expenditures of the previous year, 1933-34, for public-school education in the State totaled \$16,078,502. The salaries of teachers averaged \$695.69 by the year. The State made payments to the public schools in 1935 to the extraordinary total of some \$9,000,000; this included the discharge of unpaid State aid for the years 1929-31, as reported by the *Journal* of the National Education Association.

Charities and Corrections. Control of the eleemosynary institutions of the State was exercised in 1935 by a Board of Control of Eleemosynary Institutions, which had been set up in 1932. Its 12 members were: the Governor, *ex officio*, one member for the State at large, and one to represent each of the State's Congressional districts. Under the authority of this board a Department of Public Welfare supervised county jails and almshouses and private institutions for the care of children and other dependents and performed duties in connection with the work of the juvenile courts.

The State institutions under the Board of Control were: Milledgeville State Hospital (mental cases), at Milledgeville; State Tuberculosis Sanatorium, at Alto; Georgia Training School for Mental Defectives, Gracewood; for juvenile correction, the Georgia Training School for Boys, at Milledgeville, and Georgia Training School for Girls, at Atlanta; Georgia School for the Deaf, Cave Spring; Georgia Academy for the Blind, Macon; Confederate Soldiers' Home, Atlanta.

Legislation. An act was passed to submit to a referendum the questions: whether the people favored repealing the prohibition of liquors, whether they wished repeal as to beer and whether they wanted it as to wines. With regard to legislation to bring the State into conformity with schemes of the Federal "New Deal," Governor Talmadge's hostility to the Federal programme acted as a check. He vetoed a measure to submit to the popular vote a proposal to amend the State constitution so as to allow the payment of pensions to persons over the age of 65 years. He also vetoed a bill to validate the sale of the State's highway certificates to the Federal Government, which Administrator Ickes of the PWA had demanded as a prerequisite to loans from that organization. A law was passed to authorize the sexual sterilization of persons in the State's institutions, as designated by a board of eugenics. On the invitation of the lower house, Huey Long of Louisiana visited that body on February 5 and spoke on his "share the wealth" scheme of redistribution of incomes.

Political and Other Events. The popular vote taken on May 15 in a referendum on the proposed repeal of State prohibition of alcoholic beverages gave on the unofficial count a slender majority of 227 votes against repeal as to distilled liquors, out of a total vote of some 164,000; repeal as to beer and wines was carried. The official count, which followed, was contested in the courts, the opponents of repeal seeking to prevent the certification of the vote in three counties. The State Supreme Court ruled in October that the vote had repealed the State's prohibition laws.

The State's law of 1866 against sedition, a relic of the early days of Reconstruction, was invoked against a Negro, Angelo Herndon, accused of Communist activity. After he had been convicted

under this law and sentenced to 20 years of prison, the Superior Court of Fulton County, on his appeal, held the old law unconstitutional, December 7, and freed him on bail.

Upon Governor Talmadge's vetoing a bill to validate the State's sale of highway obligations to the Federal Government, Administrator Ickes withdrew on April 18 intended loans from the PWA to the State. Administrator Hopkins of the FERA ousted State agents from the control of Federal aid to the indigent unemployed on April 19, and put the task in Federal hands. The funds for this aid had come from the Federal Treasury in 1934 to the extent of 95.5 per cent, the State making no contribution and the subdivisions relatively little. Postmaster-General Farley threatened to exclude from the second-class mails, on June 13, the market bulletin of the State's department of agriculture, which had published matter adverse to the Federal Administration and thereby allegedly impaired its right to the second-class mail as an agricultural periodical.

The hostile acts of the Federal Administration were preceded and accompanied by attacks upon it, delivered by Governor Talmadge. He attacked the processing tax on cotton on April 16: a tax apparently popular with the majority of the farmers of his own State. On the 22d he declared his opposition to the renomination of President Roosevelt; in later speeches and statements he carried on a general and bitter criticism of the course of the Federal Government.

A strike at the Callaway cotton mills, opposed by some of the employees, who petitioned for the protection of troops, led Governor Talmadge on March 4 to send seven companies of the National Guard to Manchester and La Grange to protect the mills.

Officers. The chief officers of the State, serving in 1935, were: Governor, Eugene Talmadge; Secretary of State, John B. Wilson; Attorney-General, M. J. Yeomans; Treasurer, George B. Hamilton; Auditor, Tom Wisdom; Comptroller, William B. Harrison; Superintendent of Schools, M. D. Collins; Commissioner of Agriculture, Tom Linder; Commissioner of Commerce and Labor, H. M. Stanley.

Judiciary. Supreme Court: Chief Justice, Richard B. Russell; Assistant Justices, John B. Hutcheson, R. C. Bell, Marcus W. Beck, Samuel C. Atkinson, S. Price Gilbert.

GEORGIA, UNIVERSITY OF. A State institution of higher education for men and women in Athens, Ga., chartered in 1785. The enrollment in the 1935 summer session was 1761 and for the autumn term 2733. The faculty numbered 155. The productive funds amounted to \$425,000. The library contained 101,000 volumes. The Georgia State College of Agriculture and the Mechanic Arts and the Georgia State Teachers College have been integrated with the university, all three institutions constituting the University of Georgia. President, H. W. Caldwell, L.L.D.

GEORGIAN SOVIET SOCIALIST REPUBLIC. A republic of the Transcaucasian S.F.S.R. of the Soviet Union. It includes the Abkhassian Soviet Socialist Republic, the Ajaristan Autonomous Soviet Socialist Republic, and the South Ossetia Autonomous Region. Area, 26,981 sq. miles; population (1933), 3,110,600. Tiflis, the capital, had 414,000 inhabitants; Kutais, 57,646; Poti, 15,782; Samtredi, 15,120; Stalinissi, 13,386; Telav, 10,050.

Production. The area under cultivation totaled

2,273,635 acres of which 86,450 acres were under tea. By Jan. 1, 1933, 36.6 per cent of the farms had been collectivized. The forest lands contained many rich varieties of timber. Manganese mining was the most important industry—the deposits were estimated at 250,000,000 tons. During 1933 the output of tea amounted to 748,000 kilograms. In 1933 the gross production of Georgian industry was valued at 250,000,000 rubles (ruble was valued at \$0.5146 in the U.S.S.R.). Railway lines extended 570 miles.

GEORGIA SCHOOL OF TECHNOLOGY. An institution for the scientific and technical education of men in Atlanta, Ga., founded in 1888. The enrollment for the autumn of 1935 was 1864, while that in the summer session was 328. The faculty numbered 154. The endowment amounted to \$431,000, and the income from appropriations and fees was \$509,876. There were 33,564 volumes in the library. President, Marion Luther Brittain, LL.D.

GERMAN LITERATURE. Statistics indicate that the output of German publishing firms was considerably larger in 1935 than during the two years previous, while the sale of newspapers and periodicals declined. Though the gain is attributable primarily to the growing importance of propagandistic literature, allowance must be duly made for a heightened interest in *belles lettres* and imaginative literature. Government surveillance was exercised in accordance with National Socialist principles. The list of authors living in exile received important additions. Vienna, Zurich, Amsterdam and even Paris became important German publishing centres. Books issued in these cities are included in the following survey.

Novels. Fiction offering biography in disguise was in fashion. Friedrich Schreyvogel's *Grillparzer* and Wolfgang Goetz's *Der Mönch von Heisterbach* are representative instances. Bach is the subject of *Gottes Orgel*, by Kurt Arnold Findeisen; Haendel is the hero of Ernst Wurm's *Seine Kraft war in ihm mächtig*; Andreas Hofer inspired Erwin H. Rainalter's *Der Sandwirt*; and the establishment of the trans-Atlantic cable furnished the idea for Hans Heuer's *Cyrus Field erobert die Welt*. The historical novel—e.g., Otto von Taube's *Die Metzgerpost*, and Kurt Eggers' *Herz im Osten*—seemed to retain much of its popularity. Regional fiction included *Die Schenke zur ewigen Liebe*, by Walther Vollmer; *Der Zwingherr*, by Peter Dörfler; and *Das Schutzengelhaus*, by Richard Billinger. Literature of "blood and soil"—for which German critics have found the term "Blubo"—is typified by Hein Kruse's *Der Gefallene ruft*. Among the novels by better known authors are: Otto Flake's *Anselm und Verena*; Enrica von Handel-Marzett's *Die Waxenbergerin*; Ruth Schaumann's *Der Major*; Clara Viebig's *Der Vielgeliebte und die Vielgehasste*; Jakob Schaffner's *Larissa*; Ernst Zahn's *Der Weg hinauf*; Vicki Baum's *Das grosse 1×1*; and Josef Ponten's *Die Väter zogen aus*. A selection from other published fiction includes: Kurt Schubert's *Märten von Borwiz*; Mechtilde Lichnowsky's *Delaide*; Carl Haensel's *Echo des Herzens*; Alexander Castell's *Begegnung mit einem bösen Tier*; Siegfried Trebitsch's *Helmkehr zum Ich*; Georg Rendl's *Wartendes Land*; Emil Strauss's *Der Riesenspielzeug*; Hans Gumprecht's *Der Baum der Erkenntnis*; Fanny Wibmer-Pedit's *Ritter Florian Waldauf*; Juliana von Stockhausen's *Paul und Nanna*; Thomas Quint's *Der Weg nach Haus*; Elizabeth Langgasser *Der Gang durch das Ried*.

Shorter Fiction. Not a few veteran literary artists profess to believe that the novel is not des-

tined to retain its preëminence as a form of expression. It seems improbable, however, that the *Novelle* will ever lose its charm for German readers, though it appears often to baffle translation into other languages. The finest work of the past year—less fruitful than some—includes Hermann Hesse's *Fabulierbuch* and Ernst Eichert's *Hirtennovelle*. Hans Grimm, one of the most popular German fiction writers, is represented by a characteristic story, *Luderitzland*. Jakob Kneip has published *Hunsrückweihnacht*; Anton Galiele is the author of *Mitsommer*.

Drama and Poetry. Mediocre political dramas testified to the low estate to which the German theatre has fallen. The *Schiller Preis* was not awarded during 1935. Jewish actors were constrained to perform only for their own cultural community, and their achievement cannot be recorded here. Among the plays having some literary merit the following were notable: Max Mell's *Das Spiel von den deutschen Ahnen*; Josef Buchhorn's *Heinrich von Kleist*; and Friedrich Wolf's *Florisdorf*. Lyric verse was comparatively plentiful. Hermann Stehr's beautiful *Lebensbuch* and Alexander Lernet-Halenia's distinguished *Die goldene Horde* possibly head the list. Will Vesper issued his collected poems under the title, *Kranz des Lebens*. Richard Billinger's latest volume is *Nachtwache*. Josef Weinheber's *Adel und Untergang*, Edward Stucken's *Die Insel Perditia*; Johannes Linke's *Der Baum*, and Karl Rauch's *Feldgraue Ernte* all attracted attention. Hans Arens edited an anthology, *Frühe deutsche Lyrik*. The year provided numerous excellent versions of classical poets, notably Dante and Pindar. Nothing impressive was introduced in the realm of musical drama.

Politics and Economics. Solid treatises in the social sciences were few in number, attention being given rather to political issues interpreted varying by writers living inside and outside Germany. Eugen Diesel's *Ring um Europa* is a sequence of essays by an intelligent observer. Peter Dehen's *Sinn und Ende der Arbeitslosigkeit* offers a new theory of technological unemployment. *Kurzgefasste Volkswirtschaftslehre* and *Volkswirtschaftslehre* are the latest works of Adolf Weber. The most important international development of 1935 forms the topic of Fritz Klein's *Warum Krieg um Absinien?* A prominent Nazi exile, Otto Strasser, recounted his experiences in *Die deutsche Bartholomäusnacht*. Georgi Dimitroff's *Aufzeichnungen* form a noteworthy addendum to Communist literature. Otto Meissner and Georg Kaisenberg issued a study of newer German law, *Staats- und Verwaltungsrecht im Dritten Reich*. Other literature pro and contra includes August Winnig's *Heimkehr*; Emil Meyren's *Deutschland und deutsches Reich*; Adolf Spamer's *Die deutsche Volkskunde*; and Waldemar Gurian's *Bolschewismus als Weltgefahr*. Carl Hensel and Richard Strahl supply an *Aussenpolitisches ABC*. The following treatises concern themselves with more philosophical aspects of the modern German state: Hans Heyse's *Idee und Existenz*; Ernst Zenker's *Religion und Kult der Urarier*; Walther Pembaur's *Nationalismus und Ethik*; and Werner Sombart's *Deutscher Sozialismus im Urteil der Presse*. A considerable number of brochures dealt with problems incidental to rearmament and military training.

Biography. An unusually large number of good biographies have appeared. Perhaps existing social conditions have inculcated regard for personalities as the instruments of historical destiny, or perhaps a taste for reality as distinguished from fiction has

Schulte, records a missionary's aeroplane voyage in Africa.

General Works. The new encyclopedias were brought to completion:—*Der grosse Herder* and *Das kluge Alphabet*, both of which feature modern book-making technique. The *Handbuch der Kulturgeschichte*, which H. Kindermann is editing, was enriched by a section dealing with aspects of the 18th century, by Emil Ermatinger. *Ekklesia*, the projected compendium of Christian faiths, had added a study of the Scandinavian churches. *Die Deutsche Literatur in Entwicklungsreihen* now includes two studies of literature in the baroque period.

Translation. Generous attention was accorded books translated from other languages. Two notable fiction successes, Hervey Allen's *Anthony Adverse* and James Hilton's *Goodbye, Mr. Chips*, were made available to German readers. Emmet Lavry's *First Legion* was successful in Viennese and other theatres. Other authors introduced to the German public include Pearl Buck and Kristmann Gudmonson. Critics gave more than usual notice to Polish books. High praise was accorded Nora Wain's *House of Exile*.

GERMANY. A former federal republic, transformed into a unified and centralized state by the National Socialist revolution commencing in 1933 Capital, Berlin.

Area and Population. The area and population of Germany at the censuses of 1925 and 1933, by the former constituent republics, are shown in the accompanying table.

GERMANY: AREA AND POPULATION BY STATES

States	Area, English sq miles	Population, June 16, 1925	Population, June 10, 1933
Prussia ^a	113,042	38,175,989	39,861,360
Bavaria	29,343	7,379,594	7,684,645
Saxony	5,787	4,994,281	5,196,531
Württemberg	7,532	2,580,235	2,695,942
Baden	5,819	2,312,462	2,413,324
Thuringia	4,541	1,607,339	1,659,510
Hesse	2,970	1,347,279	1,426,847
Hamburg	160	1,152,523	1,214,097
Mecklenburg ^b	6,199	784,314	805,189
Oldenburg	2,481	545,172	574,471
Brunswick	1,419	501,875	512,868
Anhalt	893	351,045	364,371
Bremen	99	338,846	371,951
Lippe	469	163,648	175,520
Lubeck	115	127,971	136,403
Schaumburg-Lippe	131	48,046	50,023
Total ^c	181,000	62,410,619	65,143,052

^a Including Waldeck. ^b Mecklenburg-Schwerin and Mecklenburg-Strelitz were united Jan 1, 1934 ^c Excluding the Saar (area, 738 square miles, population, 826,000 in 1933), which was restored to Germany Mar. 1, 1935.

The estimated population on Jan. 1, 1935, was 65,804,000. Living births in 1934 numbered 1,181,179 (956,974 in 1933), deaths, 716,865 (729,501); marriages, 731,431 (631,152). There was an unprecedented movement of population within Germany during 1934. A total of 1,790,000 persons moved from smaller communities to cities of over 50,000 population, while another 1,870,000 moved from large cities to rural districts. The cities of more than 100,000 population received 1,430,000 new residents in 1934 but lost 1,510,000 others. The population of Berlin declined from 4,242,501 at the census of June 16, 1933, to 4,241,000 (estimated) on Jan. 1, 1935. Populations of other leading German cities in 1933 were: Hamburg, 1,129,307; Cologne, 756,605; Munich, 735,388; Leipzig, 713,470; Essen, 654,461; Dresden, 642,143; Breslau, 625,198; Frankfurt-on-Main, 555,857; Dortmund,

540,875; Düsseldorf, 498,600; Hanover, 443,920; Duisburg-Hamborn, 440,419; Stuttgart, 415,028; Nuremberg, 410,438; Wuppertal, 408,602. According to the 1933 census, Protestants comprised 62.7 per cent of the population, Catholics 32.5 per cent, Jews 0.7 per cent, adherents of other religions 4 per cent.

Education. Education is compulsory and the number of illiterates is negligible. Enrollment in elementary schools in 1931-32 was 7,590,073; in intermediate schools, 229,671; in vocational and trade schools, 1,752,941; in "gymnasien" and "realschulen," 786,691; in universities and advanced technical schools (1933-34), 99,304 and 20,936, respectively. The Hitler régime adopted the policy of drastically curtailing the number of students in universities and advanced technical institutions. The combined enrollment in the 23 universities was about 55,000 in the 1935 summer session (approximately 100,000 in the 1932 summer session) and the enrollment in the ten technical high schools was about 22,000 in 1935 (about 30,000 in 1932). The number of new students enrolled in the universities in the summer of 1932 was 20,000; in 1935, about 7000.

Agriculture, etc. Germany in 1934 had 50,438,000 acres of arable land, 20,199,000 acres of meadow and pasture, 1,881,000 acres of shrubs and orchards, and 31,630,000 acres of forests. The area and production of the chief crops in 1933 and 1934 is shown in the accompanying table from the U.S. *Foreign Commerce Yearbook, 1935*.

GERMAN CROPS: AREA AND PRODUCTION

Crop	Area ^a		Production ^b	
	1933	1934	1933	1934
Wheat	5,727	5,431	205,918	166,539
Rye	11,180	11,097	343,576	299,501
Barley	3,918	4,030	159,292	147,156
Oats	7,864	7,773	478,986	375,634
Spelt	280	257	5,898	5,271
Potatoes	7,139	7,183	1,619,320	1,718,865
Sugar beets	686	859	8,579 ^c	10,394 ^c
Beet sugar ^d			1,432 ^e	1,656 ^e
Fodder beets	2,043	2,088	30,717 ^c	33,805 ^c
Hay, alfalfa, and clover	18,647	18,508	32,836 ^c	26,424 ^c
Hops	24	24	14,977 ^c	14,427 ^c
Tobacco	30	30	64,890 ^c	66,358 ^c
Grapevines	178	180	47,512 ^f	119,533 ^f

^a Thousands of acres. ^b Thousands of units—bushels, except as indicated. ^c Unit, metric ton. ^d Seasons ended following year. ^e Unit, pound. ^f Unit, gallon of wine.

Livestock statistics for 1934, with the averages for 1921-25 in parentheses, were (in thousands): Cattle, 19,165 (16,877); sheep, 3482 (5610); horses, 3374 (3790); swine, 23,125 (16,192); goats, 2489 (4261). The value of meat and other livestock products in 1934-35 was estimated at 6,187,000,000 reichsmarks. The value of crops produced in the fiscal year 1934-35 was (in millions of reichsmarks): Wheat and spelt, 774; rye, 709; barley, 269; oats, 90; potatoes, 730; beet sugar, 589; hops, 36; tobacco, 35; grapevines, 183. Sea fisheries in 1933 produced 409,000 metric tons of fish, valued at 62,300,000 reichsmarks.

Mining and Manufacturing. The mineral and metallurgical production of Germany in 1934, with 1933 figures in parentheses, was (in 1000 metric tons): Coal, 125,011 (109,921); lignite, 127,257 (126,795); coke, 24,219 (21,154); briquets, 36,238 (34,929); iron ore, 4680 (2592); lead (smelter), 120 (116.6); copper (smelter), 52.6 (49.8); potash (K₂O), 1220 (1026); pig iron, 8742 (5266); crude steel, 11,886 (7585); rolling-mill products, 8403 (5460). Rayon output in 1934 was about 81,570,000 lb. (72,311,000 in 1933); shipping tonnage

launched, 73,733 gross tons (42,195 in 1933). Net imports of raw cotton, including linters, were 881,000,000 lb. in 1934 and 1,043,000,000 lb. in 1933.

The 1935 output of pig iron and ferro-alloys, including the Saar after March 1, was 12,530,000 metric tons; steel ingots and castings, 16,104,000 metric tons; coal, 143,016,000 metric tons.

The value of mineral and industrial production in 1933 was (in million reichsmarks): Coal, 1169; lignite, 316; coke, 316; coal briquets, 79; lignite briquets, 310; iron ore, 21; lead, 4; copper, 13; potash, 120; pig iron, 282; crude steel, 566; rolling-mill products, 879; rayon, 139 (sales only). According to the industrial census of 1933, 8,999,000 persons were employed in mining and manufacturing, compared with 10,871,000 in 1925. There were 1,897,929 industrial establishments, the chief lines being iron and steel, chemicals, textiles, beet sugar, potash, glass, porcelain, earthenware, electrical goods, beer, tobacco products, toys, musical instruments, footwear, etc. For economic conditions in 1935, see *History*.

Foreign Trade. The trend of German foreign trade during the period 1929 to 1935 is shown in the accompanying table.

GERMAN FOREIGN TRADE, 1929-35

Year	Imports for consumption		Exports of German products		Excess of imports (—) or exports (+)
	value ^a	weight ^b	value ^a	weight ^b	
1929 . . .	13,447	65,724	13,483	68,283 ^c	+ 36
1930	10,393	56,052	12,036	62,576 ^c	+1,643
1931	6,727	40,136	9,599	56,391 ^c	+2,872
1932	4,666	32,624	5,739	42,237	+1,073
1933	4,204	34,834	4,871	41,172	+ 667
1934	4,451	43,709	4,167	44,504	— 284
1935	4,159	.	4,270	+ 111

^a Millions of reichsmarks ^b Thousands of long tons
^c Inclusive of deliveries on account of reparations

Of the total German imports for consumption the United States supplied 8.4 per cent in 1934 (11.5 per cent in 1933); the Netherlands, 5.9 (5.5); the Soviet Union, 4.7 (4.6); United Kingdom, 4.6 (5.7); France, 4 (4.4); and Czechoslovakia, 3.6 (2.9). The Netherlands purchased 11.6 per cent of the 1934 exports (12.7 in 1933), United Kingdom, 9.2 (8.3); France, 6.8 (8.1); United States, 3.8 (5.0); Czechoslovakia, 3.6 (3.3).

The value of the principal 1934 imports was (in 1000 old U. S. gold dollars): Raw or washed wool, 60,596; fruits and nuts, 59,463; cotton linters, 57,139; oilseeds, 52,378; iron and steel, 50,727; chemicals and allied products, 36,648; mineral oils, 32,599; timber and lumber, 32,065. The value of the leading exports of German products for 1934 was (in 1000 old U. S. gold dollars): Iron and steel, 143,934; machinery other than electric, 102,696; chemicals and drugs, 100,265; coal, coke, and briquets, 77,731; paints and varnishes, 49,069; electric machinery, 47,413.

United States figures for 1935 showed imports from Germany of \$77,741,474 (\$68,805,488 in 1934) and exports to Germany of \$91,662,317 (\$108,738,464 in 1934).

Finance. Actual returns for the Reich's ordinary budget covering the year ended Mar. 31, 1935, showed receipts of 7,806,500,000 reichsmarks, including loans of 1,040,900,000 reichsmarks, and expenditures of 8,220,900,000 reichsmarks. The deficit totaled 1,119,000,000 marks, taking credit operations into account. For 1933-34 receipts and expenditures were 6,024,000,000 reichsmarks (including loans of 92,000,000) and 6,270,000,000 reichsmarks, respectively. For 1932-33 they were

7,377,000,000 and 7,940,000,000 reichsmarks, respectively. The ordinary budget returns for 1933-34 and 1934-35 give only a partial picture of the financial situation, as no complete official figures were available covering the extraordinary receipts and expenditures, including heavy expenditures for rearmament and reemployment.

According to the Minister of Finance, the Reich public debt on July 1, 1935, amounted to 13,200,000,000 reichsmarks, as against 12,200,000,000 reichsmarks on Jan. 1, 1933. The long-term debt on July 1, 1935, was 10,300,000,000 and the short-term debt 2,900,000,000 reichsmarks. The Minister said that there were approximately 5,000,000,000 reichsmarks of outstanding obligations not included in the 13,200,000,000 total, representing chiefly employment bills and other short-term Treasury paper used to finance employment and national defense projects. The reichsmark had a par value of \$0.2382 prior to the devaluation of the dollar in January, 1934, and a par value of \$0.4033 after that. The average exchange value was \$0.2375 in 1932, \$0.3052 in 1933, \$0.3938 in 1934, and \$0.4026 in 1935.

Communications. The German state railway system in 1933 had 33,486 miles of line and private lines about 2800 miles. During 1933 the state lines carried 1,240,000,000 passengers and 308,100,000 metric tons of freight, earning gross receipts of 2,921,000,000 reichsmarks. Comparative figures for 1929 were: Passengers, 1,980,000,000; freight, 485,900,000 metric tons; gross receipts, 5,354,000,000 reichsmarks. In 1932 highways extended about 217,500 miles. An additional 1252 miles of highway were under construction in 1935. Civil aeroplanes in 1934 flew about 8,078,000 miles and carried 130,000 passengers. The German merchant marine on June 30, 1935, had a gross tonnage of 3,703,700 (3,691,000 on June 30, 1934). The net tonnage of vessels entering German ports with cargo in 1934 was 22,896,000 (24,516,000 in 1933).

Government. While the Weimar (republican) Constitution of Aug. 11, 1919, was not formally abrogated under the Nazi régime, it was nullified by the Enabling Act of Mar. 24, 1933, by which the Reichstag authorized the Cabinet to legislate by decree even if such legislation was not in accord with the Weimar Constitution. Under the Enabling Act, Adolf Hitler established a personal dictatorship, substituting the so-called "leadership principle" for the democratic and liberal governmental system of the former republic. All activities of the country were placed under the control and guidance of Herr Hitler, acting in the dual capacity of Chancellor and head of the National Socialist (Nazi) Party. Upon the death of President von Hindenburg on Aug. 2, 1934, Chancellor Hitler assumed the functions of both Chancellor and President, under the title of Leader (Fuehrer) and Chancellor (Reichskanzler). As Leader and Chancellor, Hitler was commander-in-chief of the army, appointed all officials of both the government and the Nazi party, and exercised in conjunction with the cabinet unlimited powers of legislation. The Reichstag retained advisory powers only. The dictator during 1933 and 1934 established the precedent of submitting important questions to a national referendum. The rights of the former Federal States were abolished by the decree of Feb. 1, 1934, and the Reich Cabinet assumed full powers over State and local activities. All political parties were dissolved, with the exception of the National Socialist Party, and the formation of new political organizations was prohibited.

The members of Herr Hitler's Cabinet, formed Jan. 30, 1933, were, at the beginning of 1935: Minister of Interior, Dr. Wilhelm Frick; Foreign Affairs, Count Konstantin von Neurath; Defense, Gen. Werner von Blomberg; Finance, Count Ludwig Schwerin von Krosigk; Food and Agriculture, Dr. Walther Darré; Economic Affairs, Dr. Hjalmar Schacht (appointed Aug. 2, 1934); Labor, Franz Seldte; Communications and Posts, Baron Paul von Eltz-Rübenach; Justice, Dr. Franz Gurtner; Learning and Education, Dr. Bernhard Rust; National Enlightenment and Propaganda, Dr. Joseph Goebbels; Ministers without Portfolio, Rudolf Hess, Hans Kerrl, and Dr. Hans Frank (appointed Dec. 19, 1934).

HISTORY

Greatly strengthened by his striking successes in the field of diplomacy and by his audacious strokes at the "chains" placed upon Germany by the Versailles Treaty, Chancellor Hitler and his Nazi cohorts emerged from the eventful year 1935 more firmly entrenched in power than ever before. The authoritarian state had extended its sway into new fields. The campaign to liquidate the Jews as a factor in German national life had been carried steadily forward. Unemployment had been further reduced. The temporary stimulus to economic activity provided by the rearmament and public works programmes, combined with the national pride and enthusiasm aroused by the restoration of conscription, had calmed somewhat unrest due to economic causes.

Yet the prospects of National Socialist Germany were not entirely favorable. The economic and financial situation at the end of 1935 aroused grave forebodings in German business circles. The anti-Jewish measures provoked repercussions at home and abroad which added to the Reich's economic difficulties. The stubborn opposition of sections of the Protestant and Catholic churches to Nazi efforts at "coordination" of religion with the state afforded a rallying ground for all non-Nazi elements. Serious conflicts persisted between the army and the Nazi party over control of the new state and between radical and conservative elements within the National Socialist ranks over the form and extent of economic reorganization of the Reich. These fundamental cleavages, repeatedly evidenced in mild form during the year, threatened to precipitate at any time a serious internal crisis similar to that which produced Hitler's "blood purge" of June, 1934.

Nazi Control Extended. Commencing with the decree of January 1 amalgamating the Ministries of Justice in the several States with the Reich Ministry of Justice, the Hitler régime steadily extended its centralized control over previously uncoordinated spheres of activity. The decree of January 1 gave the Reich a unified system of legal procedure and law courts. A law of January 30 brought all local governments, municipalities, and villages under direct Nazi supervision. It provided that a Nazi representative approved by Rudolf Hess, Hitler's deputy in charge of the party, should be attached to every mayor's office, with the right of participating in all deliberations. Early in the month Dr. Wilhelm Frick, the Minister of Interior, also announced that effective January 30 the existing States would be abolished and replaced by 22 administrative districts or Provinces, with appointive governors. By eliminating local sectionalism and traditions, this step was calculated to unify the nation more closely and ex-

tend the authority of the central government. However, the annual celebration of Hitler's accession to power at which this transformation was to take place was called off for unexplained reasons and up to the end of the year Dr. Frick's proposals had not been put into effect.

The restoration of conscription, announced by Chancellor Hitler on March 16, and the accompanying provision for compulsory service in the labor camps, were considered important steps towards the welding of German unity under Nazi dominance. On April 25 new decrees aimed at the non-Nazi press, and particularly at non-Aryan newspaper owners, tended to give the official Nazi organs a monopoly of the newspaper business. Nazi control over industry and labor was solidified by the nation-wide elections which took place on May 1 in industrial and business establishments. Councils to represent the workers in their relations with the managers or "leaders" were chosen from lists approved by the Nazi Labor Front.

The aristocratic student fraternities in the universities were the next to undergo "liquidation." They had not shown proper respect for the Nazi régime, even going so far as to discuss in humorous vein the question of whether Hitler ate asparagus with fork or fingers. On October 18 the last of the fraternities was formally dissolved. The remnants of the once powerful Stahlhelm, an organization of World War veterans which formerly constituted a serious rival to the National Socialist party, was dissolved by a decree of November 7. Meanwhile the dissolution of smaller and less spectacular non-Nazi organizations proceeded on a large scale.

Protestant Opposition. It was in the effort to "coördinate" the churches that the Nazis met their chief setback. The conflict between the state and the churches, which had been almost continuous since the establishment of the Nazi régime in January, 1933, assumed a more violent form in 1935. After several months of relative quiescence, the conflict between the official Reich Church under Bishop Ludwig Mueller and the Protestant Opposition pastors broke out again in March. The Opposition pastors issued a vigorous manifesto denouncing the officially inspired German Christian movement and even the totalitarian state. They declared the Nazi creed based on "a racial and nationalistic view of life" constituted a "deadly danger." The manifesto was read from numerous pulpits despite objections of the secret police and a reduction of the churches' share of the tax in Prussia. On March 17 some 700 pastors were placed under temporary arrest in their homes to prevent them from reading the proclamation.

Further friction led Reich Minister of Interior Frick, who had been entrusted by Hitler with the task of "supervising the church conflict" to establish on June 26 a committee to settle legal disputes arising out of the religious quarrel. It was empowered to decide "whether the measures taken in the Evangelical Church since May 1, 1933, are legal or illegal." This was designed to block legal suits for damages by suspended pastors and church officials, many of whom had won their cases.

On July 18 Hitler indirectly eliminated Reich Bishop Mueller as the centre of the Protestant church controversy by appointing Hans Kerrl as Reich Minister for Church Affairs, with complete authority over both Protestant and Catholic churches. Meanwhile the indignation of Protestants and Catholics alike had been roused to a higher

pitch by the semi-official support given the pagan German Faith Movement at a time when rallies and public religious discussions by Lutherans and Catholics were discouraged if not forbidden. Union of the Opposition Lutheran and Calvinist groups in South Germany and of the United Church in the north was brought about at a meeting of Opposition pastors at Augsburg on June 5 and 6. They drew up another manifesto vigorously defending religious freedom and liberty of ecclesiastical instruction, which was read at a great rally in Berlin on July 21. The banishment of pastors from their parishes and other coercive acts by the secret police failed to daunt the Opposition leaders.

By the decrees of September 24 and October 3 Herr Kerrl was authorized "to issue decrees with the force of law, in order to restore order in the German Evangelical Church and in the Evangelical territorial churches." Under these laws Herr Kerrl on October 14 appointed a Reich Church Directorate of eight members to direct and represent the German Evangelical Church. Its extensive powers included the right to appoint and dismiss the officials of the church. In an effort to secure Opposition acceptance of government control, the Minister named to the directorate men who were either directly associated with, or sympathetic to, the Opposition group. As this action constituted open repudiation by the government of Reich Bishop Mueller and the "leadership doctrine" in church affairs, some Opposition groups were disposed to accept the new order as a compromise.

The directorate on October 17 proclaimed its support of "the National Socialist nation—a creation on the basis of race, blood, and soil." On the other hand it reaffirmed that Christ was the "Messiah and Savior of all nations and races" and His Gospel was "the inviolable foundation of the German Evangelical Church." The Reich government soon demonstrated, however, that it had not changed its determination to crush all opposition to its totalitarian views. In November the secret police closed two new independent theological seminaries of the Confessional Synods. The church conflict immediately flared up anew and Herr Kerrl then resorted to extreme dictatorial measures. On November 29 the secret police searched the Berlin headquarters of the Confessional Brotherhood and confiscated the funds of the Opposition churches and synods. When on December 1 the Opposition leaders read declarations in their churches accusing the government of aiding the introduction of heresy into German Protestant teachings, Kerrl prohibited "church associations or groups" from exercising executive or administrative functions, on pain of dissolution. This decree, which if enforced meant the complete crushing of the Opposition pastors and their movement, was met by open defiance on the part of the Confessional groups. They performed executive and administrative functions in direct violation of the decree, but at the cost of arrests, banishment from their parishes, and loss of their salaries. As the year closed their resistance was seriously weakened by the defection of Dr. August Marahrens, Bishop of Hanover and Presiding Bishop of the Confessional Church, who on December 13 voted to cooperate with Herr Kerrl and his directorate in an effort to restore peace and unity among the Protestant groups.

The Conflict with Catholicism. While realizing the impossibility of "coordinating" the Catholic

Church with the Hitler régime, the Nazis followed a policy of restricting Catholic activities, of discrediting the church with the German people, and of extending their control over Catholic youth. The Catholics held that these attacks upon them were in contravention of the Concordat between the Hitler Government and the Vatican, effective Sept. 10, 1933, which recognized as legitimate Catholic organizations having a religious objective. During 1935 the Catholic youth groups were increasingly molested by the Hitler youth organizations. The authorities also curtailed the activities of the Catholic groups and by July, 1935, the latter were forbidden to engage in sport or in social and educational programmes. The antagonism aroused among the Catholics was increased by the anti-Christian trend within the Hitler Youth movement and the support given the neo-pagan movement by high state officials.

Alfred Rosenberg's anti-Christian activities as cultural dictator of the Reich were particularly obnoxious to the Catholics. The announcement that he proposed to speak in Münster led the Catholic Bishop of that diocese early in July to protest in a pastoral letter that the speech would be an "unbearable provocation" to the Catholic public and an insult to their "most sacred religious convictions." Rosenberg spoke in Münster nevertheless. His denunciation of the Bishop's protest as an incitement of Catholics against the government was reiterated by Minister of Interior Frick. Herr Frick declared all Reich laws, including the sterilization and foreign exchange measures, were binding upon Catholics and ordered prosecution of those opposing their enforcement. He warned that the Catholic occupational and youth groups were "often active in fields which the Nazi state must reserve for itself."

On July 16 the Vatican formally protested against alleged violations of the Concordat. It charged that the sterilization of Catholics, interference with Catholic lay organizations, and censorship of the Catholic press were all violations of the Reich's obligations. Two days later occurred Herr Kerrl's appointment as Minister of Church Affairs, with control over both the Protestant and Catholic churches. At the same time General Goering, with Hitler's approval, issued a decree ordering the authorities "to employ all their legal weapons against members of the Catholic clergy who falsely employ the authority of their spiritual position for political purposes." He charged that priests had openly denounced Reich institutions and laws from the pulpit. The Nazis, he declared, "allow the Catholic as well as the Protestant church complete liberty in faith and teaching," but that politically only the National Socialist idea of the state was possible in Germany. Another decree of July 26 restricted the activities of all religious organizations.

This decree was followed by a wave of attacks upon Catholic lay organizations and the arrest or gagging of the more outspoken among the priesthood. The prosecution of priests, monks, and nuns for the smuggling of foreign exchange out of the Reich in violation of the exchange control laws continued throughout the year. Many of them were sentenced to long prison terms. The total fines imposed upon Catholic orders for such smuggling were estimated at about 5,000,000 marks. The Nazi press gave these trials wide publicity in an effort to discredit Catholic priests and leaders. On November 23 the secret police raided the offices of the Catholic Bishop of Berlin, seized

numerous documents, and took an attaché into protective custody. Thus the year closed with the struggle between the Reich and the Catholic Church assuming an ever more serious aspect.

Anti-Jewish Measures. Lacking the numbers and position of the Christian denominations in Germany, the Jews during 1935 felt the full force of the anti-Semitic sentiments obsessing Hitler and his associates. The highly discriminatory measures placed in operation during 1933 and 1934 were extended. Commencing July 15 a series of organized anti-Jewish riots occurred in Berlin. Jews were dragged from cafés and stores and beaten in the streets by Nazis led by uniformed Storm Troopers. The riots were preceded by inflammatory articles in the controlled Nazi press, inciting the people to action against the Jews. Julius Streicher of Nuremberg, most notorious of the Nazi Jew-baiters, made a number of anti-Jewish speeches in Berlin to large audiences. These developments led Dr. Hjalmar Schacht, Reich economic dictator, in a speech at Koenigsberg on August 18 to protest against illegal anti-Jewish measures on the ground that they endangered German trade relations, discouraged the tourist trade, and in general complicated the difficult economic problems of the Reich.

Nevertheless measures legalizing existing discriminations against the Jews and imposing new ones were adopted by the Sixth Nazi Party Congress at Nuremberg on September 10-16. So-called "pure" Jews were deprived of German citizenship, placed in a subordinate position as "state members," forbidden to marry or have extra-marital relations with Aryans or to employ Aryan domestic help under the age of 45, and forbidden to display the national flag. Jewish children also were segregated in separate schools. Executive decrees of November 15 amplified and in some respects modified the Nuremberg anti-Jewish decrees. These measures apparently aimed at the assimilation into the German population of persons of mixed Jewish and Aryan blood and the complete eradication of unmixed Jews and 75 per cent Jews. The economic position of the latter was made increasingly difficult by continuance of the boycott in many communities, with the tacit approval of the Reich authorities. See **Jews**.

The Nazi-Army Conflict. Although the effort of the Storm Troop leaders to win a controlling position in the regular army had been ended by the "purge" of June 30, 1934, friction between the Reichswehr and the Nazi party continued. Hitler's Special Guards, or Black Shirts, forming a kind of secret party police, had been greatly expanded and with the growth of their power the Special Guards had shown a desire to be placed on a par with the regular army in the matter of heavy armaments. On Jan. 3, 1935, a meeting of high army and navy officers and of Nazi leaders from all parts of Germany was suddenly and mysteriously convened in the Berlin Opera House. Even Nazi journalists were excluded, but according to later reports the meeting was for the purpose of clarifying relations between the army, the Special Guards, and the National Socialist party. Hitler, it was officially indicated, assured the army that its position as defender of the Reich and the sole bearer of arms was unchallenged, thus relegating the Special Guards and the remnants of the Storm Troops to a secondary position. At the same time he asserted the

party's complete mastery over political affairs of the Reich.

Subsequent developments confirmed the army's victory over the party military formations. The reintroduction of military conscription on March 16 in place of the small professional army authorized by the Versailles Treaty gave the army the task of creating the new German military machine. It was predicted that the exercise of this function eventually would lead the army to encroach to a vital degree upon the National Socialist party's political control. The new army law of May 21 provided for one year's active training of all able-bodied non-Jewish Germans between the ages of 18 and 45. After his year in the army, during which he owed undivided loyalty to his military superiors, the conscript passed into the Reserve until reaching the age of 35, when he became a member of the Landwehr. During all this period the army retained certain supervisory powers over the conscript.

A decree of November 28 established a trained reserve, consisting of all men not actually serving in the army, who were to be kept at a high level of efficiency through annual training. On December 21 the army won a still more important victory over the party when orders were issued by Gen. Werner von Blomberg, the chief of staff, for the incorporation of all men who passed through the army in a nonpolitical "Soldiers' League." The Soldiers' League thus took the place of the Stahlhelm and various other veterans' organizations which had been suppressed by the government. It placed virtually the whole of the German male population under the army's control, with the explicit agreement of Chancellor Hitler. Gen. Werner von Fritsch, commander-in-chief of the army, was named head of the Soldiers' League; he was responsible for his conduct of the organization to the chief of staff and not to the National Socialist party. The general staff, it should be mentioned, had been reconstituted on October 15, thereby abrogating another provision of the Versailles Treaty. Likewise affecting the army-party relations was the adoption by the law of Sept. 15, 1935, of the swastika as the official Reich and national flag. The black, white, and red colors of the former empire were retained for decorative purposes.

Unrest Reported. In addition to the opposition of Protestants and Catholics to the totalitarian tendencies of the state, evidences increased towards the end of the year that Social Democrats, Communists, and other elements suppressed by the Nazis were carrying on an active underground propaganda against the régime. The clue to the extent of this activity was afforded by numerous mass trials of Marxist and others reported in the Nazi press. The food shortage and rise in prices of staples accentuated the unrest. Foreign travelers reported that grumbling at one feature or another of Nazi rule was fairly widespread, but it was not believed that this discontent had assumed a really critical form.

Economic Trends. The economic situation during 1935 reflected the continuance of the factors which affected the development of Germany during the preceding year (see 1934 YEAR BOOK, p. 273). Industrial activity was confined largely to the heavy industries involved in the government's programme of rearmament and public works. The consumer goods industries lagged behind, partly on account of low purchasing power, which was further depressed by the rise in prices. Neverthe-

less it was officially estimated that the quantity of industrial output during 1935 was 95 to 96 per cent of the peak output of 1928, compared with a 1934 production which was 83 per cent of the 1928 level. The value of the 1935 industrial production increased about 500,000,000 marks over that of 1934. As in 1933 and 1934, government expenditures continued in 1935 as the principal stimulus to industry, representing more than 75 per cent of the total investments (about 70 per cent in 1934). The average number of unemployed was reported at 2,146,935 for 1935, against 2,657,711 in 1934 and 5,579,858 in 1932. The figure for Dec. 31, 1935, however, was but 97,000 lower than that for Dec. 31, 1934.

The Reich's foreign credit reached a new low level, with its most desirable obligations—the Dawes and Young Plan bonds—bringing 37 and 27, respectively, in New York toward the end of the year. Unable to borrow abroad, Germany undertook to finance needed imports of raw materials and food by forcing a favorable balance of trade. A subsidy scheme, placed in effect in June, enabled exporters to sell in foreign markets below cost, if necessary. Funds for these subsidies were obtained by a levy on German industries, estimated at 7 per cent of the annual turnover. Dr. Hjalmar Schacht, the Reich economic dictator, also encouraged exports by ordering the restriction of public contracts to firms with successful export businesses.

Although the 1935 foreign trade balance was favorable by 111,000,000 marks, against an unfavorable balance of 284,000,000 marks in 1934, the balance of foreign payments in general showed signs of further deterioration. The accumulated commercial indebtedness of Germany to other European countries was estimated at 500,000,000 marks at the close of 1935, having shown little decrease during the year.

Another source of weakness to the Nazi régime was the growing difficulty of short-term financing of expenditures, which accompanied the rapid growth of the public debt. This made it necessary for the government to monopolize all capital resources in the interest of public credit and of its successive consolidation loans. By the decree of October 18 all State banks were placed under Dr. Schacht's direct control. The gold reserves rose from 80,000,000 marks in January, 1935, to 95,000,000 in July and August, and then declined to 82,000,000 marks in December. The gold cover for the outstanding note circulation on November 23 was only 2.46 per cent. The heavy depreciation of Reichsbank notes in most European financial centres led the government on December 1 to prohibit the reimportation of marks circulating abroad. The mark thus became a purely domestic currency, whose value was fixed by government decree rather than by its intrinsic worth.

Foreign Relations. In contrast with his lack of definite success in dealing with economic problems and religious difficulties at home, Hitler's foreign policy during 1935 was marked by successive resounding triumphs which greatly strengthened his prestige both at home and abroad. The first of these was the overwhelming victory of the Reich in the Saar plebiscite of January 13, followed by the reincorporation of the Saar in Germany on March 1 (see SAAR). Hitler then proceeded by unilateral action formally to scrap those provisions of the Versailles Treaty restricting German armaments. Secret rearmament had been under way since the advent of the Nazi régime,

but it was not until 1935 that the Versailles bonds were publicly repudiated. On March 11 the Fuehrer announced the existence of a substantial German air force and on March 16 he decreed the reintroduction of military conscription and the establishment of a German fighting machine of 12 corps and 36 divisions—between 550,000 and 600,000 men. Towards the end of April it was officially announced that the construction of submarines and other naval units were under way. Thenceforward the building and supplying of the new military, air, and naval machine went forward openly and at top speed.

The resurgence of German military power had profound repercussions upon the diplomatic alignment of Europe. It was the principal factor behind the Franco-Italian rapprochement of Jan. 7, 1935, the establishment of a united front against Germany by Britain, France, and Italy at the Stresa Conference on April 11-14, the Franco-Soviet mutual assistance pact signed May 2 and still awaiting ratification by the French Parliament at the end of the year, the conclusion of a similar pact between Czechoslovakia and the Soviet Union, and the feverish expansion of armaments by practically all of the European powers to meet the threat implicit in German rearmament.

By the extension of her system of alliances to include Italy and the Soviet Union, France completed the encirclement of Germany. But the ring around the Reich was far weaker than it appeared on paper because of mutual hostilities and conflicting interests among the allies. Taking clever advantage of these divisions, Hitler had detached Poland from France in 1934. In 1935 he drove a wedge between France and Britain by the Anglo-German naval treaty and the tension between Britain and Italy over Ethiopia completed the breakdown of the so-called Stresa front. With France rendered weak and ineffectual by factional strife and economic difficulties, Hitler was able to carry through successfully his bold repudiation of the Versailles Treaty in open defiance of France and her allies. He sidestepped all efforts to force him to recognize the *status quo* in Central and Eastern Europe where lay the regions of prospective German expansion mentioned in Hitler's biography, *Mein Kampf*.

Realizing that German rearmament was already far advanced, Britain and France at the beginning of 1935 initiated efforts to reach an agreement with Germany on the basis of the equality previously denied her. The British Foreign Secretary, Sir John Simon, arranged to visit Berlin on March 7 to discuss the matter. On March 4, however, there was published a British White Paper on imperial defense which stated that an increase in British armaments was necessary in view of military preparations in other countries, particularly in Germany. Angered by this implied refusal to recognize German arms equality, Hitler abruptly postponed his conference with Sir John Simon. On March 16 he suddenly announced the reintroduction of military conscription, causing a grave crisis in Europe. The French and Italian protest against this unilateral repudiation of the Versailles Treaty was brought before the League Council, which on April 16 adopted a resolution of censure upon Hitler's action. The latter on April 20 rejected the resolution "in the most resolute manner" and condemned this effort to pass judgment upon Germany.

Meanwhile the Simon-Hitler conversations had taken place in Berlin March 25-26. Hitler in-

formed Simon of his refusal to participate in the proposed multilateral pact guaranteeing the territorial *status quo* in Eastern Europe. Although favoring bilateral non-aggression pacts between the powers interested in Eastern Europe, he declined to sign such pacts with Lithuania or the Soviet Union. Hitler offered to accept a system of permanent and automatic arms supervision applying equally to all powers, but declared Germany would not return to the League of Nations until she obtained full "equality" with the other powers, including the restoration of some colonies. The Fuehrer further expounded his foreign policy in a speech to the Reichstag on May 21. He promised to fulfill the Locarno treaties of 1925 "as long as the other signatories uphold them," including acceptance of the demilitarization of the Rhineland. He further promised that he would respect all clauses of the Versailles Treaty, including the territorial provisions, except the military provisions which had just been repudiated.

Hitler in his Reichstag speech also renewed his previous bid to conservative elements in Europe to make the new German army a bulwark against communism. He aimed at the establishment of an anti-Soviet bloc including Poland, Finland, Hungary, and Italy, which, if British neutrality could be secured, might win the next European war. France's answer to this proposal was the signing of the Franco-Soviet pact of May 2. On June 18 the Reich scored a notable diplomatic triumph by concluding a naval agreement with Britain in which Hitler agreed to limit the proposed German fleet to 35 per cent of the British naval tonnage. By thus giving official recognition to Germany's violation of the naval clauses of the Versailles Treaty, Britain nullified the Stresa agreement for joint opposition to German rearmament.

With the weakening of France and the absorption of Britain and Italy in their quarrel over Ethiopia, Central Europe became the diplomatic battleground between Germany and the Soviet Union. The smaller States and combinations, such as the Little Entente, Balkan Entente, and Baltic Entente, were weighing the relative advantages of cooperation with the League of Nations, the Soviet Union, and the Reich. While waiting for the time when her full military power would attract powerful allies and enable her to pursue her aims in Central and Eastern Europe, Germany turned her attention to the most promising areas for immediate action, namely Memel, Danzig, the districts of Eupen and Malmédy in Belgium, Schleswig in Denmark, and Czechoslovakia. In all of these regions the activities of German minorities in favor of reincorporation in the Reich received powerful political and financial support from the Nazi régime.

Memel was the storm centre of this agitation during 1935. The conflict between the German minority in Memel and the Lithuanian Government, which assumed an acute form beginning in 1933, culminated in the mass trial of Memel Nazis at Kaunas on charges of conspiring to overthrow Lithuanian sovereignty. The verdicts, handed down on Mar. 25, 1935, aroused a storm of fury in the Reich. The agitation against Lithuania (q.v.), backed by the powerful Nazi propaganda machine, continued throughout the year. Concentrations of troops near the Lithuanian border and the more elaborate military preparations made in East Prussia than in the rest of Germany lent a menacing aspect to these developments. See MEMEL.

In Danzig (q.v.) the attempt of the Nazi government to amend the democratic constitution so as to coordinate the Free City more completely with National Socialist principles was checked by the failure to secure the necessary two-thirds majority in the Diet in the elections of April 7. This result, in a community overwhelmingly German, was viewed as a rebuff to Hitler and his Nazi movement. The victory in the Saar was followed by intensified Nazi propaganda in Eupen and Malmédy directed from the German city of Aix-la-Chapelle. The Nazis were reported to have resorted to terrorization of their opponents, leading the Belgian police to arrest a number of Hitlerite agitators. Nazi propaganda also made rapid headway among the German minority in Czechoslovakia (q.v.) under the leadership of Konrad Henlein. While Henlein professed loyalty to the Czechoslovak state and to democratic principles, it was believed that his Sudeten German party would eventually serve as a basis for Nazi territorial demands in the German-speaking regions of Czechoslovakia.

In Austria (q.v.), the absorption of which had been the chief aim of German policy in 1934, the Nazi movement remained relatively quiescent during 1935 under the threat of Italian intervention. The ousting of Colonel Emil Fey and other German sympathizers from the Austrian Cabinet in the autumn of 1935 further reduced Hitler's influence. For Nazi agitation in various other countries, see BELGIUM, ESTONIA, FINLAND, LATVIA, the NETHERLANDS, and SWEDEN under *History*. The officially inspired agitation for colonial possessions also gained momentum during the year and there were indications that the European powers might seek to satisfy this demand at the expense of Portugal.

See AUSTRIA, FRANCE, GREAT BRITAIN, HUNGARY, ITALY, POLAND, RUMANIA, SOUTH-WEST AFRICA, and YUGOSLAVIA under *History*; *PHILOSOPHY*.

GIANT TOAD CONTROL OF INSECTS. See ENTOMOLOGY, ECONOMIC.

GIBRALTAR. A British crown colony and fortified naval base. Area, 17½ sq. miles; total civilian population (Jan. 1, 1935, est.), 15,847 (of whom 14,790 were fixed residents) exclusive of some 1500 British subjects and 4500 aliens from the nearby Spanish town of La Linea who entered Gibraltar each day. In 1934, there were 13 government-aided elementary schools with 2687 students enrolled, and 4 secondary schools.

Trade. The principal trade was the supply of coal, fuel oil, and provisions to shipping, and the transit of cargo to Spain and Morocco. No land was available for agricultural development. Fishing was carried on by local boats for home consumption. Boat building, ship repairing, and the manufacture of tobacco were carried on. During 1934, 6316 ships aggregating 11,563,598 tons entered the port. The Admiralty harbor was 440 acres in extent and contained three graving docks.

Government. Revenue was derived mainly from import duties, the rent of government property, and port dues. In 1934, revenue amounted to £245,858; expenditure, £275,644. The colony was administered by a governor who was also the general officer commanding the garrison. He was aided by an executive council of seven members. Legislative power was vested in the governor. Governor in 1935, Gen. Sir C. H. Harington.

History. As one of the key defenses of the British Empire's sea lane to Egypt and India, Gibraltar

became the centre during 1935 of the intense British naval and military preparations carried out in the Mediterranean as a result of the development of the Anglo-Italian crisis over Ethiopia (q.v.). The British main fleet, transferred to the Mediterranean beginning in July, used Gibraltar as one of its principal bases. At the same time the garrison was heavily reinforced, extensive naval and air manoeuvres were carried out in the vicinity, and the civil population was trained in preparation for possible air and gas attacks. See GREAT BRITAIN and ITALY under *History*.

GILBERT AND ELLICE ISLANDS. A British colony in the mid-Pacific, comprising the Gilbert group (16 coral atolls) and Ellice group (9 coral atolls) and including the distant Ocean, Fanning, Christmas, and Washington islands. Total area, 200 sq. miles; total population (Jan. 1, 1935 estimate), 34,337 including 238 Europeans. The chief products for export were copra, and phosphate of lime (from Ocean Island). In the year ended June 30, 1934, imports were valued at £94,429; exports, £259,843; revenue, £45,359; expenditure, £53,299. The colony was administered by a resident commissioner (with headquarters on Ocean Island) under the British High Commissioner for the Western Pacific who resided in the Fiji Islands.

GILES, JILZ, HERBERT ALLEN. A British Orientalist who died at Cambridge, England, Feb. 13, 1935. Born on Dec. 8, 1845, he was educated at the Charterhouse School in London. He began his career by joining the consular service in 1867, became vice consul at Amoy, 1878; Pagoda Island, 1880; Shanghai, 1883; consul, Tamsui, 1885; and Ningpo, 1891. In 1893 he resigned from the service to devote his time to his monumental *Chinese-English Dictionary* on which he had begun to work in 1874. It was first published in fascicules in 1892, was revised and enlarged in 1912, and was awarded the Prix St. Julien of the Académie Française in 1911. In 1897 he became professor of Chinese at Cambridge University and retired in 1932.

Dr. Giles was the first lecturer of the Dean Lung Foundation at Columbia University in 1902, his lectures on *China and the Chinese* being issued later in book form, as were his Hibbert Lectures of 1914 *On Confucianism and Its Rivals*, issued in 1915. In 1904, the North China Branch of the Royal Asiatic Society elected him an honorary member and in 1917 he was elected an honorary fellow of the Asiatic Society of Bengal. The Royal Asiatic Society awarded him its Triennial Gold Medal in 1922—the first time granted for Chinese studies—and the President, Lord Chalmers, in presenting the award, said: "We ask you to accept it from us as a tribute to the ripe scholarship and literary insight with which, amid the exacting duties of an honorable career as Consul in China, you have garnered for us so abundant a harvest from over half a century's labor in the field of Chinese language, Chinese history, and Chinese literature." The following year he was decorated by the Chinese Government with the Order of Chia Ho, 2nd Class, with Grand Cordon, and in 1924, was elected to the French Academy.

Dr. Giles' many works include: *Chinese without a Teacher* (1872, 8th ed., 1922); *Colloquial Idioms* (1873); *Two Chinese Poems* (1873); *Chinese Sketches* (1876); *Handbook of the Swatow Dialect* (1877); *Glossary of Reference* (1878, 3d ed., 1900); *Historic China* (1882); *Gems of Chinese Literature* (1884, enlarged ed., 1922); *Chuang Tzu* (1889, 2d ed., 1925); *A Chinese Biographical Dictionary* (1897), which also received the Prix St.

Julien; *Chinese Poetry in English Verse* (1898, enlarged ed., 1923); *Elementary Chinese, The San Tsü Ching* (1900, 2d ed., 1923); *Introduction to the History of Chinese Pictorial Art* (1905, 2d ed., 1918); *Religions of Ancient China* (1905); *Chinese Fairy Tales* (1911); *China and the Manchus* (1912); *Adversaria Sinica* (1st series, 1914, 2d series, 1915); *Some Truths About Opium* (1923); *Chaos in China* (1924); *The Hsi Yuan Lu* (Chinese Instructions to Coroners) (1924); *Quips from a Chinese Jest-Book* (1925). Also, he contributed, "Arts, Language, Literature, and Religions of China," in conjunction with his son, Dr. Lionel Giles, to the *Encyclopædia Britannica* for 1912; the article, "China," to the *History of the Nations* (1913), and the article "China and the Chinese" written especially for children, to *St. George's Magazine*, 1912.

GILES, PETER. A British philologist, died at Cambridge, England, Sept. 17, 1935. He was born at Strichen, Aberdeen on Oct. 20, 1860, and educated at the University of Aberdeen and at Gonville and Caius College, Cambridge, and subsequently at the universities of Freiburg and Leipzig. In 1884 he was Browne Medalist, and the following year, Lightfoot Scholar and Whewell Scholar.

In 1887, Dr. Giles became associated with Cambridge University, first as a fellow of Gonville and Caius College and three years later as a fellow of and classical lecturer at Emmanuel College. In 1891 he became reader in and from 1911 master of comparative philology at the College, a position he held for over 40 years. From 1919 to 1921 he served as vice chancellor of the University, and as a member of the statutory commission from 1923 to 1927. He was the commencement day speaker at Radcliffe College, Cambridge, Mass., in 1927.

As an educator and teacher, Professor Giles had an international reputation, and his philological and historical studies won for him an honored place in the world of research. He was a frequent contributor on philological subjects to the *Proceedings and Transactions* of the Cambridge Philological Society, the *Classical Review*, *Historical Review*, etc., and wrote articles on the alphabet, Greek Language, and philological subjects for the 11th edition of the *Encyclopædia Britannica*, as well as contributions to *Hastings' Dictionary of Religion and Ethics*. He supplied the chapters on "Languages" in *Whitley's Companion to Greek Studies* (with the late R. A. Nell) and *Sandys's Companion to Latin Studies*; "The Earliest Scottish Literature" in the *Cambridge History of English Literature*, vol. ii; "The Aryans" in the *Cambridge History of India*, vol. i; "Peoples of Asia Minor and Europe," two chapters in the *Cambridge Ancient History*, vol. ii; and the article "Philology" (in part), in *Chambers's Encyclopædia* (1926). He also wrote the standard English textbook, *A Short Manual of Comparative Philology* (1895, 1901; German ed., 1896), a new edition of which was in the course of preparation at his death.

GILLETT, FREDERICK HUNTINGTON. An American ex-Congressman and ex-Senator, died at Springfield, Mass., July 31, 1935. He was born in Westfield, Mass., Oct. 16, 1851, and was graduated from Amherst College in 1874 and Harvard Law School in 1877, being admitted to the bar in that year. He began the practice of law at Springfield, but soon turned to politics, and in 1879 became an Assistant Attorney General for Massachusetts. Upon the expiration of his term in 1882, he resumed his law practice, but politics again claimed him and

he became a member of the Massachusetts House of Representatives in 1890 and 1891.

In 1893, he was elected to the 53d Congress and began a long service in the House of Representatives. During his tenure of office, he served on many important committees, including that of Appropriations, becoming the ranking Republican member, Judiciary, Foreign Service, and Civil Service Reform. In 1914, he favored the Panama Canal Tolls Repeal Bill and was opposed to the Government's Mexican policy. While serving on the Appropriations committee during the World War, he cooperated with the Administration and voted for funds for the War, but fought against any measure that threatened to give to the President further power. During this period he was minority floor leader and when the Republican Party returned to power in 1919 was elected Speaker of the 66th Congress, and subsequently of the 67th and 68th Congresses.

Being prevailed upon to run for Senator, he resigned from the House in 1925, and was elected to the Senate for the term beginning Mar. 4, 1925, and ending Mar. 3, 1931. While serving in the Senate, Gillett favored adherence to the World Court, although he opposed the League of Nations. He followed his party's leadership in opposing the repeal of the 18th Amendment and the Volstead enforcement act. In 1931 he refused to accept renomination and retired, in order to devote his time to writing the biography of Sen. George F. Hoar of Massachusetts and his own memoirs. The former book appeared in 1934, but his memoirs were uncompleted.

GIRL SCOUTS. A nonsectarian movement for girls from 7 to 18, started in Savannah, Ga., in 1912 by Mrs. Juliette Low and adapted from the scouting programme begun in England in 1907 by Lord Baden-Powell. It is a leisure-time programme which supplements the work of the church, the home, and the school and encourages girls to learn and practice the cultural and domestic arts that were part of the old-fashioned home's training. The active, paid-up memberships as of Oct. 31, 1935, totaled 375,472, inclusive of Brownies (girls between 7 and 10) and leaders.

The official organ for girls is the *American Girl Magazine*, and for leaders, the *Girl Scout Leader*, each a monthly publication. The national officers in 1935 were: Honorary president, Mrs. Franklin D. Roosevelt; chairman of the board of directors, Mrs. Nicholas F. Brady; president, Mrs. Frederick Edey; secretary, Mrs. Thomas J. Watson; treasurer, Mrs. Edgar Rickard. Mrs. Paul Rittenhouse is national director. Headquarters are at 570 Lexington Ave., New York City.

GLAZEBROOK, SIR RICHARD TETLEY. AN English physicist, died at Limpsfield, Surrey, Dec. 16, 1935. He was born in West Derby, Liverpool, Sept. 18, 1854, attended Liverpool College and graduated from Trinity College, Cambridge with honors in 1876. In the following year he became a Fellow and in 1881 served as a lecturer in mathematics, becoming senior bursar in 1895. He became a demonstrator in physics at the Cavendish Laboratory in 1880 and in 1890 was appointed assistant director.

Selected as principal of University College in Liverpool in 1898, in the following year he was appointed director of the National Physical Laboratory, which post he held throughout the War, retiring in 1919 to become Zaharoff Professor of Aviation and Director of the Department of Aeronautics at the Imperial College of Technology, London, which he held until 1923. During the World War, he rendered the Government great

service in his examination and testing of munitions, and in 1917 he was knighted, becoming Knight Commander of the Bath in 1920 and Knight Commander of the Victorian Order in 1934. He visited the United States in 1926 as a delegate to the International Electrotechnical Convention held in New York City.

Among the more important researches of Dr. Glazebrook were those dealing with the absolute resistance of the British Association unit and the specific resistance of mercury, a dynamical treatment of the theory of double refraction, a verification of Fresnel's theory of double refraction in a biaxial crystal, and other investigations dealing mainly with optics and electricity. For his scientific researches he was Hughes Medallist of the Royal Society (1909); and received the Albert Medal of the Royal Society for his application of natural science to industry (1918); the Royal Medal in 1931, and the Gold Medal of the Royal Aeronautical Society (1933). In 1917, he was Rede Lecturer at Cambridge.

For many years Sir Richard was actively engaged in various organizations, being president of the Institute of Electrical Engineers (1906); Chairman, Aeronautical Research Commission (1908-33); Foreign Secretary, the Royal Society, (1926-29); Member of Statutory Commission for the University of Cambridge (1924); and Member of Standing Commission on Museums and Galleries (1931).
